The Moon collection, probably the most complete in existence of the Indians of the Southwest, and the only one of its kind which perpetuates for all time a record of Pueblo Indian life, is said to have brought a record-breaking price. It will be housed with the world's greatest treasures of books, manuscripts and paintings second only in importance to that of the British Museum, on the estate of five hundred acres which Mr. Huntington gave recently to the American people under a deed of trust to be administered by a board of self-perpetuating trustees.

The Moon collection will be housed on the same estate with Gainsborough's "Blue Boy," the most costly painting in the world, known to art lovers as "the million-dollar masterpiece." In addition to the purchase of the entire photographic collection, Mr. Huntington has commissioned Mr. Moon to make twelve paintings in oil of certain subjects in the collection to be selected by the purchaser. To do this, Mr. Moon again will visit the Pueblo country, some time early in the autumn.

The artist who dreams of an American art, the photographer who seeks new subjects, and the student who would preserve for future generations something tangible as a link between the pre-Caucasian period of North America and our own time, can find no greater wealth of material than in this land of the Pueblo, says the artist. There Carl Moon found inspiration for serious work which has gained for him a place in American art.

"I have traveled this country thoroughly in my work making serious photographic records of the Indian people," says Mr. Moon, "and as I have sought material to be used for its ethnological as well as art value, I have had to come into close contact with the people and their ways of life.

"As a class, the Pueblo Indians are less prejudiced against the camera than the Plains tribes. When I began my work twenty years ago, my mode of travel was by pack mules and horses. I was obliged to penetrate wild and open country for many miles, where probably few white men ever had been. It was no easy matter in those days to gain the confidence of the Pueblos, for they were sensitive and superstitious. Peaceful and patient, though with much misgiving as to the paternalism which the United States Government had thrown about them, the Pueblos, when I first visited them, plied their ancient arts and industries, satisfied to be left alone with their arid land, their patches of corn and their own ideas of life.

"The twenty-five villages extending from Taos in the northern part of New Mexico to Oraibi, the ancient Hopi village of Western Arizona, have widely different locations in point of natural surroundings. The former pueblo stands in one of the most beautiful valleys in the Southwest, while the latter is perched upon a giant rib of barren rock that projects into the parched sands of the Painted Desert. Santa Clara, San Juan, San Ildefonso, Isleta and Laguna, squatting flat upon the very banks of the Rio Grande, have neither view nor vegetation.

"The Pueblo Indian as I first found him was a compelling figure. His mythological religion—a heritage handed down through the vicissitudes of many generations—had marked him with a weird superstition. His prayer ceremonies were then, and are even now, often incongruous, frequently spectacular, and always interesting. Inseparable from the atmosphere of the turquoise sky, the purple shadows of the red-scarred cliffs and the delicate haze of the desert he fitted perfectly into his environment. His villages either were spread out over several rough semblances of roads or were built in pyramidal shape like huge blocks piled one on the other to a height of from three to five stories. In sharp contrast to the mud walls were the brilliant colors worn by the men, or perhaps it was a bright red shawl worn by a maiden who gracefully balanced a water jar on her head as she climbed the worn ladder to her second-story home. The Indians are much the same today as they were twenty years ago, except that most of them have discarded their tribal costumes for the more disengaging blue jeans and calico dresses from the looms of New England, and the older and more distinct types of bygone generations are no more."

CARL MOON,

The artist whose collection of Pueblo Indian pictures has been purchased by Henry E. Huntington.

When Mr. Moon first visited that ancient and strangely fascinating village of Acoma which rears its terraced buildings on the summit of a rock that stands 357 feet above the surrounding mesa, he was given his first insight into the communal life of the Pueblos. As the traveler approaches the village from the seventeen-mile drive from the Santa Fé station of Laguna, he passes Mesa Encantada ("Enchanted Mesa"), a great, flat-topped, circular rock rising with perpendicular walls to a height of about 400 feet above the plains. It was there that many of the pictures in the now world-famous collection were taken.

Mr. Moon visited Zuni, largest and dirtiest of all the pueblos, which lies about ninety miles west of Acoma and some thirty-five miles south of the town of Gallup, New Mexico, and there also found subjects for his camera. One hundred and fifty miles northwest of Zuni is Hopi land, where seven little villages rise hundreds of feet above the sands of the Painted Desert. These villages are the most isolated of the many which the artist visited, their nearest point to civilization being seventy miles from the railroad. Of the seven Hopi villages Mr. Moon found Walpi and Oraibi the most interesting, and in these some of the most noted of his pictures were made. The Navajo, Apache and Hopi tribes offered the best subjects for his work.

Mr. Moon's aim in making the pictures was to produce photographs that would form an ethnological record, and his faithful artistic results in delineating the last of a vanishing race at once attracted wide attention. Not only were his portrayals regarded as of great value from an ethnological standpoint, but they were also considered because of their sheer artistry to be a veritable monument to the patience and sympathetic understanding of the man who made them. Done in sepia, the effect of each photograph is more that of brush work on a sweeping canvas than of a reproduction from a photographic plate.

Establishing his headquarters at Grand Canyon in the heart of Arizona's wonderland, where he built himself a studio, Carl Moon lived and worked for years with his wife, Grace Moon, who also is an artist of note. Mr. and Mrs. Moon together traversed the great reaches of the Southwest, often being absent from their studio for months at a time.

"My aim always has been to portray the Indian faithfully," Mr. Moon told the writer; "to see beyond the exterior that usually masks his thoughts and sentiments; and, where it has been possible, to show him as he was before the inroads of civilization hampered his freedom, warped his views of life and changed his picturesque customs and modes of dress. I have always tried to keep my pictures free from evidence of the white man's presence, so that the awkward self-consciousness and artificiality that too often are apparent might give place to that freedom and ease which are so natural and pleasing a part of the Indian."

Living for months at a time among these strange and little understood people, Mr. Moon learned something of their language. Many obstacles at first encountered in the taking of the pictures hindered the progress of the work, and it was only because of the artist's infinite patience and a desire to get close to the hearts of his subjects that he was enabled ultimately to succeed in giving to the world a photographic record which but for his resolute determination would never have been made.

"As a general rule, when I first went among these people," Mr. Moon says of his earliest trips to these outposts of Indian life, "I was courteously received in their villages and I found them kindly disposed toward all who showed them an equal degree of kindness and consideration. They were very reticent when first approached, but when their friendship had been gained, they were delightfully responsive.

"Volumes could be written on the Hopi, with his ancient folklore, his mythology, his clans, and his weird religious ceremonies. Perhaps the snake dance, ending the nine days' ceremony that constitutes his great annual invocation to the Rain God, is the most spectacular and interesting. Although the old men, many of whom were the subjects of my earlier pictures, are now dead, their descendants still continue to observe the event with punctilious care and exactitude. With the passing of the old warriors have gone also most of the ancient tribal costumes—the varicolored blankets and the bright feathers that were so indispensably a part of the American Indian as he is associated in the mind of the average person. Modern influences have crept in to rob their descendants of much of that picturesqueness which I found in these quietly secluded villages two decades ago. During my more recent visits I found the men and the women clad after the fashion of the frontier American; but since I bought many of the old costumes and have preserved them all these years, I shall be able, fortunately, to reproduce in oil exact pictures, with fidelity to detail of dress, so essential to a faithful reproduction."

Pueblo Indian types, according to Mr. Moon, vary from the peaceful small-bodied Hopi to the powerfully built and more alert men of Taos and other northern Rio Grande villages. "Most of the tribes make pottery of various kinds," Mr. Moon explained; "the flat bowls of the Hopi, the painted ollas of the Acomas, and the glossy black water pots and double-necked vases of the Santa Clara being the best."

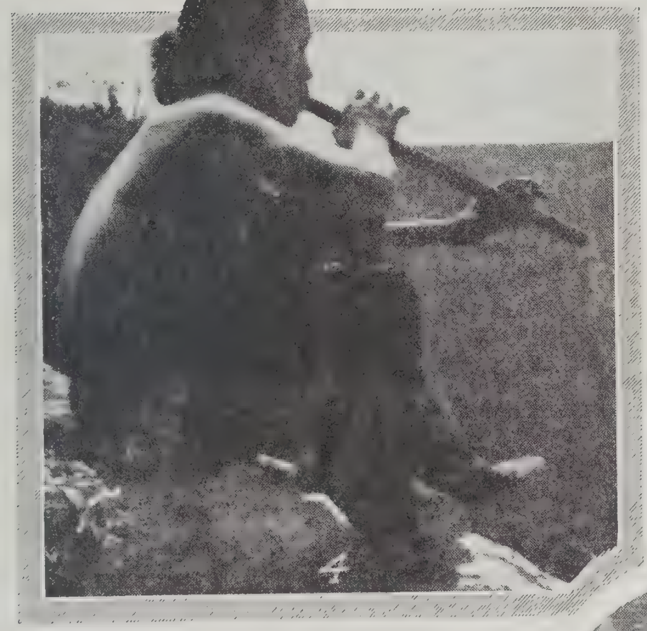
From time to time during the last twenty years the artist has exhibited his photographs at the National Art Gallery and at the New National Museum in Washington. President Roosevelt, always deeply interested in the welfare of the Indians, highly praised the Moon collection, and invited the artist to exhibit his pictures at the White House in 1906. Now that Mr. Huntington has given them a place in his great library, they have found a permanent home where the memory of a fast vanishing people will be forever perpetuated. In purchasing them for the benefit of future America, Mr. Huntington incidentally has made secure the fame of Carl Moon whose genius with camera and brush has given the artist a firm place in the hearts of art lovers everywhere.

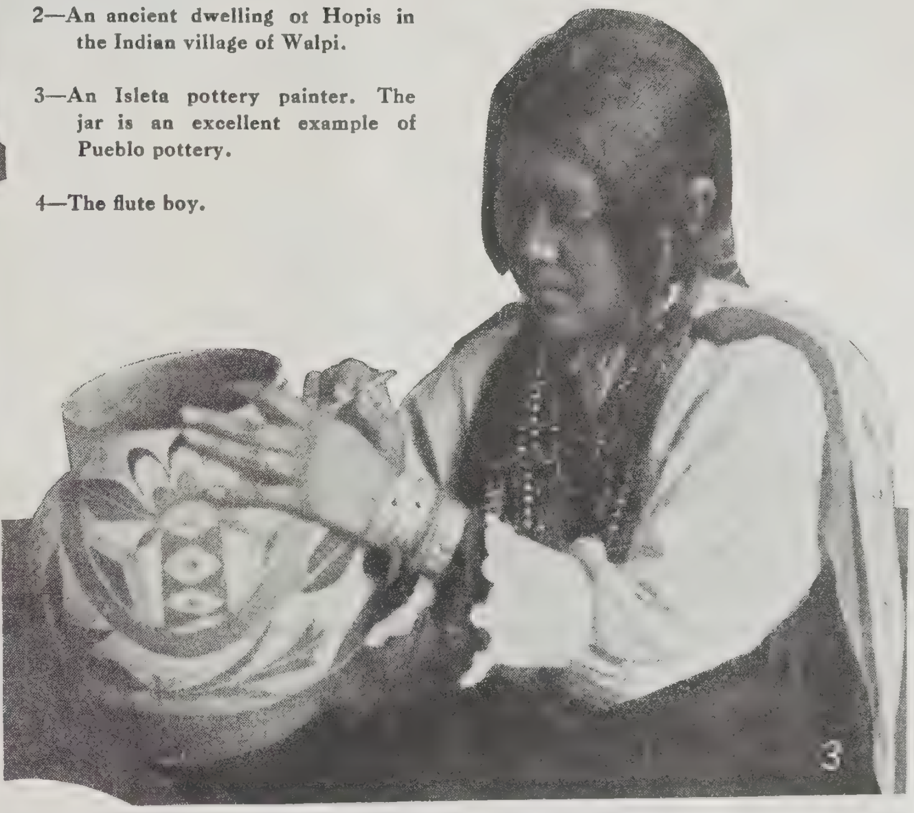
1—The conjurer.

2—An ancient dwelling ot Hopis in the Indian village of Walpi.

3—An Isleta pottery painter. The jar is an excellent example of Pueblo pottery.

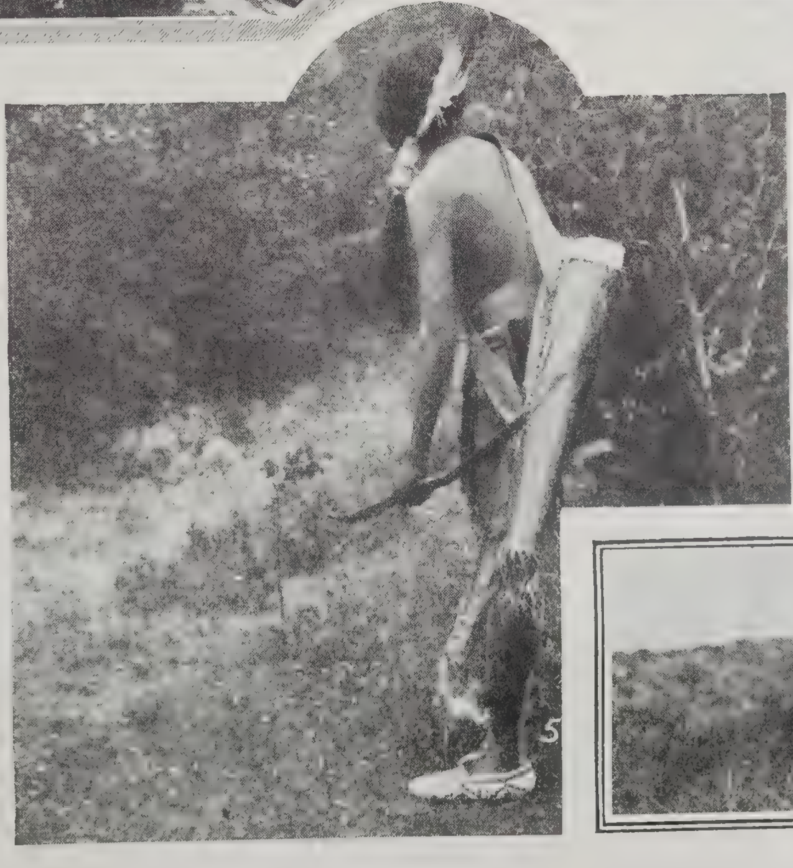
4—The flute boy.





Left—The hunter.

Right—A Hopi snake priest In his hand is a ceremonial bowl decorated with rain symbols. The inside of the bowl is decorated with paintings of frogs and tadpoles.



Comes Now the Banking Orator

By EARL CHRISTMAS

"Friends, Romans, countrymen, lend me your ears;
I come to bury Caesar, not to praise him.
The evil that men do lives after them—"

SO BEGAN the speaker, in the compelling words of Antony. No, it was not a school of expression in the university, nor a class in literature. It was an early morning meeting of officers and employes of the St. Paul Trust & Savings Bank. Yes, a school of oratory, if you please, in a bank! Or, more properly speaking, a school of public speaking adapted to banking, a unique enterprise that is accomplishing unusual results in this St. Paul bank.

"The good is oft interred with their bones—" resounded the words of the orator through the corridors of the bank. Strangely unfamiliar seemed these lines from Shakespeare here in a building devoted to the somewhat prosaic business of banking. One might expect to hear a sales talk in a business devoted to selling automobiles, say, but here in a bank to find men reciting Shakespeare, and during working hours, too—well, the matter called for investigation.

Seeking the reason for the establishment of the school, I was sent to Max G. Boecher, who has charge of new business, advertising and promotion work at the bank. Boecher was instrumental in the formation of the school, I was told.

"Isn't Julius Caesar a long way from banking?" I asked him.

Mr. Boecher is a young man, and he answered me in the flash of a second.

"Nothing is a long way from banking," he said, "Banking touches everything. It reaches all economic, political, civil and social life.

"Some of the boys in the bank suggested that very thing when we took up the study of Shakespeare. Some of them said they didn't like Shakespeare much, and thought we ought to study something more closely connected with our business.

"'We want to get away from business,' I told them 'The man who sticks too close to his business gets into a rut. He needs something like this to appeal to the finer side of his nature, to stir up his imagination. He will be a better banker as a result.'"

The St. Paul Trust & Savings Bank is a new bank, and it has new ideas.

"But this study of Shakespeare is only incidental to the main purpose of the class," Mr. Boecher hastened to explain. "The main object is to make public speakers of the men who work in the bank.

"The average banker is not a public speaker. Yet, there is no man who might better profit by effective speaking than the banker. That's why our school of public speaking came to be established."

This unusual school opens at 8:10 every morning, and lasts until 9 o'clock. The work of the bank employes is supposed to start at 8:30. So the men give 20 minutes of their time for the school, and the bank gives 30 minutes.

Each day there is one prepared talk. Recently, men in the different departments of the bank were giving talks on subjects connected with their work, or on other subjects with which they happened to be familiar. Occasionally, some famous oration is given by a member of the class.

"We are not trying to develop orators," Mr. Boecher said. "We are trying rather to prepare each one to get up in any kind of a gathering and make a talk creditable to himself and the bank. In a way, it is a peculiar kind of public speaking we are trying to develop. We are trying to develop public speakers for banking purposes."

Making Motion Pictures of the Bee

Films Reveal How "Each Shining Hour" Is Improved

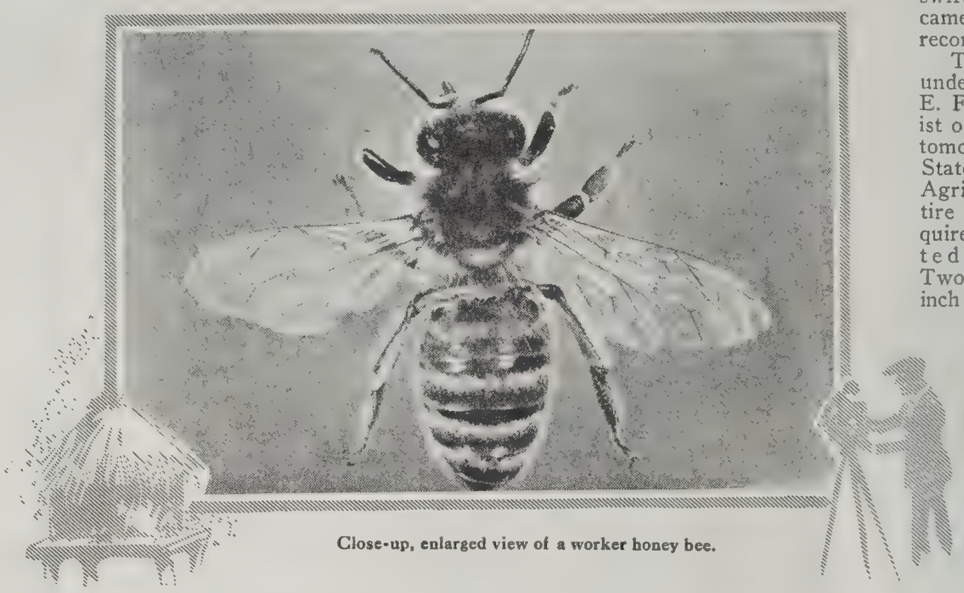
Symbolic of industry is the oft-quoted verse,

"How doth the little busy bee
Improve each shining hour,
And gather honey all the day,
From every opening flower!"

THE poet was speaking from casual observation. The United States Department of Agriculture has prepared two motion picture films of the honey bee and his proverbial habits of industry are reflected on the screen. These are faithful representations of the life and habits of the nectar-sucking insect, whose characteristics are for the first time to be minutely presented in motion pictures.

"Bees—How They Live and Work" is the title of one reel of film for popular distribution; while "Keeping Bees at Work" is the legend of another reel in which the science of bee-keeping is portrayed for the study of bee-keepers and apiculturists. At Somerset, Maryland, Uncle Sam maintains an extensive apiary devoted to the scientific investigations of bee culture. Here a motion picture photographer of the United States Department of Agriculture spent the major portion of the summer, in recording images of the tiny bee for exhibition on the screen.

H. K. Sloat, for ten years a motion picture photographer, admits that he never tackled such a tedious undertaking as that of visualizing the life habits of the bee. From the initial handicap of wearing a broad-brimmed hat with a bee veil which marred his vision in focusing the camera, to the menace from stings to the exposed portion of his body, his troubles ran the gamut of annoyances. He operated his camera fifteen feet from the hive, which was uncomfortable to a person unacquainted with the stinging proclivities of this busy worker.



Close-up, enlarged view of a worker honey bee.

From the moment the eggs are layed by the queen and the young bees are hatched, until the honey is in the comb and subsequently bottled for market, the life history of the bee is faithfully recorded on the film, "Bees—How They Live and Work." The behavior of this insect from morning until night is recorded, with the single exception that the vibration of the wings of the bee could not be visualized for display on the screen. The wings move at a speed of 600 vibrations a second, an action so swift that the particular camera in use failed to record the image.

The bees were filmed under the direction of E. F. Phillips, apiculturist of the Bureau of Entomology of the United States Department of Agriculture, and the entire summer was required for completing the tedious undertaking. Two two-inch, three-inch and six-inch lenses were employed at various times. An artificial swarm of bees was enticed to accumulate in a tree, the busy workers afterward being brushed off into a tin pan and removed to a hive. Here the motion picture photographer, with a piece of cardboard as a background, recorded the actions of the insects as they entered and departed from the hive. Bees in the process of hatching were recorded on the film, as well as individual scenes of the worker bee, queen bee, and drone bee. The swarming period was included in the scenes, as well as pictures of adult members of the bee family engaged in the nectar-gathering task for which this insect is so peculiarly endowed by nature.

The oddities of bee life are to be shown on the screen, as well as their conventional habits. Bees, during periods of drought, are deprived of sufficient nectar from flowers. As a means of completing their orderly process of honey production, they repair to pine trees, infested by aphids, an insect which excretes a sirupy substance. Bees gather this material and convert it into honey.

The motion picture photographer of the United States Department of Agriculture followed the bees in their strange wanderings and visualized this particular scene. To obtain such a view, the photographer had to select a leaf in the woods where the light would be sufficient to record an image of the aphids. To cut the leaf would cause it to wilt and the honeydew honey could not be faithfully pictured. A microscopic view was made of the action of the American foulbrood, a disease so destructive to bee culture.

Patrick Henry's Speech Revised

"Caesar has his Brutus; Charles the First, his Cromwell and George the Third (cries of Treason!) may profit by their example. If this be treason, make the most of it!"

HOW often, in our boyhood, have we heard a schoolmate doing his best to fit the historian's description of the "voice of thunder and the face of a god," repeat the dramatic conclusion of Patrick Henry's impassioned speech on the infamous Stamp Act, even to the uplifted head and the flashing eye with which he unflinchingly and without hesitation answered the outburst by the Speaker of the Assembly, who had interrupted him, Henry delivered the defiant words.

Horatius may have been skulking under instead of braving the foe upon the bridge; Leander may have crossed the Hellespont in a put-putter instead of doing the swan act. Bill Tell may have eaten the apple instead of shooting it off his kid's head, Barbara Frietchie may have been shaking a rug and Paul Revere joy-riding in an automobile, but Patrick Henry's name was sacred.

The famous speech was recorded in his lifetime by Burke, who heard it, and repeated by William Wirt, who has always been considered an authority, and who took pains to have the version we have learned, approved by Judge Tyler, the elder, and Thomas Jefferson, both of whom heard the speech.

What better authority could there be, even if the speech was not published in any book prior to 1788, and Wirt's history first appeared in 1805?

But it's wrong, all wrong, for it has recently been discovered that P. Henry did not bid defiance to the British lion, but meekly insisted that he was a valiant subject of the king, and if anything he had said could be called treasonable, he must have been carried beyond his intent in the excitement of the debate, that if he had said anything he was sorry for he regretted it, and that he was willing to be forgiven.

Evidence of this version of the tame and impotent conclusion of the speech that made Pat Henry famous and has furnished more platform eloquence than any other, is given in an article in a recent issue of the *Advocate of Peace,* the official organ of the American Peace Society, whose 83 years of experience should have taught it that such a tale would result in controversy and bring on a war of words.

It seems that during the stressful times preceding the Revolution, France was quietly stirring up trouble between Mother England and her son Jonathan. One of her agents in this country "was a Catholic, perhaps an Irishman." He had a habit of keeping a diary, in which he recorded, in indifferent English, his daily experiences. The manuscript has recently been found in the archives of a French Historical Society. The author, who was present at the debate, thus describes the scene of the noted speech:

> "May the 30th.—Set out early from halfway house in the Chair and broke fast at York, arrived at williamsburg at 12 where I saw three Negroes hanging at the galous for haveing robed Mr. Waltho of 300 ps. went imediately to the assembly which was seting, where I was entertained with very strong Debates Concerning Dutys that the parlement wants to lay on the American Colonys, which they Call or Stile Stamp Dutys. Shortly after I Came in one of the members stood up and said he had read that in former times tarquin and Julus had their Brutue. Charles had his Cromwell, and he Did not Doubt but some good American would, stand up, in favour of his Country, but (says he) in a more moderate manner, and was going to Continue, when the Speaker of the house rose and Said, he, the last that stood up had spoke traison, and was sorey to see that not one of the members of the house was loyal Enough to stop him, before he had gone so far. upon which the same member stood up again (his name is henery) and said that if he had afronted the speaker, or the house, he was ready to ask pardon, and he would show his loyalty to his majesty King G the third, at the Expense of the last Drop of his blood, but what he had said must be atributed to the Interest of his Countrys Dying liberty which he had at heart, and the heat of passion might have lead him to have said something more than he intended, but, again, if said any thing wrong, he beged the speaker and the houses pardon. some other Members stood up and backed him, on which that afaire was droped."

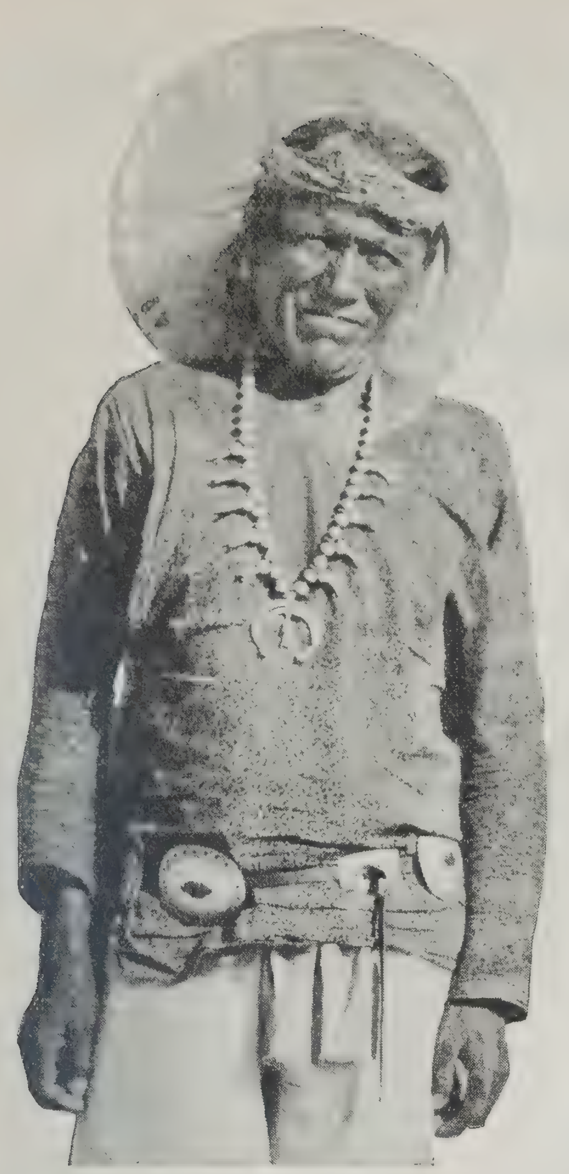
Other pages of the diary describe the debate on the resolution adopted by the Virginia assembly, which led to its dismissal by the governor the second day after Henry's speech.

It would hardly be just to the Wirt version to omit mention of its endorsement by Paul Carrington, a member who was present; nor to the truth if it were not said that Edmund Randolph, who died in 1813, left an unpublished manuscript "History of Virginia," in which he describes Henry's words as somewhat less inflammatory than the ringing challenge ascribed to him in accepted history.

Meteor's Scar on Desert of Arizona Now World Wonder

Imbeds Its Great Metallic Head Far Into Earth

By JOHN L. VON BLON



BROWN HAWK WING,

The Navajo who relates his people's graphic legend accounting for the world wonder in the Arizona desert.

BLAZING out of the empyrean fifty or a hundred times as fast as a bullet flies, a comet collided with the earth, showered an area of seventy-five square miles with many thousands of white-hot iron missiles after the manner of a huge shrapnel shell letting go, tore a stupendous hole in the solid rock surface, and imbedded its metallic head far beneath. That appalling planetary clash, which left in North Central Arizona a scar that is a world wonder today, occurred a dozen to thirty centuries ago. Now, after years of costly endeavor, the super meteorite has seemingly been found—in the enchanted desert mysteryland midway between the Grand Canyon and the Petrified Forest. Here appears to be the momentous climax to a cataclysmic drama of the comparatively recent past.

The obtruder from space is the celebrated Canyon Diablo Meteorite, named for the strange gorge near which it and its myriad of associated meteoric irons landed. It was long the subject of theorizing and controversy among savants—astronomers, physicists, chemists, mineralogists and geologists. Two or three of the latter contended that the yawning pit was formed by a steam explosion, probably due to volcanic heat, and that the fall of siderites in the same place and on the instant was merely coincidental. This hypothesis has been generally rejected as untenable, all the evidence being against it, whereas meteoric origin is established beyond reasonable doubt. There are no indications of volcanic action at any time. The phenomenon is variously known as Coon Butte, Crater Mountain, Meteorite Mountain and Meteor Crater. The last alone is appropriate. It is neither a butte nor a mountain but the remnant of a low hill that happened to be hit and hollowed out by a foreign object that had plunged millions or billions of miles.

This discovery, if it proves up, will rank with the most important of the times to science, opening a new and fascinating field of research as the sole marvel of its kind. Commercially—and that is the primary objective—it holds amazing possibilities, the iron, nickel, platinum, iridium and other elements giving promise of repaying manyfold the fortune expended on the singular task of locating this very tangible "celestial ghost." The work, prosecuted intermittently for twenty years, has entailed an outlay of fully half a million dollars, and is in reality but begun.

There are competent geologists and chemists who believe the stellar substance capable of yielding gems of unprecedented size, quality and value and thus being the richest single treasure ever uncovered. Like almost everything about it, this is conjectural and disputed by other authorities, but based upon the fact that all the Canyon Diablo irons contain microscopic diamonds, black, colorless and yellow. The wealth of the tomb of the Pharaoh Tutankhamen at Luxor may be excelled intrinsically, if not scientifically, by this find on the wind-lashed Colorado Plateau where rests a heavenly body in a colossal mundane grave of its own digging. Perhaps the latter interred itself about when the ancient Egyptian monarch was laid in his gold-lined sepulcher. They were brought to light simultaneously.

The mining enterprise is unique, the latest quest for the extra-terrestrial visitor having been carried on under marked difficulties for more than a year and a half with an oil drill. Fourteen hundred feet down the bit encountered something so much harder than tempered steel that the cutting process was reversed, the tool's edges were speedily ground away, and progress perforce ceased. Supposedly the prize has been reached. Pending the formulation of plans to handle the situation, which involves unusual problems and hazards, activity is suspended. Further, no information is given out at the scene of operations but it is understood an additional bore is to be made at once, a few hundred feet farther to the south. This will be good news to scholars around the globe whose thoughts have been centered on the spot since the absorbing explorations were undertaken.

There are serious questions to be considered. How extensive a proposition is it? How shall the material tapped be disposed of? What would be the most certain and economical method of getting at it? If a shaft be sunk to the metal and it is found to be a single solid body, will breaking it up be practicable? It is tougher than the firmest armor plate ever rolled. A high-power steel projectile has no more effect upon it than a pea blown through a tube. Treatment will not be an easy matter, if possible.

The United States Smelting, Refining and Mining Company of Boston, a great corporation with a dividend record of $40.000,000 to its credit, is responsible for the present development through a subsidiary, the Crater Mining Company, with C. W. Plumb on the ground as manager. It has a ninety-nine year lease on the property, which is owned by the Standard Iron Company of Philadelphia. The Standard is headed by Daniel Moreau Barringer, lawyer, miner, geologist and student, to whom is due credit for most of the early investigation and the learned presentation of authentic data regarding the natural marvel. His associates are mainly scientists.

The sunken meteorite is estimated to be at least 300 feet in diameter and to weigh 1,000.000 tons, and some experts who have studied the subject would double and even quadruple these figures. Its impact gouged a basin nearly four-fifths of a mile in diameter and 1.250 feet deep, which today has an average depth of 570 feet, a level bottom of about 300 acres, and a rim 120 to 160 feet above the surrounding plain, sloping outward from 500 to 1,500 yards. Over 300,000.000 tons of stone was broken and crushed and expelled by the inconceivable pressure, and half as much more violently disturbed and displaced. On the south side for half a mile all the strata were vertically lifted as a mass 105 feet above their original position, turned outward nearly on edge, and so remain. The logical assumption is that the mighty actuating instrument struck slightly obliquely from a northerly direction and lodged under the enormous shelf its bulk heaved up, hence the drilling at this point. Here the cliff is perpendicular and overhanging. On the the north is a gradual dip and a gap in the rim where the air rushed through after the meteorite. This corresponds in length with the south-wall uplift, beyond which lies the greatest amount of material, and the more comminuted, from the hollow.

Sharply angular fragments of all sizes, from limestone masses of 5,000 tons to sandstone reduced to an impalpable powder, constitute the material thrown out. The former are distributed principally in two "boulder fields" on the east and west slopes, the very large ones not to exceed a quarter mile beyond the rim while pieces weighing fifty to a few hundred pounds were hurled two miles.

Fine white "rock flour" on southern outer slope. Seventy-five million tons of this resulted from the terrific impact of the stellar body. The Navajos hold it sacred and employ it in all their religious ceremonials

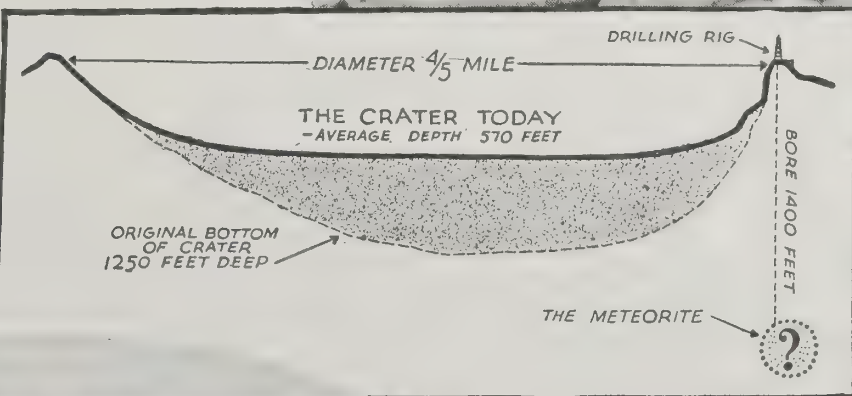


Diagram of the situation at Meteor Crater. (Drawn to scale.)

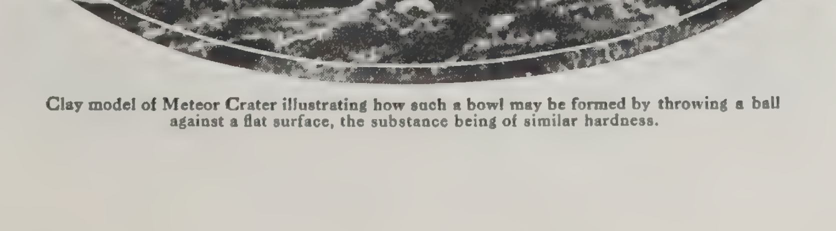
The snow-white "rock flour," so fine that it will flow through a 200-mesh screen, represents about 25 per cent, or 75,000,000 tons, of the ejectamenta, covers much of the outer slope and fills in large measure the lower portions of the bowl. Vast quantities were doubtless scattered by the severe winds of the exposed location at an altitude of 6,000 feet on the open waste. This comes from an 800-foot stratum of white or saccharoidal sandstone 350 feet below the surface and must have beclouded the sky for hours after the collision that pulverized even the tiniest grains



Clay model of Meteor Crater illustrating how such a bowl may be formed by throwing a ball against a flat surface, the substance being of similar hardness.

(Concluded on page 14)

Keeping College Athletics Safe for Amateurism

Professor Stagg, International Figure in the World of Sport, Leads in Fight to Have University Records Clean

By CLARENCE A. BUSH

PROFESSOR A. A. STAGG,

Veteran University of Chicago athletic director, hero of Yale baseball and football teams forty-five years ago, international power in amateur sports.

IN THE relentless, everlasting warfare to make college athletics safe for amateurism, there are a few directors who have kept their powder dry at all times. Under pressure of the bread-and-butter necessity of producing championship teams, when in the nature of things only one in half a dozen can win a given title, it is not denied that many college coaches have stretched this quality of amateurism.

One of the few men who have been undeviating in their stand for clean, non-professional records is Professor A. A. Stagg, veteran athletic director at University of Chicago. In all his thirty-one years in command of Maroon forces, not once has the whisper of suspicion been heard against this warrior.

It might be claimed that Professor Stagg has not been under the same pressure to produce winners, whatever the cost, that has weakened many another in a similar position.

As a matter of fact, there have been many campaigns to dislodge him after unsuccessful seasons in football and other sports, but the Old Man has been proof against all attack. His enemies have been forced to admit that season in and season out over a period of years, Stagg's teams have won their due ratio of championships, and this in the face of the fact that the Chicago undergraduate body is smaller by two-thirds than many of its "Big Ten" rivals.

Those who know the details of Professor Stagg's career are convinced of the fact that his unimpeachable record is owing, not to the security of his job in the face of alumni clamor, but to his absolute and unshakable conviction that the amateur principle is the only feasible one for college athletics.

When you come to think of it, why should colleges insist upon amateurism in athletics? Why should not a student, for instance, be allowed to earn his way through school by playing professional baseball?

Why, in fact, should not football stars, whose performances attract paying spectators by hundreds of thousands, receive some monetary reward for their services?

There is a great deal more loose thinking on this subject than you might imagine. Within the "Big Ten" territory every summer the argument is carried on pro and con in the newspapers. One paper even persuaded a majority of the directors of the conference to advocate, in interviews, the abrogation of the amateur rule in regard to summer baseball.

What does Professor Stagg have to say on the subject? He expressed himself very feelingly and convincingly in an interview with the writer.

It is not that the Old Man lacks understanding or sympathy for the struggling young athlete who is trying to work his way through school, for Stagg worked his own way through Yale University, and was a football and baseball star for five years.

Refused to Take Money

PROFESSOR STAGG recently confessed to a group of Chicago alumni that at times while at Yale he lived on twenty-five cents a day! He had to earn his own money. That was close to half a century ago when the cost of living was lower, but money was harder to get.

He might have earned big money playing professional baseball. Many of his team mates did during the summer. He could have made more than his companions, because his "gate" value as captain of the team and his skill as its star pitcher would have been worth that of any three others.

He refused to do it, because he felt it was not right, although the practice, so thoroughly denounced by all colleges nowadays, was permitted then and even encouraged.

"Illogical thinking and talking on this subject by newspapers and by men who ought to know better has done an immense amount of damage to amateur sports," declared Professor Stagg.

"General opinion has become so confused that the continued existence of intercollegiate competition in athletics was actually seriously threatened. The public could not understand why college ball players were not permitted to earn money playing for professional teams."

This attitude, Professor Stagg pointed out, resulted in the encouragement of many violations of the eligibility rules and the loss of some of the best players to conference colleges. It culminated in the Taylorville-Carlinville football scandal, participated in by an entire team of University of Illinois men including two or three varsity players hired on one side and about the same number from Notre Dame University hired on the other side.

"Conference officials awoke to the menace following these scandals," said Professor Stagg. "They saw that we were either to have professional athletics all the way through, or no intercollegiate athletics at all, unless drastic action were taken. It showed that we cannot wink at baseball playing for money without corrupting the entire athletic program, for football stars, basketball stars, swimming and track heroes will at once follow the example."

Selling the Amateur Idea

VITAL need for the education of college faculties, alumni, students, athletes and the general public on this subject is one of the chief causes of the appointment of a commissioner of athletics for the conference, Major J. L. Griffith, of the University of Illinois, with an appropriation of $10,000 for the first year to "sell the amateur idea."

"Colleges cannot have professional athletics because they are not engaged in purveying public amusements," continued Professor Stagg. "They are educational institutions, and all their activities are planned with this fact in mind. The reason for athletics in an educational institution is their educational, their physical and character-building value.

"Fair play, good feeling in the midst of strenuous rivalry, self-sacrifice, determination, perseverance, willingness of the player to give the best that is in him for the sake of the team, loyalty and devotion are some of the things developed by college athletics.

"What greater thing is there than to be masters of ourselves? If we were our complete masters, we should be supermen. Mastery in athletics is achieved in several ways. One is by control of temper.

"These things developed by athletics play a greater part by far in a boy's life after he leaves college than hereditary gifts, environment and opportunity.

"Loyalty and devotion—one amounts to nothing who can't tie to something worth while, whether it be duty, an institution, a religious belief, a team or a sport. Athletics bring out loyalty in the very strongest manner.

"It is a great thing to be able to give your best. Athletics teach how to do this. If boys and girls should learn to give the best that is in them to the practice of some athletic game we should have a finer citizenship—men and women of strength, devotion and loyalty."

Professor Stagg declared that there is absolutely no objection, moral or otherwise, to any man or boy selling his skill in any activity, whether at a trade or a sport.

"A professional athlete of any kind," he said, "is not barred from getting a college education with the money he earns in sport. All we say is that he cannot play on our teams with athletes who play for the fun of it, for the honor in it, for the education in it, because a group of professional athletes in schools creates unhealthy athletic conditions.

"When an athlete begins to take money for his skill, his whole attitude changes toward the sport. His dominating thought is, 'What is there in it for me?' The amateur's dominating motives are the joy of the game, the thrill of excelling, loyalty to the team and to the institution, and the desire for the good opinion of his group. The predominant thought of the professional is how much money he can get out of his sport."

Professor Stagg asserted that it was no accident that professional athletes did not respond quickly and freely to their country's call in the World War, as did the athletes in amateur sports.

Professionalism Kills Spontaneity

"THERE is a fundamental reason for it," he stated. "Amateur sport trains youth in loyalty to the highest degree. Its inspirations are fine and ennobling, unselfish and brave. Patriotism develops naturally and spontaneously in such soil. The instant a youth acquires the professional spirit, his services are no longer enthusiastic and spontaneous, co-operative and unselfish.

"This is the blight inherent in professional athletics. There is another aspect of most professional athletics which, while not inseparable, is usually to be found. This is the environment. Professional athletes usually have for their satellites, their hangers-on, the lower elements of society, including the loafers and gamblers.

"Now a professional can hold himself above this environment, and many no doubt do. But it is a tremendous handicap and all too many are not able to keep straight. Amateur athletics is clear of such environment. Its environment is of the highest order that our civilization affords. Our task is to keep it so."

Another point Professor Stagg made about the college boy who plays professionally was that the boy more often sells the college name rather than his services.

"Many college players, without their college reputations, would not be worth hiring for their skill alone. Their chief value is their drawing power as college players. Colleges cannot permit their names to be sold in this manner.

"Then, if certain college baseball players play all summer on professional teams, while their college mates work at some real job, preserving their amateur status, the amateurs will lose out in experience and skill so that professionals will win places over them on the team in every case. Then there would be nothing but professional teams."

Professor Stagg would carry the amateur idea even beyond the colleges. At his request the Order of the "C," composed of University of Chicago men who have won their athletic emblems from the first football team thirty-one years ago down to the present time, went on record at their annual meeting against any Chicago athlete playing professionally after leaving college.

You will find this sentiment growing among professionals themselves. They are coming to believe that a young man will do better, eventually, by starting in as an office boy at $10 a week than by going into professional athletics. He may do better in the latter field for a few years, but at the age of thirty-five he will have done better in business.

Uncle Sam's Piggery Aids 6,000,000 Farmers

Experiments Held, Employing Six Breeds, Including Razorback

By S. R. WINTERS

UNCLE SAM conducts a piggery—a hog farm, if you please! At Beltsville, Maryland, a dozen miles from the White House, where the United States Department of Agriculture maintains extensive acreage and facilities devoted to feeding and breeding experiments with dairy cattle, sheep and goats, approximately eighty-five acres have been reserved for swine investigations. Here, on this government reservation, methods of management and feeding practices are evolved that are calculated to make hog-raising more pleasant and profitable on the 6,000,000 farms—assuming that a major portion of the farmers in the United States grow a pig or two.

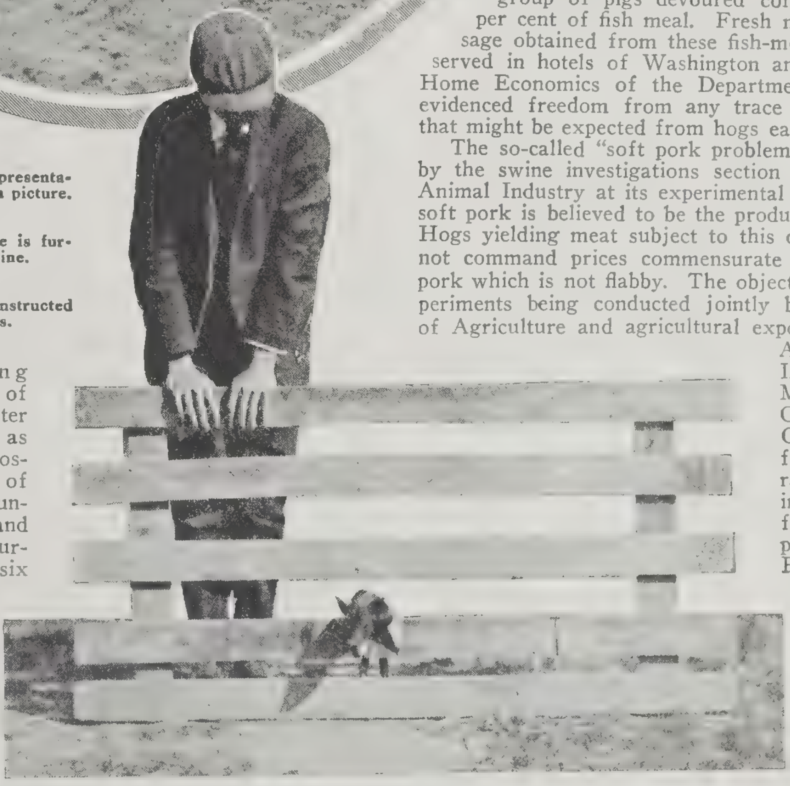
Uncle Sam, quite discreetly, is not a partisan to any breed or breeds of hogs. His piggery contains 468 head of swine, all told. Seventy-two Duroc-Jerseys, eighty-four Poland Chinas, eighty-six Chester Whites, fifty-five Hampshires, twenty-four Berkshires, and seventy-two Tamworths are the breeds recognized and the numerical strength of their respective representation. Crossbreds, two in number, thirty-five grade, and thirty-eight "piney woods rooters," complete the roster of the swine population on this eighty-five-acre government-owned piggery. While the swine investigations of the Bureau of Animal Industry, United States Department of Agriculture, is committed to the policy of advocating the propagation of purebred swine, represented by the half-dozen breeds just mentioned, the grades and "razorbacks" are maintained for specific objects in experimental breeding, the purpose of which will be disclosed before this article is concluded

That the hog is inherently filthy and thrives as well in a mud wallow subject to the scorching rays of solar heat is a theory that has gained considerable currency and acceptation by hog-raisers. The piggery conducted by the Department of Agriculture, by precept and example, should serve to explode this erroneous conclusion. Sanitary quarters, natural or artificial shade, clean drinking water, and individual houses that are well ventilated, lighted and heated, are the conditions governing the operation of Uncle Sam's hog farm. That such practices are conducive to the accumulation of flesh is being frequently demonstrated on this eighty-five-acre swine reservation at Beltsville, Maryland. A notable example is an experiment conducted with "piney woods rooters" or "razorbacks," to employ a more picturesque descriptive term. A number of mature sows, which had already farrowed two litters of pigs, were shipped from South Carolina to the experimental farm at Beltsville. Upon arrival, these nondescript swine averaged only sixty-eight pounds in weight. After remaining at the government piggery for twelve months, living under conditions to which other members of this hog family are subjected, the average weight of these "piney woods rooters" was 180 pounds.

If you inquire of Dr. S. Buckley, specialist in swine investigations for the United States Department of Agriculture, for the reasons of the thriftiness of these animals of uncertain breeding, he would tersely reply, "Feed and management." Elaboration of this answer serves to introduce the system of feeding in vogue on this eighty-five acres dedicated to the ultimate object of increasing a nation's pork supply. The 468 hogs maintained by the Federal Government eat their food according to the dictates of their appetites. In terms of city dwellers—if this phraseology is permissible—the cafeteria or self-help plan of eating is in operation. The swine specialist terms the trough from which hogs partake of feedstuffs in this style a "self-feeder." The feeds of a variable ration are constantly accessible to the swine and they do their own mixing of ingredients and eat to satisfying proportions. The boar or sow, admitting that the intelligence of swine is of small caliber, is capable of selecting both the kinds and quality of food best suited to thrifty growth. Man-selected rations may be discriminating, but the appetite of the hog, experience has determined, is the best barometer to its stomach and ultimate thriftiness in terms of "porkers."

The swine investigations of the Bureau of Animal Industry is pledged to a program of maintaining extensive forage crops, affording the hog population grazing opportunities for the greater portion of the year. There are three fields, each of which is five to eight acres in area; four woods' pastures of four or five acres each; nineteen one-quarter of an acre each in size, five one-half acre, and fourteen one-acre paddocks. In each field or paddock there is either natural or artificial shade, and automatic watering devices supply a constant flow of fresh water. The central farrowing house contains an office, feed mixing and feed weighing room, scales for weighing hogs, and a series of twelve pens—all of these units are found in the main farrowing house. Portable colony houses are employed as means of insuring comfortable quarters for the "piggies" when the paddocks and fields are their feeding and tramping grounds.

"It is an unfailing practice," to quote Dr. S. Buckley, swine specialist, "to turn over the soil and plant a crop at least twice a year, in order that the hog lots do not become contaminated with roundworms and other parasites which are frequently so destructive to swine. It is difficult to supply much pasturage in the one-quarter of an acre paddocks, but the one-acre lots are so planted that the system of management permits of grazing opportunities during most of the days of the year. Winter rye is seeded in as many lots as possible as a means of insuring an abundance of winter and early spring pasturage. Ordinarily six pecks of rye is seeded to the acre, but for the purpose of pasturage for hogs the quantity sown to the acre is approximately doubled. The result of the heavy sowing of rye seed is that the pigs are afforded a fine mat of succulent growth. Coarse forage is the inevitable result of thin seeding of rye, a condition that has proved unsatisfactory in raising swine Rape is grown extensively at Beltsville, and it is a forage crop of particular value to half-grown and mature hogs." Rape, however, has been found to possess poisonous properties, primarily affecting the skin of young pigs when permitted to eat thereof in the spring. Symptoms of infection from the poisonous properties of rape are found in slight or extensive sloughing of the skin and frequently the pigs suffer losses of tips of their ears In the larger fields, soy beans is a crop regularly planted because of the ideal pasturage that it affords.



Top—Pigs of the six representative breeds posing for a picture.

Circle—Artificial shade is furnished for the swine.

At right—A poorly constructed hurdle for pigs.

An abattoir—a scientific slaughterhouse for cattle, hogs and sheep—is located in close proximity to the central hog building. It is a well-equipped brick structure, which, including the facilities for slaughtering animals, entails an expenditure of $20,000. The capacity of this form of slaughterhouse is fifty hogs a day. Chilled rooms are ideally provided, making it possible to maintain the temperature as low as freezing point with only slight humidity. The abattoir is electrically operated, well lighted, sanitary and durable. All hogs subject to experimental study are killed in this abattoir. Feeding experiments are being continuously negotiated by Uncle Sam on his 85-acre hog farm. Notable among the tests to evolve valuable feeds for swine-growers is the discovery of the worth of fishery by-products. Shark meal, shrimp bran, red-snapper cannery waste, fish-glue-factory waste, sardine-cannery waste, and whale-meat meal, are the names of newly discovered feeds for swine as the results of experiments conducted by the United States Department of Agriculture. These meals, the products of waste accumulating around fish factories, possess protein contents varying from forty per cent in glue-factory meal to seventy-five per cent in whale meal. The flavor of meat obtained from hogs fattened on fishery by-products is unimpaired. Barley is not so efficient as corn meal for fattening hogs, is the conclusion of a series of tests conducted at Beltsville. Also feeding tests are in progress to determine the relative feeding value of heavy, stained, and light barleys.

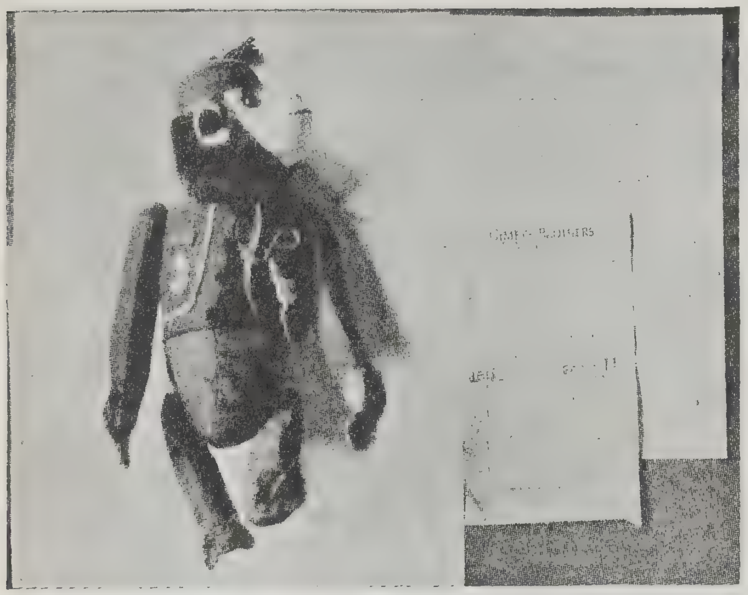
A feeding trial was also conducted in which fish meal and corn were hand-fed in contradistinction to the self-feeder style of administering feeds. This departure enabled the investigator to introduce large quantities of fish meal into the ration to determine whether or not this new feed exercised an undesirable influence upon the flavor and quality of the meat. One lot of pigs was fed corn meal with seven and one-half per cent of fish meal added; another group of pigs was permitted to partake of fifteen per cent of fish meal; still another lot of swine ate corn meal in a ration containing twenty-two and one-half per cent of fish meal; while a fourth group of pigs devoured corn meal and thirty per cent of fish meal. Fresh meat, loin, and sausage obtained from these fish-meal fed hogs, when served in hotels of Washington and by the office of Home Economics of the Department of Agriculture, evidenced freedom from any trace of flavor or odor that might be expected from hogs eating fishy products.

The so-called "soft pork problem" is being attacked by the swine investigations section of the Bureau of Animal Industry at its experimental farm. Essentially, soft pork is believed to be the product of certain feeds. Hogs yielding meat subject to this descriptive term do not command prices commensurate to those paid for pork which is not flabby. The object of a series of experiments being conducted jointly by the Department of Agriculture and agricultural experiment stations of Alabama, Georgia, Indiana, Kentucky, Mississippi, North Carolina and South Carolina is to assist farmers and hog-raisers in formulating a system of feeding that will not produce soft pork. Peanuts, peanut meal, soy beans and rice by-products are being fed to hogs to determine whether these products are conducive to the production of soft pork. Four hundred and sixteen head of swine were fed and slaughtered on Uncle Sam's hog farm during 1921, in study of this problem. External and internal parasites, as a foe to pork production, are being recognized by swine investigations, efforts being made to determine the period of life of the hog when parasitic injury is greatest. Other investigations take cognizance of the difference in value of purebred, crossbred, grade, and scrub swine. The results of this bit of research will have a direct bearing on the value of the purebred sire in hog growing.

Cutting and curing demonstrations are periodically held, and exhibits of meat produced under government supervision are taken afield, fairs in at least a dozen states witnessing demonstrations. At the national swine show both hogs and equipment are displayed.

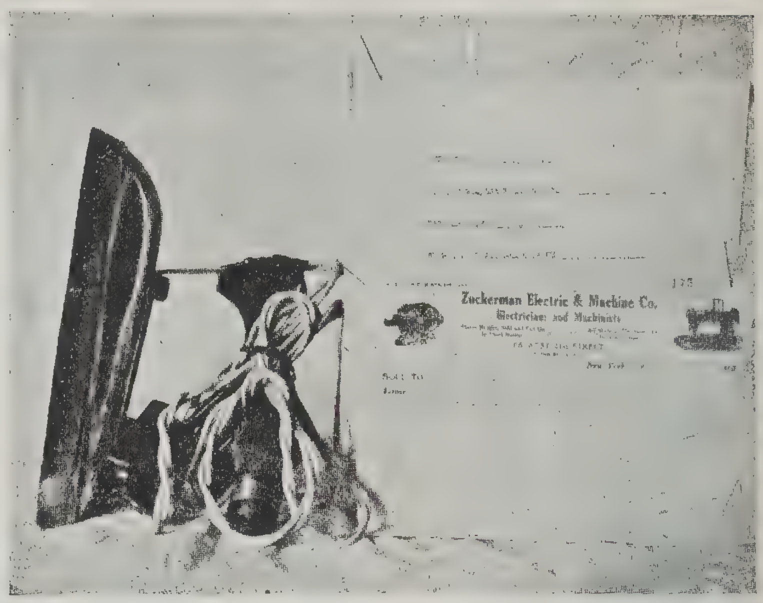
A Little Story on Retail Store Profits

Concluded from page 3



Left—The little toy monkey that you may have purchased for the baby suffered a mark-up of 553 per cent between the landed cost of $30\frac{6}{10}$ cents and the retail price of $2.00.

Right—A German manufacturer made this iron for 59 cents and after it was landed in this country, its cost, including all charges, duty, and so on, was $76\frac{7}{10}$ cents. It sold at retail for $5.50. The mark-up was 617 per cent.



like the foregoing, as the Treasury Department has done, but it will suffice to quote some of the really high figures of profit. Schwartz Brothers, 1454 Broadway, New York, got $68 for a small marble statue and bronze chair ornament from Germany, a mark-up of 753 per cent over the landed cost of $7.96. But Peter Korn and Sons, Fifth Avenue and Fourteenth street, New York, sold a German-made cuckoo clock for $22, whereas the government records show the landed cost of the article was only $1.26-7/10, the mark-up in this instance being 1,636 per cent. The same firm sold for $2 a carved wood clock that cost six cents in Germany, and only eight and one-tenth cents landed in this country, the percentage of increase being 2,370 per cent. At what was presumably a "mark-down sale" at Macy's, a marcel iron from Germany was sold for $1.39. Its landed cost was a little more than twelve cents, making the mark-up 1,012 per cent.

Gimbel Brothers, who also feature their mark-down sales, sold on June 6 a string of amber beads for $12.50. The landed cost of those beads was seventy-six cents—mark-up, 1,544 per cent. Stumpp and Walter Company, 30 Barclay street, sold for thirty-five cents a package cabbage seed from Denmark, the landed cost of which was a trifle over two cents—mark-up, 1,567 per cent. The Nev-A-Hone Razor Strop Company, of New York, turned up a neat 1,127 per cent mark-up on a pair of fifteen-cent shears from Germany, sold in this country for $2.65. The landed cost of a clinical thermometer sold by J. A. Hetherington, New York, jumped 575 per cent by the time it got to the American consumer; a rifle from Belgium sold by Davega Brothers went up 517 per cent, and a bird cage from Germany climbed 532 per cent by the time W. Stroffregn sold it. Parker and Battersby, at 146 West Forty-second street, for $5 sold a German razor that cost a trifle over thirty-four cents to land—mark-up, 1,349 per cent; and even that famous household remedy, cod liver oil, climbed 1,774 per cent after its trip from Norway. It cost less than seven cents a bottle to land and it retailed at $1.25.

The foregoing prices are typical of the whole list. The lowest mark-up shown of any of the imported merchandise described is 150 per cent. In the days of war prices retailers were defending mark-ups of fifty per cent, asserting that they are necessary for the conduct of profitable business. One hundred and fifty was considered to be profiteering, but what of a thousand and two thousand per cent mark-up? As the report points out, there is more to that situation than mere gouging of the public. The real danger is in the possible effect on American industries which must compete with the low landed prices. Since that time, of course, the new tariff has gone into effect, but judging by the warning issued at Washington that has not resulted in any material decrease of the percentage of mark-up.

Meteor's Scar on Desert of Arizona Now World Wonder

Concluded from page 11

It is silica, 99-2/3 per cent pure, and will become an important item as a by-product when developments in connection with the meteorite justify construction of a rail line to the crater. The top layer of the region is a purplish-gray sandstone 30-50 feet; below that 250-300 feet of yellowish-gray calcareous sandstone which has the appearance of limestone when eroded and weathered; then the white sandstone above described, and under it dark-red sandstone which was in nowise disturbed. (In the center of the crater.) All the others were, thus indicating the original depth of the hole. This geological arrangement is beautifully defined in the walls of the Grand Canyon, the Canyon of the Little Colorado, and Canyon Diablo.

Within a radius of six miles of the crater, and chiefly near by, have been picked up more meteoric irons than on all the rest of the earth's surface. In addition to the ordinary Canyon Diablo meteorites, recognized everywhere, the area has yielded many thousands of another variety, never found elsewhere, and known as "shale balls." These are generally rounded or globular, and sometimes pear or almond-shaped, disintegrating masses of meteoric iron and nickel oxide, often with solid nickel iron centers. The shell of iron oxide or shale is due to terrestrial oxidation and not to burning of these curious individuals in their passage through our atmosphere. The "balls" differ chemically from the common siderites in that they contain very small quantities of chlorine, absent in the latter. The largest weighed forty-odd pounds. They were recovered from the rock fragments and silica on the slopes, where they were protected from atmospheric action. Most of them have a tendency to disappear rapidly when exposed to the air. Their coloring is indescribably variegated and beautiful. Their number prompted the suggestion that the crater may not have been made by a single giant body but by a compact cluster or swarm of countless "shale balls" and possibly other irons traveling together as the head, or part of the head, of a comet. In that event the metal could be readily handled, once reached.

Fifteen to twenty tons of specimens, now seldom found and usually rated at one dollar a pound, have been taken away to museums in every land, and some of the more important institutions have splendid collections, but the best extant is in a little stone building perched on the bleak north rim, its roof secured against gales by steel-cable anchorage to rocks outside and heavy meteorites within. There are hundreds of irons and "shale balls," ranging in weight from a few grains to 1,800 pounds each. A few years ago the Meteor Crater Museum was struck by lightning and a thick layer of soft mud deposited on its floor and contents. There was no rain, the surroundings were tinder-dry. The source of the mud and how such a large quantity was instantaneously transferred to the interior of a well-built structure remain unexplained.

Twenty years ago, after Mr. Barringer, Benjamin Chew Tilghman and associates acquired the property through location under the mineral laws, their company did considerable exploratory work, both scientific and commercial, from the center of the crater to the far outer slopes, with shafts, drill holes, tunnels and open cuts, and hundreds of pieces of meteoric material were encountered. Some weighed as much as fifty pounds. On the outside of the rim all were thoroughly overlaid by and admixed with the rock fragments and silica from the interior. Here deep digging was not undertaken. In the crater, where twenty-eight bores were made, some to a depth exceeding 1,000 feet below the present bottom, meteoric matter was found in all, usually only from 180 to 650 feet. A few chunks were of sufficient size to put drills out of commission and be real obstructions. Shafts had to be abandoned 200 feet down because of water and quicksand—the wet "rock flour." On the original floor was once a lake, probably caused by cloudbursts following the terrific concussion, and afterward fed by occasional desert storms.

With the most modern of equipment and methods the Crater Mining Company has been overcoming obstacles and driving toward the hidden goal since May, 1921. L. F. S. Holland, of Los Angeles, consulting mining engineer of international experience, set the extraordinary venture under way and directed it a year. Both the outward evidence of something foreign beneath and a thorough magnetic survey pointed to the southeasterly rim as the most propitious spot and there the derrick was reared on the brink of the cliff. Expert drillers were brought from the Southern California oil fields. In the cavities of the split and jammed and upended strata of rock the tools were continually lost. Finally, at 350 feet, the drill turned at such an angle that it stuck crosswise and could not be withdrawn. Instead of blasting out a new site, moving the rig and drilling another hole, Mr. Holland decided to drive a six-by-eight-foot tunnel from the inner slope of the crater and rescue the tools. It succeeded and is in all likelihood a "fishing" job without parallel—making 360 feet of tunnel to get at a drill 350 feet down! A large saving of time and money was effected. Standard or cable tools and ten-inch casing were employed the first 700 feet and a rotary drill and eight-inch pipe the remaining 700 to the point of contact with what is believed to be the prize. From this the drill recoiled with a metallic ring like a tiny hammer from a blacksmith's anvil, and came up worn smooth. It is something that man-forged metal cannot match. All the way down to it the formation was found shattered, and meteoric material was present.

It has been calculated that the metallic body lies so far beyond the wall rim that possibly only its northern surface has been touched, and this may be the reason for the reported plan to drill at a point southward, which would aid in determining its size. If this is the "daddy" meteorite, and it corresponds with those heretofore found, it contains 90 to 91 per cent of iron (pure, not ore) of fine quality; eight per cent nickel, worth 30 cents per pound; one ounce of platinum, worth $110, to each five tons; a small percentage of iridium, even more valuable, and microscopic diamonds. Roughly speaking the content is worth $50 per ton. Should it weigh but one-thousandth of the 300,000,000 tons of rock it scattered, or 300 000 tons, its value would be $15,000 000. Were its weight 1,000,000 tons it would mean $50,000,000. It may represent hundreds of millions. The prospect is at once staggering and alluring.

Meteor Crater is six miles due south of the Atchison, Topeka and Santa Fe railway station of Sunshine, and eighteen miles southwest of Winslow, in Coconino County. The tall derrick on the elevated rim is visible twenty miles in any direction. On its transcontinental trains passing there by daylight the Santa Fe carries half a million passengers yearly. Those who see the solitary tower on the sandblown horizon smile or scowl as they visualize another wildcat oil well, the most ridiculous of all, little realizing that a romance of the universe may be in the writing.

The Navajos account for the crater with a graphic and significant legend that is partly borne out, or bears out, the white man's findings. Longer ago than can be reckoned, old Brown Hawk Wing told me in Winslow, three of his people's gods seeking endless repose rode down from the stars on roaring clouds of blue flame spreading farther than eye could see, alighted amid thunder that shook the mountains and threw the rock to the winds as dust and buried themselves in the plain. In the "heap big digum" slumbers the chief of these and must never be disturbed. "Bad luck sure killum" any who breaks his rest. As to the two lesser spirits' location the Indian was vague, "Out there," he said, pointing toward the lofty San Francisco peaks.

Brown Hawk Wing explained that the fire the gods brought destroyed every living thing in all that region except the dwellers in the cliffs and these went away, never returning. Archeologists are agreed that the Cliff Dwellers indubitably left their high-perched habitations precipitately and that whatever civilization flourished in the open places vanished simultaneously and at some time within a few thousand years.

This legend means something to the Navajos. They prove their faith by employing the "rock flour" from the crater in their ancestral tribal rituals, such as the sacred dance, which few white persons have witnessed.

The crater has a supernatural aspect that is enhanced by observation. It is profoundly impressive, awful, haunting, unbelievable, like an hallucination of the Painted Desert of which its setting is a continuation. To stand among the monumental boulders on the east rim, watch the Arizona sun sink in a flood of unpaintable colors, see the shadows creep along the titanic, torn, menacing rock walls, darkness close in upon the abyss, and then the moon rise and turn blackness to ghostly silver would make a lifetime picture on any man's memory. Bearing in mind that no other scene on earth can be attributed to like origin intensifies its vividness.

It is a long way around the crater on the rim—exactly three miles. To go in and out of the bowl is like steep mountain-climbing on rough zigzag trails. In winter the snow flies and in summer the interior is little less hot than Death Valley. The place is infested with rattlesnakes of the deadly little-horned variety, the sidewinder, a night prowler of vicious temper that can strike without coiling, simply arching his neck. Thousands of rats of a local kind live in the rock crevices and of these the drill sometimes brought up still quivering pieces. Golden eagles and ravens nest on the cliffs, which only wings can reach. Cottontails skitter over the bottom. Lynxes have been trapped in the derrick. A herd of 200 antelope comes within a few hundred yards of camp. Vegetation is sparse but on the south rim, within and without, grow stunted juniper and pinon trees up to 800 years old, and numerous porcupines destroy them by devouring the bark. By these can be reckoned the minimum age of the depression that suddenly succeeded a hill. The country is one of terrifying electrical disturbances which at times necessitate suspension of work. The meteoric irons are magnetic but their poles so crisscrossed that they affect the needle little unless broken up.

Government Moves Only When Driven

Economic Experts Are the Ones to Point the Way to Progress

By PAUL G. LEWIS

SO MUCH has been said and written about the great progress of the world that it becomes us to know not only the number or percentage, but also the character and class of men through whom progress is made possible. Likewise ought we to know the kind and character of progress made; and the manner in which such progress was effected.

A broad view of the foregoing ought to present enough information to direct us into proper avenues of search where may be found the solutions of our apparently difficult economic, political and social problems.

Those of the public who think that outside of war, humanity has been engaged in a smooth, easy-going, onward journey, know nothing of the extortionate and exceedingly painful price which the progress of humanity in every aspect has constantly demanded.

The progress of the civilized world, with few exceptions, has been one continuous struggle in every field of human activity—against progress.

It is only those who have endeavored to benefit the world by their contributions to the arts, sciences, economics or political government, who can fully appreciate and justify the truth that "The progress of the world has been built upon the sacrifices of human skulls."

Except perhaps in some of the arts and sciences where progress was prompted purely by a spirit of altruism, we find that in all fields of human activity the selfishness of man, expecting extraordinary rewards, has played an important rôle in the production of new knowledge.

An inventor, usually a poor man, harbors most wonderful dreams of great fortunes, thereby encouraging himself to endure the hardships incident to every life which is devoted to search for new knowledge for economic use.

The last hundred years has been the age of inventions.

Without inventions we would still be using horses or oxen, and depending on the wind to blow our ships.

We must certainly be grateful to those inventors whose knowledge has enriched the world; and equally grateful to those leaders of men who grasped the value of such knowledge and put it into practical operation and use for the comfort, pleasure and benefit of the rank and file of humanity.

But that we may not assume too much credit for this wonderful industrial progress, I am presenting a short table showing how few are entitled to any credit.

This table gives the number of applications for patents made during the years mentioned. The percentage of inventors to that population is given in the last column.

Year	Applications for Patients	Population in U. S.		Percentage
1846	1,272	(1850)	23,191,876	.00005
1856	4,960	(1860)	31,443,321	.0001
1866	15 209	(1870)	38,558,371	.0004
1876	21,425	(1880)	50,155,783	.0004
1886	35,968	(1890)	62,947,714	.0005
1896	43,982	(1900)	75,994 575	.0005
1906	56,482	(1910)	91,972,266	.0006
1916	71,033	(1916)	102,017,312	.0006
1917	70,373	(1917)	103,633,306	.0007

The producers in 1917 of new industrial knowledge (inventors)	.0007 or	.07 of 1%
An exceedingly high estimate (overestimate) of the percentage of industrial leaders (promoters) which roughly would mean 3 leaders for every 10,000 men, is	.0003 or	.03 of 1%
Geniuses and Leaders	.0010 or	.1 of 1%
Rank and File	.9990 or	99.9%
The nation	1.0000 or	100. %

The nation is led by the precious few who constitute the 1/10 of 1% but moved by the masses—the 99.9%.

In the rank and file, you need no high degree of education, if any at all, to be a passenger in a Pullman car, in an automobile, in a passenger elevator, or on a palatial ocean steamer. Your most essential qualification is "plenty money."

In the rank and file, you need no high degree of education, if any at all, to understand the proper use of a telephone. Your most essential qualification is the nickel. In the rank and file, you need no high degree of education, if any at all, to be a living fashion plate, bedecked with precious jewels, looking for that much coveted admiration (vanity, vanity). Simply "money" —that will do the trick.

However, think of that vast amount of knowledge it took via inventions to bring forth the steam engine, the automobile, the passenger elevator, the ocean steamer, the telephone, and the countless thousands of machinery; all of the foregoing used in supplying humanity with nothing more than food, shelter, clothing, sanitation, transportation and amusement—these, of course, furnished upon an exceedingly high level of service and efficiency.

Economically, we have arrived at what might be called a one per cent perfection or one per cent heaven, because we have acquired at least the fundamental knowledge of how millions can be safely housed, fed, sheltered, transported and amused while living in one city or solid community.

However, politically and socially, we have not moved one particle nor changed in the very least in principle since the adoption of the United States Constitution, although there is an exceedingly great consciousness that we are rapidly advancing toward troublous times.

A one per cent economic perfection and an almost one hundred per cent political and social imperfection are poor comrades; and so it behooves humanity to raise itself politically and socially through its geniuses and leaders to a level of at least one per cent perfection, from which elevation an evolution to higher levels will be more readily possible.

The term economics in its widest sense embraces every human activity relating in chief to the production, transportation and distribution of wealth.

As all commodities for use or consumption are merely the fruits of human labor, intellectual and physical, so may we judge aright the nature and character of that people whose economic standards we know.

Not a single nation has ever risen, politically or socially, morally or otherwise, above its economic environments.

The economics of a nation is the terra firma or solid foundation upon which human progress is primarily possible. Show me the country which uses the most primitive methods of economics, and you thereupon approach the lowest and most inferior type of man, not far removed from barbarism.

To the extent that economic activities in the past supplied the human necessaries, to that same extent were the arts and sciences developed, and to that same extent was man raised to higher levels of intelligence.

It was economics in practical operation which laid the foundation that led humanity out of the darkest ages of barbarism into civilization.

It was economics in practical operation which sustained the people of civilization in the past; and we will still have to look to that same kind of economics for a solution whereby to save the nations of the world from the impending dangers of tomorrow.

Contrary to the prevailing belief of many of the public, and contrary to the special belief of most political officials who think that all nations are constantly being led by their respective governments—it is nevertheless an absolute fact that in all times of national peace it was the master minds and these alone, toiling in the economic fields, who by their discoveries of new knowledge led the onward march of the world, whereas their respective governments only followed.

Governments never move forward until driven by the force of popular sentiment or the relentless pressure of necessity.

Every nation which today looks only to its government officials for a solution of economic, social, political and moral difficulties, is drifting into economic storms.

It is only in very recent years that the dominating power and influence of economics has been recognized as such by thinkers.

The fact that the world has missed the details of this most fundamental element of social progress accounts for much of the useless literature and harmful dogmas in textbooks treating on economics, especially in their relation to money and banking.

The great majority of these textbooks are not founded upon economic truths and facts; these books serve no other purpose than to mystify and confuse the minds of students.

Another great and fatal mistake is to look to our universities to furnish the wisdom which would retire our present old order, and usher in a new order of things which would establish the long looked and hoped for era of social justice.

At no time in the history of the world have institutions of learning ever held first place, or led the onward march of society. The fundamental purpose of the schools is to conserve all old and useful knowledge as well as receive that new knowledge which the master minds are bringing to light while toiling in the practical fields of human labor.

The schools at their very best can only hope to present apprentices to the world. However, beware of those apprentices who have political power, and who attempt to perform those works which require the services of masters.

The master minds in the economic activities of the world have been the only champions and leaders of the world's great progress during all ages of civilization—and we shall be compelled to look again to them to furnish the solution for those problems whose delayed solution is hindering normal progress now.

"Illinois Nominates—"

By a Bourbon Democrat

"ILLINOIS! Illinois! nominates for the next president of this great republic—" We will stop the quotation right here. Illinois is not now nominating anybody. Illinois is from Missouri. If shown, she may come to the next Democratic convention with bells on, maybe. Probably not. . . Here's why. In its best days the Illinois democracy was mostly Chicago. Occasionally the progressive wing of the party has controlled it but only when it dominated Cook County and carried with it the passive approval of the Chicago machine. It is an axiom of political science that city machines may champion good men and advanced measures when they are out of luck. Tammany has given New York some of the best mayors it ever had, *when it had to nominate a good man to win.* It's different in Chicago today. The democracy is in power. It elected a good man mayor, but it has an able boss.

When Chicago voters mopped up the remnants of the Thompson machine they also broke up a coalition of three other little Republican machines that sought to succeed it. The Thompson cohorts spent their last days in power striving to keep out of jail.

When Chicago voted the people had nothing national in mind, but they may have profoundly affected the proceedings of the next National Democratic Convention. The election raised to greater power a consummate boss of the old northern democratic school—modernized to fit the post-Volstead era, but in all essentials one who will be dominated by the traditions of his profession. The mantle of Roger Sullivan has proved none too ample for George Brennan. He went to San Francisco comparatively unknown, representing a defeated and discredited city organization. It is unnecessary to retell that he was the master mind that moistened the democratic platform and dynamited the Wilson-McAdoo organization. Murphy, Taggart and all of them ate out of his hand. It was not his fault that Candidate Cox later kicked over the playhouse and campaigned on the very issues that the Convention had impliedly repudiated. Barring a volcanic upsurge of the rural Democratic masses, George Brennan will name the next democratic delegation from Illinois and vote it as he pleases. It is not an extravagant prediction that he will have at his disposal the Tammany delegation, the boys from Baltimore and such like from all over this broad land.

The Democratic urban bosses have usually worked with the conservative Southern leaders in national conventions. Prior to 1896, when the South sent exceptionally able men to Congress and convention, this combination not seldom achieved statesmanlike results. The Southerners really dictated, the city bosses contenting themselves with strengthening their own positions, securing protection from state or federal interference and assuring themselves of federal patronage. Western agrarians, aided by similar newcomers in some of the southern states, broke up this combination in 1896, and reoriented the Democratic organization along its historical polarity. Despite its historical vagaries the Democracy has always been the popular party in this country. The chicken cock which old-time editors still run over the masthead after an electoral victory, is the same cock that crowed in the Roman forum and that symbolizes French democracy. Granted that the democracy once supported slavery, it is a fact that the opposition to negro slavery was an intellectual not a popular movement, it was an urge from above, a "campaign of education." Democracy's hold on the urban masses, its early attraction for immigrants and its friendly relations with religious bodies not in accord with the codfish traditions are all valid consequences of the popular character with which Jefferson endowed it and with which Jackson revived it.

Never was there a political organization composed of such incongruous elements. Destructive analysis of the Democratic party is a facile sport, also instructive, but it is easy to overlook the underlying unity and historic trend covered by the picturesque surface divisions.

Not that these divisions have been unimportant. I believe they have exercised a major influence on American history. In the face of the fact that the Democratic party has nearly always been the nominal political home of the majority of Americans, certainly of white Americans, the other party has ruled most of the time since secession.

It is perfectly true that the Democratic party is a hodgepodge, viewed from an airplane. In the South it numbers a great mass of non-voters, and a section of society that corresponds to the rural and urban native bourgeoisie that are the Republican backbone in the East. On the North Atlantic seaboard the Democratic party is Irish in leadership, Irish in brains and its votes come from the Irish and later arrivals who have proved plastic materials for Irish political genius.

In the West the Democratic party becomes increasingly "liberal," "radical," or whatever you want to call it, except when the Republican tent puts on such an attractive show that the Bourbons can temporarily take charge of the few Democrats who fail to flock into the big tent.

To attempt to catalog all the elements making up the Democracy, to trace each racial, historical, religious or economic tendency that has contributed to it, would require many volumes which no one would read. But under all of it there is unity and strength, which can be quickened into action by *leadership.*

There is a vast fund of common feeling and purpose resident in the elements of the party that will honor enormous drafts, when the right man appears with them.

The factional divisions and electoral disasters of the party are the result of its over-abundant vitality. The clashing life within it has defied discipline, brought defeat after defeat, but given it immortality.

It is as old as the government and older—it has the longest continuous history of any purely political organization on earth.

The regeneration of American political life will be accomplished by the man who captures its machinery and captivates the loyalty of its masses by giving bold expression to the inarticulate purposes of the American people so long thwarted by political leaders.

It is still the party of Andrew Jackson, and when some plain-talking, direct-acting leader comes along he'll find that it is still a Jacksonian party.

URBANA ILL

BRIEFLY TOLD

If the 150,000,000 acres now in farm wood lots in the United States were placed under sound forestry methods they would yield substantial revenues to their owners, as well as lumber to help relieve the timber shortage which has already begun to be felt.

There are twice as many motor cars and trucks in Hawaii than there are in all China.

The last type set by Warren G. Harding has been plated in gold and sent to Washington to be kept with other relics of the late President. He set the type in the composing room of the Fairbanks *News-Miner*. At that time he was presented with a gold make-up rule by printers of interior Alaska.

A drop of acid placed on one side of the body of a frog will cause the hind foot on that side to wipe it off. This would seem to indicate intelligent behavior, yet a frog in which the brain has been severed from the rest of the nervous system does the same thing.

The people living along the Yukon River in Yukon and Alaska bet when the great ice break will occur. They organize pools at Fairbanks and Dawson where large sums are won and lost at the betting. A pole four inches thick and twenty feet high is frozen in the ice in the middle of the river. A wire cable connects this pole with an electric stop clock on the shore, set to Standard Time. The second the ice moves the pole the clock stops, and that moment marks the record of the beginning of the ice break and decides all bets. The usual date is about May 10.

Both the gopher snake and the king snake of our southern states are inveterate enemies of the rattlesnake and are immune to his poison. The injection of the poison of a rattlesnake into the circulation of a cobra, in the Bronx Zoological Gardens, resulted in the cobra suffering no ill.

An actress who went to Paris seeking new plays for the Theater Guild of New York returned recently without any. She stated the plays she had seen in France were "so dirty" she would be unwilling to reproduce them in America.

"The United States must stop killing its Presidents," said Mrs. Douglas Robinson, sister of the late Theodore Roosevelt, in commenting on the death of President Harding. "No man who comes to the Presidency after the age of fifty can bear, without serious cost to his health, the enormous obligations put upon him by the American people.

Holding to the theory that good biscuits, or even fairly good biscuits, have a great deal to do with the success or failure of a marriage venture, the county clerk of Clarksburg, West Virginia, will issue a cook book for the bride along with each marriage license.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

When the root of the common cat-tail is macerated and boiled, a sirup of an excellent flavor is produced. This was commonly used by the Iroquois Indians on corn meal pudding and as a sweetening for other Indian dishes. Cat-tail roots are said to contain as high as thirty per cent of sugar and starch.

A trillion marks a day were printed by the money presses of Germany during the third week of July.

The "lamp" of the firefly consists of a substance termed luciferine, and the light is produced by the oxidation of this substance in the presence of an enzyme called luciferase. The oxygen is furnished by the air tubes with which the "lamp" is abundantly supplied, and is set free by a nerve impulse so that the light is under the control of the insect. The efficiency of the light of the firefly may be judged by comparing it with the efficiency of various other lights. That of a carbon incandescent lamp is 0.0042, of a tungsten bulb 0.013, of an open arc 0.072, of a quartz-mercury arc 0.068, and of the firefly 0.96. This light is the most perfect illumination known, the radiation consisting practically entirely of light rays, with only an infinitesimal production of heat rays.

A railroad to the summit of the sacred Japanese mountain, Fujiyama, is being planned.

One ounce of gold pays wages for twenty hours work in the United States, fifty hours work in Great Britain, ninety hours work in Japan, 100 hours work in France, 200 hours work in Germany. This means that Americans must maintain their past record for high output per man to guarantee prosperity which will mean work for all of us.

Six hundred Danish, Norwegian and Swedish farmers and their families arrived recently on the *Frederick VIII*, some possessing as much as $20,000 to $30,000. They declared that they were headed for the Middle West and Northwest to purchase farms. No mention was made of the hordes of Jews arriving at the same time who will in the near future exploit these 600 good citizens by holding down the prices of their farm produce and charging them exorbitant prices for their necessities which they will corner.

Golf is no longer an exclusive sport of the wealthy or well-to-do. There are eighty-five public links in the larger cities. On thirty of these links where more or less accurate records were kept there were played in one season something like 1,764,000 rounds. Probably 5,000,000 were played on the eighty-five municipal links.

All children born on immigrant ships at sea are admissible to the United States without recourse to law.

All bottles found along highways running through national forests of the West must be gathered up and buried or placed on the north or shady side of some mountain. Glass bottles absorb the sun's rays to a heated focus and start fires when conditions are just right, according to Federal forestry officials.

Amherst College will not graduate a man unable to swim 200 yards or more, according to report.

The Japanese bride on her wedding day receives eleven commandments from her mother. These commandments are rules of conduct which have been handed down from generation to generation, and all self-respecting brides are expected to live up to them.

The upper Mississippi bottoms are threatened by a drainage scheme. These bottoms are the most prolific spawning grounds for black bass and other game and food fishes, and to the Bureau of Fisheries they are invaluable for stocking lakes and streams. The bottoms are the natural feeding grounds for ducks, brant and geese, mink, muskrat, raccoon and many other kinds of wild creatures. The promoters have pledged $7,000,000 toward the project and will ask Congress to appropriate $14 000,000. Most of this drainage tract will produce farm land of little value even when drained, according to prominent experts of agriculture.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

9-8-23

Gold Standard the Vermiform Appendix of Our Present Financial System

By J. V. NASH

IN A RECENT monograph entitled "Money," by D. H. Robertson, M. A., Fellow and Lecturer of Trinity College, Cambridge University, England, there occurs the following striking passage:

"The value of a yellow metal, originally chosen as money because it tickled the fancy of savages, is clearly a chancy and irrelevant thing on which to base the value of our money and the stability of our industrial system."

This, be it noted, is not a shriek from a whiskered agitator on a soap box; it is the matured judgment of a profound scholar at England's ancient university, the nursery of a long line of illustrious writers and thinkers, from Milton to Tennyson.

To use an anatomical expression, we may well describe the gold standard as the vermiform appendix of our present monetary system. Now the vermiform appendix, we are told by scientists, once performed a useful function, but as man progressed from savagery to civilization it became useless. Not only does it now perform no useful function, but it is constantly in danger of becoming diseased when any severe strain is put upon it, causing chronic pains to its possessor, and sooner or later sweeping his whole system into the general ruin of death unless the useless organ is cut out in time by means of a surgical operation.

Centuries ago, before the science of anatomy had been developed, the cause of appendicitis was not understood; it was classed as a variety of "stomach-ache," for which the doctors prescribed all sorts of disagreeable medicines which only aggravated the trouble.

An Operation Needed

THUS it is with the gold standard in our financial system. We suffer chronically from panics, inflation and deflation, business cycles, "depression," and various other forms of industrial trouble, which are regarded by our economic doctors as nothing more than passing financial "stomach-aches," for the cure of which the patient is provided with pills and powders concocted by Wall Street and the Federal Reserve Board. But the patient, to the great alarm of the doctors and nurses, remains a very sick man. Well-informed economic specialists are at last beginning to perceive that it is a case of financial appendicitis, and that what is needed is not more pills and powders, but a skillful operation for the removal of a diseased and antiquated organ which the patient has long since outgrown.

An interesting clue to the origin of our monetary system is found in the derivation of words of a financial connotation. For instance, take the word *pecuniary*, a word in everyday use, the significance of which needs no explanation. It is derived from the Latin *pecus*, meaning *cattle*. The first bank was the prehistoric stock yards! The English word *chattel*, which is simply an older form of *cattle*, is still used technically to denote property or wealth of all kinds. Again, the word *fee* comes from the old Teutonic *vieh*, meaning *cattle*. The Stone Age lawyer collected his fees in oxen.

When the peoples of Europe were living in the pastoral stage of economic development, an ox was the recognized unit of value, a man's fortune being estimated in a "pecuniary" sense according to the size of his flocks and herds. Cattle were the bank notes and sheep the small change. Any other property he might possess was translatable into terms of oxen and sheep.

In those days there was no commerce, as we understand the term today, and no industry. Among the Greeks and Romans the family, not the individual, was the unit of society, each free family maintaining a numerous retinue of slaves, who were paid no wages. The lower class of slaves tilled the land and produced all the necessary articles of food. The slaves of ancient days, being recruited largely from among the prisoners of war, included many skilled artisans capable of manufacturing a great variety of articles of comfort and of luxury. Some of the slaves, indeed, were intellectually superior to their owners. Epictetus, for instance, one of the greatest philosophers of all time, was a bondman.

Slaves Often Used

SLAVES, being of smaller bulk and greater value than cattle, were often used as bank notes of larger denomination.

It was the gradual growth of trade among the countries of the ancient Mediterranean world that rendered necessary a medium of exchange of still smaller bulk and greater value, and the metals were introduced for this purpose. For a time thereafter, cattle, slaves, hides and metals were used interchangeably for currency. The following lines from Homer give us a realistic picture of a financial transaction in those far-off days:

> "From Lemnos isle a numerous fleet had come,
> freighted with wine.
> All the other Greeks hastened to purchase; some
> with brass;
> And some with gleaming iron, with hides, with
> cattle, and with slaves."

The first use of metals as money was for their productive value, as Homer shows in another passage, wherein, at the games in honor of Patroclus, Achilles lays down a mass of iron as the prize for whirling the quoit. In describing the value of the iron to the winner, he says:

> "Even if his lands be very far remote, it will last him five revolving seasons. For not through want of iron will his shepherd or his plowman go to the town, but it will supply him."

The leading metals are divided into two great classes—iron and copper being *metals of use*, while gold and silver are *metals of ornament*.

For many centuries the practical nations of the West, such as Greece and Rome, after having adopted a metal money, used copper and iron. It was on a *copper standard* that Rome rose to greatness and prosperity, copper constituting the only money of Rome until after the Punic wars.

It was in the effete Orient that gold and silver were first used as money. Iron and copper were rejected because they were metals of use, and in the Orient everything suggestive of labor or effort was despised. The metals of ornament—gold and silver—were prized because they were of no practical use, and the ownership of them was a hall mark of leisure, just like the uncut finger nails of the Chinese mandarin and the deformed feet of his wives.

In the course of time the indolent Orient succeeded in imposing the metals of ornament upon the monetary systems of the West, and ultimately gold supplanted silver, for no other earthly reason than that it was the most useless of all the metals and its ownership gave expression more completely to its owner's leisure and contempt for industry.

W. W. Carlile in a recent book on money remarks:

> "There is surely something surprising and paradoxical in the fact that substances such as gold and silver, which could have been so very well done without by the human race without any sensible diminution of their comfort or even of their luxury, and whose intrinsic value seems to depend upon feelings and desires that are to so great an extent merely fanciful and frivolous, should in the end have distanced all other commodities in the attainment of monetary status."

The true explanation of the adoption of gold and silver as monetary standards by the western nations is, however, readily discovered by a study of the conditions surrounding the rise of commerce in Europe. The trading class in the ancient Mediterranean world was composed of Orientals—Jews, Phoenicians, Arabians—and gold was the one article which these Orientals coveted most greedily and took most readily in exchange, because it was the commodity prized most highly in their Asiatic home lands.

The Stigma of "Trade"

A SOMEWHAT similar condition existed during the development of domestic commerce and industry in the nations of Europe. In the Middle Ages, when feudalism was supreme, trade was regarded as an unworthy occupation, in which a gentleman could not engage. Even today, among the aristocracy of England, there is a certain hypocritical stigma attached to the words "trade" and "tradesman" in social circles.

In the field of banking, the Jew was supreme. The lending of money at interest was forbidden by the Church as "usury," and no Christian could engage in it without incurring sin. The result was that both commerce and banking were dominated by the Jews.

Now, the Jew is not a European. He is an Asiatic, possessing the inherent characteristics which have always distinguished the peoples of the indolent Orient. This is said without the slightest intention of criticism, but simply as one might impartially analyze the characteristics of the ancient Egyptians.

It was the control of Europe's commerce and banking during many hundreds of years by the Jews which built up the European financial system on the gold basis. It is therefore not too much to say that the *Gold Standard is a peculiarly Jewish institution*, and it is noteworthy that the *Jewish international bankers are today the strongest supporters of the Gold Standard*. Through their long experience in the manipulation of gold they are able to maintain their grip upon the money markets of every country. The great money kings of the world today are the Rothschilds in Europe, the Sassoons in the Levant, the Schiffs in America, and their Gentile imitators everywhere.

The next step in the evolution of the Gold Standard, namely, the issuance of paper certificates giving the bearer title to gold, was also a Jewish invention. During the Middle Ages the Jewish control of money, and the exorbitant rates of interest which the Jewish money lenders often charged (which they justified on the ground of the heavy risks involved in the loans which they made to the kings and nobles for financing their wars) exposed them to the intense hatred of the people. The transportation of the actual gold from place to place, consequently, became highly hazardous. The messenger was likely to be waylaid, murdered, and robbed of his gold.

The Jewish bankers, therefore, adopted the plan of issuing drafts for gold, which were freely honored by their confreres in all the large cities of Europe. The drafts could be safely sent from place to place when the gold could not, as the robber barons and the roaming bandits, being illiterate, could not even read such paper even if it fell into their hands.

As recently as the seventeenth century, the goldsmith and the banker were often united in the same person. Gold coin and plate were constantly being melted down and transformed, one into the other. In India, until our own times, gold and silver ornaments were always readily convertible into gold and silver money. The value of the metal coins was precisely this, that they could be easily melted and made into articles of personal adornment—earrings, nose-rings, bracelets and armlets—or into plate. The possession of such articles conferred social prestige upon the owner. On the other hand, if the owner met with a reverse of fortune, these gold and silver ornaments could be quickly melted down and sold by weight in such quantities as might be necessary.

For many centuries the exchange of commodities and services by means of coins was merely an indirect barter, as the coins were desired for the actual metal in them, to be melted down and made into ornaments. *The modern financial system of using gold merely as a form of security, hidden away in vaults, with an immense quantity of paper money in circulation, only a small fraction of which could actually be converted into gold on demand, would have seemed to our ancestors a very bewildering and unexplainable arrangement.*

The quantity of metal in personal ornaments was often nicely adjusted for the purpose of serving as currency when needed. This was a general custom among the Hebrews, and explains the significance of passages in the Bible, such as "a golden earring of half a shekel weight, and two bracelets for her hands of ten shekels weight of gold," which Abraham's servant presented to Rebecca.

The Origin of "Pound"

THE shekel was originally a specified weight of gold. In the same way, the word *pound*, denoting the English monetary standard, meant originally a pound of silver, while a penny was a pennyworth of the same metal. "Shillings" were originally pieces cut from the gold armlets worn by the barbarian Anglo-Saxons.

Gold plate, similarly, played an important part in national finance. In England and France the king's gold plate was regarded as the most important part of the national resources. The wealth of the great nobles was largely estimated in terms of gold and silver plate. Lord Burleigh, of England, in his will distributed his plate among his heirs by weight, just as if it were so much gold coin or bullion.

Enough has been said to show that the use of gold and silver as monetary standards was closely associated with the state of culture (barbaric and oriental) in which social prestige was gauged by the quantity of gaudy ornaments worn on the person or the amount of gold plate which could be displayed at banquets.

The Western nations have, in actual practice, long since discarded this childish, barbaric and oriental conception of wealth. As the great Italian historian, Ferrero, clearly demonstrates, *"Gold is dead."* And it is likely to become a great deal deader, as the world becomes farther and farther removed from the childhood era of the race's progress.

Yet our foolish economists still hug the corpse to their bosom and cackle about the "gold standard" as the divinely ordained foundation of modern industrial wealth!

Today the display of gold on the person is considered a mark of vulgarity in civilized communities, and gold plate is seen only in museums. Gold has little if any value in industry; it could never be used in its pure state even in coins, its softness necessitating a rather heavy admixture with copper. The demand for gold coins is now so negligible that very few are minted. The useless metal is consequently stored away in the vaults of treasuries and banks; interred as in a tomb.

What Gold Standard Means

THE tragedy lies in the fact that we can have no more money than the law decrees may be issued upon the security of this buried gold. True, the amount of our money is many times in excess of the gold reserve. Let us suppose that a dealer in eggs had in his warehouse 100 cases of eggs and was permitted by law to sell the 100 cases of eggs to 1,500 different customers, RECEIVING FULL VALUE IN OTHER COMMODITIES IN EXCHANGE, on the theory that only a small fraction of the purchasers would demand delivery of their eggs! That is the theory of the GOLD STANDARD as established by law in the United States today, and that is how Wall Street reaps its enormous profits from the productive industry of the nation.

The consolidated balance sheet of all national banks, as of June 30, 1922, was published in the report of the Controller of the Currency recently issued. According to this balance sheet, *the national banks had "cash in vaults" to the amount of $326,181,000, yet reported "undivided profits, less expenses and taxes paid" of $492,000,000.*

Recent banking statistics likewise show that the financial "resources" of all banks (national, state and so forth) in 1921 amounted to $49,671,390,000. As the total stock of gold, both coin and bullion, in the United States in that year amounted to only $3,294,909,000, it is evident that *bank paper is outstanding to the tune of at least fifteen times the entire quantity of gold in the country*, and all of this is not in the banks!

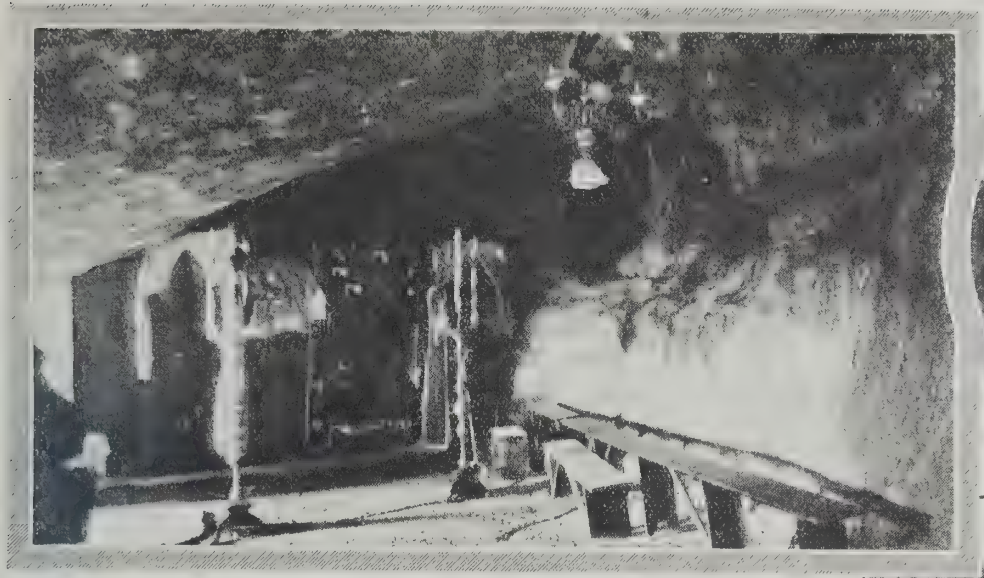
Such are the weird and wonderful workings of the gold standard, groaning under the top-heavy load of "credit" placed upon it by a false system of economics.

It was the paralyzing and demoralizing panic of 1907 that led to the creation of the so-called Federal Reserve System, which, however, has only tinkered with the disease of financial appendicitis by providing a means whereby a bank unable to satisfy the demands of its depositors in gold may call upon other banks for

(*Concluded on page 14*)

Patmos—Where the Apostle John Was Exiled

High in the Mountains of This Barren Isle Lies Monastery Built in 1088



Grotto in the Convent of the Apocalypse, a grotto where St. John is supposed to have written the Book of Revelation after he saw the vision in this cave. Shrine at the end of the cave is supposed to be the exact spot where he saw the first vision.

By

MRS. L. M. CRAMER

> *"I John, who also am your brother, and companion in tribulation, and in the kingdom and patience of Jesus Christ, was in the Isle that is called Patmos for the word of God, and for the testimony of Jesus Christ."*—The Revelation of St. John, the Divine.

IT WAS on the rocky and barren Isle called Patmos, its irregular shores lapped by the blue Aegean Sea, that the Apostle John was exiled. In a cave in the side of a mountain, according to the legend, he saw the visions which he wrote into the Book of Revelation. The verse quoted above—the first chapter of the Book of Revelation, ninth verse—bears out that legend.

Barren, rugged, but by no stretch of the imagination desirable or beautiful in Western eyes, is Patmos. It is an island of about fifteen square miles, and 3,000 souls, without a mile of regular road, without newspapers, telephones, railroads or telegraph connection, without a wheelbarrow or an automobile, and more than two hundred years behind the times, reaping its scanty grain today, in fact, as they did long centuries ago in the time when St. John's eyes were lifted to the visions he saw in the grotto whence came the wonderful and thrilling story, The Apocalypse.

But in one way the Isle called Patmos is far in advance of most American cities, for it has its municipal physician, a regular salaried man who is paid a retaining fee of nine pounds monthly by the fathers of the Monastery of St. John. In return for this retainer his services are at all times at the disposal of any who asks. The fact that those who can frequently add additional fees when the physician is called does not mean that the poorer ones are slighted. The doctor, a native of Patmos, is a graduate from the University of Athens and from a medical school of high repute in France.

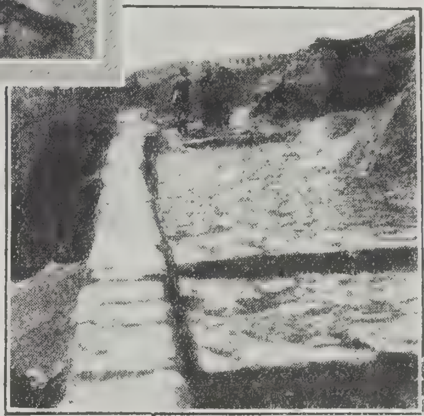
However, the municipal physician is the only modern institution on the island.

High up on the mountain, quite at its toplands, stands the Monastery of St. John, its whiteness dazzling in the brilliant sun, towering above the white buildings of the little village below. Within the monastery are thirty black-bearded, black-robed and high-hatted Greek fathers, the Monks of the Monastery of St. John, and it is their hospitality which makes the stranger welcome on the island.

These monks entertain the stranger in their land. No recompense is asked or accepted for the first three days of one's stay on the island. After that, if the guest stays on to explore the island, or to study in the library of the monastery, he pays the cost of the food he eats, and upon leaving he is privileged, if he likes, to leave some gift of money—a small sum in your eyes or mine, but much in the eyes of these simple-living, goodly folk. This privilege has become a custom which no one thinks of failing to observe.

The Monastery of St. John, 900 feet above sea level, was built in the year 1088. Long before that time the Holy Grotto, a natural cave in the side of the mountain and a full half-mile below the site of the monastery, was a mecca for God-fearing travelers who came to this out-of-the-way place, to tread the paths trod by St. John during his exile, and to stand for a time uncovered, with bowed head, in the cave wherein he saw the vision. This grotto is today a shrine in which the Monks of St. John hold daily service, and is known as the Convent of the Apocalypse.

Within the massive walls of the Monastery of St. John are nine churches, none larger than thirty feet square, for such is the custom of the Eastern church, where but one mass a day may be said at any altar. The treasury of each of these churches is rich in relics. In one, the staff of Christodoulos, in others scepters of bygone bishops, inlaid most exquisitely with pearls, and valuable copies of the gospels, richly bound, and priceless manuscripts. In one church is a pectoral cross, studded with precious jewels, overlaid with rich gold, presented by Catherine II of Russia, and containing, it is claimed, a portion of the original cross upon which Jesus was crucified.



Circle—Monastery of St. John and Patmos village, Island of Patmos.

Above—The trail from La Skala, the harbor town to the monastery, built 160 years ago.

Right—Convent of the Apocalypse, Island of Patmos.

These treasuries are all rich in relics; a skull of St. Thomas before which sea captains kneel, beseeching fair weather for the voyage upon which they are about to set out, or before which to give thanks after a stormy voyage safely weathered. In the monastery, it is claimed, there are bones of more than a hundred saints, and it is customary for some of the islanders to call these bones into service to help the island physician in times of epidemics, or when rain is needed if their scanty crops are to be saved. James, the brother of John, first of the apostolic band to meet martyrdom, is among the saints who are represented in the treasuries of these nine churches, as is also George, the patron saint of the Britisher.

It is the library of the Monastery of St. John which has, in the past, invited the scholar. An inscription on the door leading into the library reads:

"Here, O man, are lying many excellent manuscripts; more estimable are they to a wise man than gold; guard them therefore watchfully, more than thy life; for on their account is this monastery now become conspicuous."

But the glory of the library is passing, its greatest glory past. According to W. E. Geil, who has traveled the island well and more than once, and has published a book about the monastery, the care given the treasures of rare books and priceless manuscripts came too late to save many of the most valuable from earlier ravages by damp, moth and mice. Some of the most precious volumes were sold to foreign collectors. Of the 1,800 printed books in the library today, according to this authority, comparatively few are of any special interest except for their beautiful Byzantine bindings. Of the 600 old volumes and manuscripts, only about 240 remain, and often the beginnings and endings of these are lost, so that many authors are unknown. Among the most valuable of the manuscripts is a copy of the Gospels made about 600. It is on parchment, dyed purple, extremely fine and thin. The letters are stamped in some way with silver, which has blacked with age. The names of God and Christ are in gold, as are also the headlines.

One hundred years ago the monks built a trail—it can hardly be called a road—from the harbor of LaSkala to the monastery. It is built of stones, and so far as is known has never been repaired, but it is used today and is the nearest approach to a road on the island.

During the war Patmos was drained of its young men. Even before the war the lure of the western world, and that land of great opportunity, America, had taken many of its most worth-while, stalwart young men, and the result is that there is a great surplus of young women in the Isle called Patmos, and how to marry off their daughters is the great problem Patmos fathers are facing with faltering hearts. Two friends of mine who visited the island in the summer of 1920, and spent a month at the hoary old Monastery of St. John, got to know the people passing well, and one day a fairly prosperous Patmos man told them of the straits to which he was put to find a husband for his really pretty daughter. He was prepared, was this man, for a man in his station would be expected to give two horses to an accepted suitor for his daughter's hand, and he had the horses ready. He was prepared, but unfortunately the horses—he had had them several years—were growing old, and their appetites were enormous, and as money was scarce, and as the grain they ate was needed for consumption in his own family, the harassed father was almost beside himself, and frankly showed it.

The Island of Patmos is really three great masses of rock, joined by narrow strips of sand and pebbles some hundred yards wide. Naturally there is not much land that lends itself to cultivation, yet up on the sides of the mountains, as well as in the bays and glens, one finds little patches of garden or tiny fields of grain under cultivation. Orange, lemon, olive and fig trees will grow in these spots, but it takes several years for a tree to bear, and so, instead of setting out olive trees and waiting eight years for a crop, the people on the island are forced to plant grain and vegetables in the little patches of soil nestling in between the jutting rocks. The result is that they do not grow enough to support themselves, but, they point out, if they planted to fruit-bearing trees which would eventually give better returns, they would starve and die before the trees bore their first crop.

A very limited amount of wheat is grown on the island, not nearly enough to supply the people of Patmos, and the remainder is shipped in from Saskatchewan.

Before the war such a thing as a beggar was unknown on Patmos, but since the war there are some reduced to that extreme, a bitter experience for them, because of their native pride and independence, but even the beggars are clean on the Isle called Patmos. The native homes, clean as soap and water can make them, house

(Concluded on page 14)

A part of the present 30 monks now connected with the Monastery of St. John, on the Isle called Patmos.

Is It Coming?

THE chief virtue apparent in the Italian action against Greece is the virtue of promptitude. What Mussolini did he did quickly and with determination, which of itself is refreshing in this temporizing age. But as for the rest, there is grave question, especially as regards the ultimate consequences.

Striking parallels exist between the present difficulty and that which started the World War. It begins with assassination: Italian members of a frontier commission were killed in Greek territory. It continues with demands, which Greece (as once did Serbia) considers invasive of her sovereignty: presence of Italian representatives in the court of investigation of the crime; capital punishment of the criminals; an indemnity of 50,000,000 lire within five days, these three being the conditions whose rejection brought about bombardment by the Italian navy.

It was precisely on these lines that the World War began, Germany backing the severe Austrian demands, and Russia backing Serbia in her refusal to submit to the humiliation.

Another parallel exists: the peace courts of the world are scorned. In 1914 there was The Hague tribunal—utterly spurned by the would-be combatants. Today there is said to be a League of Nations which, if possible, seems at this writing to count less than did The Hague. There are two very dangerous overt situations in the world at present, the Ruhr occupation and the Italo-Greek crisis. Concerning these, the very sort of thing that the League is supposed to handle, it appears to be helpless.

Are we in the foothills of the next war? Are we already entering by the gate of lesser events those dangerous places in which the greater than national questions shall be put to the arbitrament of arms? Is it true that the last war has made the world sick of war? Such questions are answered by a glance at present-day Europe.

Courtesy would go far to prolong world safety at this time. It was the courteous place of Greece to offer satisfaction for the crime done against Italy. Thus having forestalled the natural resentment consequent upon haughty demands for reparation, Greece would have had the situation in her own hands. But courtesy does not exist in Europe today, nor any desire to do fairly with neighboring nations.

Borrowing Its Own Money

GOVERNMENT should not pay interest on its own obligations, for the simple reason that they are used as security for note issues, themselves an obligation. Financiers attack this position by saying that when the government needs money, it must borrow from some one who has it, hence should pay interest, just as individuals do. This attitude is based on the idea that money is property, a fallacy in itself, as economists, whether in favor of an ultimate commodity redemption or not, are agreed.

An incident which occurred three years ago is here offered to illustrate the undoubted truth that government does borrow its own money unnecessarily. Maturing obligations had caused the Treasury to offer for sale a quantity of certificates of indebtedness endowed with the circulation privilege. That is, they would be received on deposit as security for notes under the law a legal tender for all debts, public and private.

A visitor at the office of the Controller of the Currency sought information as to the process of issue of Federal Reserve Bank currency. He was taken to the office of the Federal Reserve Board, introduced to the official in charge, who courteously was giving him the desired information when called to the telephone. Excusing himself, he responded to the call. The visitor could hear his replies to the unheard inquiries from the other end of the line, an occasional "Yes, sir," "Certainly," and so forth, and a finally, "All right," followed by a repeat order which revealed the whole of the transaction. This repeat order was substantially as follows:

"You are Mr. M., of the Blank National Bank of New York. You desire to subscribe for one million dollars of the Treasury Certificates, to be deposited for the issue of a like sum in Federal Reserve Bank notes, and held pending arrival of your check for the amount, to be cancelled by the notes so issued?"

Presumptively the repeat order was correct, for the telephone conversation closed with "All right, sir, the order will be carried out."

Returning to the visitor, the official remarked: "You were seeking information and by a singular coincidence you have been given a practical illustration of the point, a better one than I could have given. Is that all?"

"Yes, sir; I am satisfied. But do you mean to say that the New York banker actually makes no investment at all, but subscribes for and receives a million dollar government obligation, bearing interest, and pays for it with money the government itself issues? Why not let the government issue the money on its own bond, and thus avoid paying interest, or, the same thing, pay no interest at all?"

The reply was a shrug of the shoulders and this caution: "I must insist, if you make any use of the information you have just received, that you do not quote me in the matter. Under this condition, I am willing to give you my private opinion that this juggling is only too common, and that the government could finance itself as well with a moderate issue of currency, as to delegate the power of issue to anybody."

There are men in Washington—as this indicates—who are just as intelligently aware of the fallacy of our present system as anyone can be, but they are caught in the net.

We leave it to any sensible man, banker or pedant, prince or peasant, if there is not proof positive that the government really borrows its own money from outsiders, paying them interest on it without return of a single benefit.

Sanctum and Countingroom

HOLLY LEAVES, a local weekly published in Hollywood, California, says it has been notified by the Southern California Telephone Company that no more company advertising will be placed with it because it headed some comment on the tardiness of service "The Company's Alibi." The editor simply says he cares for no business contingent on what he may or may not write and print.

The incident is illustrative of influences that surround the publication of newspapers. The feeling that the countingroom controls the sanctum is widespread and, sad to tell, is too often warranted, though there are notable exceptions. When a public utility having a monopoly indulges in a campaign of advertising that is not for the purpose of selling its goods but rather for the purpose of buying the support—or silence—of the publication in which it advertises, it is the first step in journalistic immorality and should be promptly rebuked.

New York Court Procedure

IT IS a trifling thing, in a way, but it is worth being made known in New York that something like this has occurred.

A man charged with murder and defended by a Jewish attorney was permitted to inspect the minutes of the grand jury which indicted him.

Another man charged with murder and defended by a Jewish attorney was permitted to inspect the minutes of the grand jury which indicted him.

A man charged with assault and defended by a Jewish attorney was permitted to inspect the minutes of the grand jury indicting him.

A man charged with "impairing the morals of minors" and defended by a Jewish attorney was permitted to inspect the minutes of the grand jury indicting him.

A man indicted for writing "poison pen" letters and defended by a Jewish attorney was permitted to inspect the minutes of the grand jury indicting him.

BUT, William H. Anderson, executive agent for 5,000 churches supporting the Anti-Saloon League, who is not represented by a Jewish attorney, was denied permission to inspect the minutes of the grand jury indicting him.

All this in the same term of court and by the same court.

Constitution Day

SUPER-PATRIOTS, endowed with a self-selected mission to lead their less assertive fellow-citizens in the path of true citizenship, are urging a special observance of the anniversary of the day the Constitution of the United States of America was completed for submission to the people of the Colonies which sought to form a union of States.

The idea is a good one. It is a duty every citizen owes himself and his country to study the framework of the Federal organization. The Constitution is the creature of the people. Among the conditions of agreement in the Constitutional Convention, the Jeffersonians forced its submission to popular vote. Yet by oversight the power of amendment was left to state legislatures, which might override popular will and have done so.

In conceding to Congress the power of money issue, a slight change in the language of the section left the question open as to whether Congress could issue money at all. The money combination strove to monopolize the issuing power, and the section which prohibits the establishment of a state legal tender was inserted. Judicial interpretation of the power of issue has remedied the omission of the words "to issue" which were written into the basic law.

Whether the omission was by vote of the delegates or deliberate deletion is not important, for it did not avail the Usurers of that day. They were compelled first to establish the power of Congress to issue money in order to give it power to delegate the right of issue to themselves. Hence judicial interpretation of the section has been uniformly in favor of the article as it was written in the first draft.

When, therefore, super-patriots deliver themselves of their rhetorical flights, the common citizen should be able to query them on these matters. No man is true to the Constitution of the fathers who justifies the continued disregard of the right of free speech, a free press, and peaceable assemblage. He is lacking in real devotion to the basic principles of this government who justifies search and seizure or arrest without due process of law. A free government cannot exist where interference with individual independence is possible.

These remarks are pertinent for Constitution Day. By all means let us observe Constitution Day, and let that observance be the more earnest because we understand the principles of that "palladium of our liberties" so remote from the present course of the Ship of State.

Are You Fifty Per Cent Honest?

IT IS impossible to say whether dishonesty is increasing or decreasing in the world. In America it seems to be increasing. That may indicate either that the moral tone is lower in all of us, or that American morality is being diluted by an influx of lower morality from outside. The increasing amount of dishonesty may not mean that the man we know is abandoning his principles; it may mean that the community is receiving a larger proportion of dishonest individuals than it ever had before.

This latter view is the more comfortable, and yet it would be difficult to maintain. No doubt the community record for honesty is greatly lowered by the influx of aliens of lower standards, but there is also a laxity apparent in our own generation. Where so many dishonest practices are apparent it is easier for men to create a gray neutral ground to take the place of the strict line between black and white.

The instances here given are taken from the eastern part of the country, a fact which should be borne in mind when drawing conclusions. In a famous eastern educational institution, the professor of psychology wished to make an experiment. He caused the 500-odd students patronizing the college cafeteria to be "short changed" five cents each at luncheon on a certain day. Of the 500-odd men only three failed to return and to demand their nickel.

On another day, several months later, he caused the 500-odd students to be "overchanged" five cents each. Out of the entire number only fifteen called attention to the error.

An eastern transportation company hires 8,000 men a year to keep 3,000 honest employes. Of the number hired, 5,000 are detected stealing money. The men would probably resent that way of stating their fault. They don't think of themselves as thieves. The gray neutral smudges their strict sense of black and white in morals.

Roger Babson says that when the nation is even fifty per cent honest, it gets along wonderfully well. It is something of a question—Are we fifty per cent honest? And what changes would the strictest honesty require?

Mr. Ford's Page

IN SOME of its aspects there is no uglier thing than unemployment. By this is meant the involuntary idleness of those who have the need to work and the will to work. In parts of the world this condition takes on the proportions of a national tragedy, as in England. In all parts of the world, statistics tell us, a certain amount of unemployment is a continuous and "normal" condition. The extremes of view with regard to it are represented on the one hand by the poor to whom the loss of a day is a loss indeed, and on the other hand by the selfish exploiter of labor to whom a multitude of idle men is a lever by which he can decrease the wages or increase the toil of those who are working.

Nothing would be simpler or easier than to dwell upon the individual aspect of this evil. It is not always, or even often, that actual physical suffering follows upon unemployment, but there is nearly always mental suffering, a sense of uncertainty and insecurity which is hard to bear. Many difficult situations can be borne if the end is foreseen, but as yet our whole economic system is so obscure to the majority of people that the end of distressful periods are seldom foreseen; the uncertainty remains from the very beginning to the very end.

UNEMPLOYMENT is an unnatural condition, even though statistics tell us that "normally" a large amount of idleness always exists. Putting aside the selfish causes of unemployment, such as a desire to keep "an anxious labor market," the principal cause is our ignorance how to use the surplus man power of the world. It is available but not utilized. That in itself convicts society of bad management. Curiously enough, the cure may come by the development of horse power. We use all the horse power we develop, and modern industry discovers that one horse power employs one man and thus supports one family. Mechanical power and human employment seem to go hand in hand—where you develop the one you must have the other. Let this be remembered when the question of employing all our people is considered.

It is all but useless to give the old-time advice for people to bestir themselves and when one means of livelihood gives out, to seek another. A certain resourceful portion will do that anyway. But the tendency in industrial communities has always been the opposite. Few people plan their lives, few look ahead to possible "rainy days," few extend their abilities beyond the one line of activity in which they happen to be placed. It is probably true that more people are chosen by their employment, than actually choose their employment. Besides this, in industrial communities there is nothing else to turn to, when unemployment comes, because everything in such communities depends upon the employment that has stopped.

Thus it would be easy to go on and emphasize many conditions incident to unemployment, whose human note is most harassing. And the more that one went on in this strain the more one would come upon things which are clearly wrong and stupid and self-destructive. For example: why should industrial communities exist at all in such a degree as to make themselves practical prisons for their inhabitants in slack times? Or, again, why should there ever be slack times with the world needing what industrial communities can provide, and the communities ready and willing to provide it? But these questions are part of a larger matter.

Natural unemployment could result from only three causes: first, an oversufficient supply of all commodities for all people; second, a voluntary rest period in the midst of production; third, physical inability to continue at work. The first cause has never occurred. It has been alleged time and again. The terms "oversupply" and "overproduction" often have been used to explain periods of industrial stoppage, but the actual condition of oversupply and overproduction has never been seen. There has sometimes been too large a supply of commodities for the people to buy, but never too much—never enough!—for all the people to use.

As to the second cause, we see it in operation every Sunday and holiday and vacation time; and the third cause has never been more than an individual condition, except when it has become a numerous individual condition during times of epidemic. So that even those whose business it is to explain unemployment will agree that unemployment in the world today is not natural.

Still, it is a fact, and every fact has its value. It is to the fact we must look, undiverted for the moment by individual considerations, to get its social meaning. For surely the fact of a degree of unemployment as a continuous and "normal" condition must have a meaning. It undoubtedly means, first of all, that the system under which we are living cannot absorb all the human energy that is now available. Living as we now live does not require the labor of all available workers to supply the world. There is a lot of power unused, and power unused is wasted, because the nature of power is to expend itself and not store itself. If the United States can go along as it is now going with approximately a million men continuously unemployed, as statistics show, it indicates that our present mode of living leaves a million power units unused, and unused in such a way as to indicate deterioration and permanent loss.

If it were a shop that could not use so large a percentage of its employes, could not find work for them, we should say that the business was badly run. To have one hundred men and use only eighty-five of them shows bad management somewhere. The shop figure is exactly fitting to the case, for though the thoughtless might say, "We could discharge the extra fifteen men," the fact is that Society cannot discharge them; they are here, part of the social organization, and as we view the matter in its wider social light we see that the unemployed constitute the extent to which society is guilty of mismanagement.

A further fact which thrusts up out of this condition is that the principal element in this mismanagement is not inherent in the situation at all, but is injected from the outside. These unemployed men are not employed because there is no money to pay them, and there is no money to pay them because those who buy goods have no money with which to buy. Money, the outside element, is the key to the matter, though money is not a necessity of life—we do not eat it, we do not wear it, we do not construct shelter out of it. There is plenty of food in the world, plenty of material for clothing, plenty of material for shelter, and these are the things for which we labor—yet though labor waits to exchange itself for these things, the exchange cannot be made between one real element and another real element except the artificial element of money comes in between. Of course, this is not all that can be said, but stated thus it is worth thinking about. There never is any lack of labor, any lack of material, any lack of need for both, and these being the essentials is it not surprising that society has not thought of methods by which they may always be joined together?

Another light upon this fact is the relation that nowadays exists between mechanical power and human power. Instead of mechanical power causing unemployment as was feared when it first superseded hand-labor, it has had the opposite effect. The steam loom employed more people than ever the hand looms did. Today the ratio between horse power and man power has reached one to one—for every horse power of mechanical power generated, one man is employed, which means that one family is supported. If there are a million men "normally" unemployed in the United States, it would be possible to employ them by creating an additional million horse power and using that power to supply the needs that are unsupplied by the power now used.

One water power in the United States is capable of employing one million men when it is developed. Power once developed will certainly be used. We have a knack of employing mechanical horse power even though we let man power go to waste. If this single water power in the United States were developed, the slack would be taken up.

Eventually there will be less employment in the strenuous sense. When we learn how to employ ourselves industrially we shall begin to know enough how to employ ourselves socially and so make good use of the spare time which industrial development will leave us for the cultivation of other interests.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

High Bucketeers at Bay When Indictments Come

"Bank Roll" Men Disclosed as Backers of Wall Street Stock Swindlers; "Ethics" Go by the Board in Frantic Scramble of Those Involved

By CHARLES ALBERT COLLMAN

NOTORIOUS confidence rogues, turf gamblers and former mining brokers, with riches derived from "fat money" made through years of sharp dealing, have now been disclosed as the hidden principals behind the Wall Street brokerage houses, whose spectacular bankruptcies have astounded the country, and caused losses of millions in cash and securities to flocks of credulous customers. The super-bucketeers, retiring from active operations in the Street, induced former clerks and inferior associates to open a long chain of bucket shops, from which the secret backers skimmed the cream of illegal profits. These "wirehouses" established branches in nearly all the large cities of the country, where active managers solicited the funds of investors and speculators. The millions that were harvested have slipped through the fingers and into the pockets of the wise sharpers, who laugh at the fools they duped. Such is the sordid story revealed by official inquiries into the conduct of a group of bankrupt stock concerns—the latest lesson taught by the operations of Wall Street's underworld.

The bucket shops were operated under assumed Christian names, to delude unthinking folk into the belief that they were dealing with their own countrymen. Through secret and intricate transactions, monies and accounts were manipulated among the various brokerage houses in the chain, so that prosecutors, referees and judges, trying to unwind the tangle of involved operations, are having difficulty in placing the responsibility on the real instigators of these frauds. It is quite plain that such tactics were adopted by the bucketeers under the advice of criminal lawyers. Apparently even the lawyers became corrupted in the machinations of their clients, dazzled by the huge fees, the wild lives and riotous entertainments of the high bucketeers.

Not a Cent for Victims

WHILE the creditors of the bucket shop men are not likely to get back one cent on the dollar, the arch rogues have evidently hundreds of thousands at their disposal for defense. There have been prosecutions by the district attorney for New York County, the United States District Attorney, indictments by grand juries, *and prison sentences as yet unserved.* In court trials it is charged that jurors have been bribed; referees, trying to learn what has become of assets of firms, have been defied; witnesses have been kidnaped, incriminating papers destroyed. Federal authorities found it necessary to remove two brokers, who had been imprisoned in Ludlow street jail, to cells on Governor's Island, with the consent of the War Department, because the men were found to have been enjoying luxuries in prison, and nights of freedom in roaming about the city. These two accused brokers then "confessed," incriminating their own lawyers. The lawyers, in turn indicted, now have "exposed" their own clients.

This particular chain of bucket shops that is under investigation by both county and Federal authorities defrauded some 20,000 to 30,000 creditors, to the amount of from $15,000,000 to $20,000,000. According to the attorneys representing these unfortunate people, they stand little chance of getting any of their money back. It matters little how many rogues are convicted and sent to prison, it will do the creditors no good.

Among those who have been questioned closely by referees and prosecutors, to learn what relations existed between them and the bankrupt brokers, is Charles A. Stoneham, former dealer in mining stocks in Wall Street, and now president of the National Exhibition Company, and part owner of the New York Giants baseball club; also one Arnold Rothstein, a notorious New York gambler, now stated to be an insurance agent, who was involved in the White Sox world series baseball scandal, and others less widely known. Rothstein refers to himself as "the smartest man in the world." Another one whom the authorities wish to question is "Dandy" Phil Kastel, financial backer of one of the failed concerns, who, since his indictment for grand larceny, has been a fugitive from justice. Still others needed for interrogation are "Nicky" Arnstein, and other former members of the Gondorf gang of wiretappers, mostly ex-convicts, and habitués of Longacre Square, some of whom were involved in the corruption of Yiddish messenger boys, in the great organized thefts of stocks and other securities from the Wall Street financial district during the years 1920-1921.

Mr. Fuller—Ginsberg!

THE present investigations center about the defaulted brokerage houses of E. M. Fuller & Company, Dier & Company, Dillon & Company, E. H. Clarke & Company and other links in the chain of firms. E. M. Fuller & Company failed for $6,000,000, Dier & Company for $5,000,000 and the others for additional millions. The head of the first-named firm, the man who calls himself "E. M. Fuller," really bears the name of Ginsberg. Naturally, had this widely advertised wirehouse been conducted under his actual patronymic as "Ginsberg & Company," there would have been small chance of his ever having accumulated the enormous sum of $6,000,000 in the coffers of the firm from credulous investors.

The origin of the chain of fraudulent brokerage concerns has been revealed as follows: When the firm of Charles A. Stoneham & Company went out of business in 1921, its accounts were transferred to the group of firms including E. M. Fuller & Company, Dier & Company, the Dillon, Clarke and other alleged stock brokers. On exactly how this arrangement was carried out hangs the crux of the present situation. Several creditors have entered suits against Stoneham, owner of the New York National League Baseball Club, alleging they were defrauded in this transfer. In their affidavits they state that they received circulars from the Stoneham Company, notifying them that it had become expedient for Mr. Stoneham to retire from the brokerage business because of his numerous outside interests, and that other firms, such as the Fuller, Dier and Dillon concerns would take over the business. These firms, the circular said, had been investigated by Stoneham, and found to be financially responsible. The plaintiffs say that because of these representations made to them as to the financial status and experience of the new houses, they consented to the transfer of their accounts, only to learn later that the Stoneham Company had sold out part of their holdings without notice that their margins were exhausted, or calling for more money. Later the chain of new firms toppled into bankruptcy, with their assets vanished.

Jail Is Efficacious

IT WAS now found difficult if not impossible for the referees in bankruptcy to obtain the books and records of the chain houses. Ginsberg, or, as he now calls himself, "E. M. Fuller," and his partner, William F. McGee, once charged with wire-tapping, were directed by Federal Judge Henry W. Goddard, to return to the Federal trustee certain important papers which had disappeared from their records. The brokers would not return them, and refused to tell what had become of them. They were sentenced to indefinite terms in Ludlow street jail for contempt. Later, some of the documents were mysteriously returned to Judge Goddard by messenger, but the judge refused to purge the men of their contempt. Finally, during their sentence in jail, Ginsberg and McGee decided to "squeal." They pleaded guilty to the charge of bucketing stock orders, and were sentenced to a term of years in Sing Sing prison. Their pleas of guilty came as a surprise, because, during three trials, they had fought stubbornly for freedom. The trials were marked by alleged kidnaping of witnesses, the disappearance of the incriminating papers and an alleged attempt to bribe one of the jurors with $1,000.

Meanwhile a referee in bankruptcy called as witness Mr. Stoneham, owner of the Giants, and asked him to explain an item on the books of E. M. Fuller & Company, showing that he was credited with having paid the sum of $147,500 to "capital account" in the brokerage house. Stoneham made the surprising explanation that he had loaned that sum to "Tom" Foley, a Tammany politician, who had borrowed it from him for the purpose of helping out Fuller & Company. The money, he asserted, was loaned without security or note.

Foley, when questioned, in turn explained that he had once tried to help McGee, Fuller's partner, when McGee was charged with wire-tapping, and that McGee's wife had sought his aid on behalf of her husband when troubles began to overtake Fuller & Company. Stoneham, he explained, had lent him the $147,500 without security and he had turned it over to the brokers, to whom he had also loaned an additional $15,000 of his own money without security. These generous gifts of large sums to failing brokers were described by the witnesses in an offhand way as acts of good fellows, to help out their friends.

Rothstein—"Smartest Man"

ARNOLD ROTHSTEIN, the gambler, next called as a witness, was questioned concerning a trading account he had with Fuller & Company, from whom it was alleged he had received checks amounting to $187,600. He was also asked about reports that $385,000 had been lost to him by either Fuller (Ginsberg), or McGee to Rothstein at the race tracks. Rothstein was thoroughly grilled by attorneys for the trustees and the creditors, who attempted to get from him the details of gambling transactions with Fuller and McGee. But the smartest man in the world lived up to his reputation for sidestepping and evasions, and his examination had to be deferred until he could be confronted later with documentary evidence.

Ginsberg (Fuller) and McGee, deterred from the trip to Sing Sing by their Ludlow street jail sentences for contempt, and enjoying surreptitious privileges, were suddenly whisked away to cells at Fort Jay, Governor's Island. This environment soon brought the two bankrupt brokers into a state of mind where they resolved upon making "confessions" regarding the disposal of the missing documents, which, containing evidence of bucketed stock orders, had caused them to be imprisoned for contempt. The two men had been represented by a firm of criminal lawyers, Fallon & McGee. The clients now swore that their lawyers had connived at the destruction of the documentary evidence. William F. McGee, one of the bankrupts, made affidavit to the fact that he had torn up and destroyed some of the papers, and that on the same day, part of the books, papers and records had been done away with by William J. Fallon, with the full knowledge of his law partner, Eugene F. McGee. Ginsberg's affidavit was to the same effect.

Fallon and McGee were promptly indicted. When they appeared in court, these two eminent jurists gave an exhibition of their professional ethics by promptly "squealing" on their former clients. Fallon, who had once enjoyed a reputation in criminal courts for his loud-voiced oratorical displays, shouted: "We want twelve men to determine whether or not these men who admit they stole millions of dollars are telling the truth. We want to have a jury to see if Fallon and Eugene F. McGee had any motive to destroy these papers which were without value. Fallon and McGee never stole a penny of anybody's money. Fuller and McGee have committed 200,000 separate felonies. We have a right to find out what price they are getting for this. See what a monstrous proposition we are up against. Those men were in jail. Now they are living luxuriously at an uptown hotel after defrauding the government of millions of dollars. They have been given their liberty. For what? For saying that Fallon and McGee destroyed those papers," and so forth.

However edifying or entertaining may be the spectacle of rogues and their lawyers falling out and denouncing one another, the lesson taught from the operations of the high bucketeers lies not there. The men and women in Tennessee, Georgia, California, Wisconsin and other states, who had handed their money and securities over to the managers for the bucket shop chains, in the hope of making more money, and on whose affidavits the proceedings already described were taken against the brokers who defrauded them, can obtain little satisfaction from the court stories. It is very doubtful even if the arch rogues ever will be brought to book.

$75,000,000 Estimated Loot

WALL STREET stock swindlers operate apparently on a theory that there exists a class of persons created solely to be "trimmed," and anyone observing the ease with which this proceeding is accomplished will be inclined to believe that this theory is right. Without the existence of credulous folk who, closing their ears to warnings and admonitions, intrust their property blindly to the first-comer, such gigantic swindles by unprincipled men would become impossible.

In speaking with the counsel representing various groups of creditors, I found that they frankly admit that they do not see how their clients can benefit from the revelations of the imprisoned brokers. "Even suppose," said one of these lawyers to me, "that some of the brokers can prove the existence of four or five wealthy silent partners, it will take a long time to make such men disgorge. No silent partners are going to give up unless they are made to do so, appeals after appeals will have to be taken, while the expenses of the creditors will be mounting up all the time.

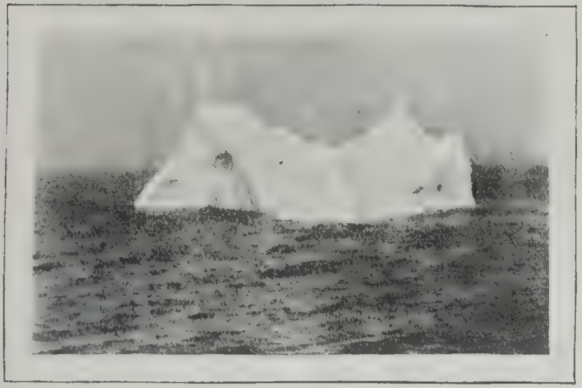
"Let us take it for granted that the silent partners admit they are partly responsible for the liabilities. Suppose they turn back one million dollars to the creditors' fund. In the case of Fuller & Company, Dier & Company, Dillon & Company and their kindred firms, that would mean only a few cents on the dollar. But that million would first have to be split up in attorneys' fees, court proceedings, expenses for referees and the administration of the bankrupt estates. Frankly, if I were a creditor, I would feel like charging off my losses and accepting my lesson."

It is estimated by the District Attorney's office in New York that since the war at least $75,000,000 has been obtained from the public by Wall Street bucket shops. The greater part of this money went directly into the hands of men who considered it legitimate plunder, to be spent on their own necessities or amusements. In one instance, a man named Kardos, of the firm of Kardos & Burke, is found to have sent a large sum of money abroad, with directions to buy himself a "castle in Hungary," shortly before his failure. Kardos & Burke left liabilities of more than $3,000,000, owed to about 4,000 customers. Three-fourths of these persons live in scattered sections of the country, many of them residing in the Far West.

'Ware of 'Phone Brokers

IT IS a wise rule never to consider or reply to the plausible circulars or ingenious prospectuses sent out by mining brokers, oil promoters and "stock specialists." The alleged broker whose salesmen ring up their "prospects" on the telephone, is in nine cases out of ten merely a distributor of worthless certificates. The greater part of the money thoughtlessly flung away by indiscriminating investors or speculators, could easily be diverted into productive and profitable channels, if they would make it their rule to invest on the advice of their local bankers, or place their funds in home industries, managed by men of responsibility in their respective communities. Country banks are steadily increasing their facilities to protect the investment surpluses of inexperienced investors, and the more general employment of such facilities will make the trade of the bucketeer unprofitable. The average small investor has, although he may not know it, at his own town or village bank every feature of the most accurate financial service that the greatest financial institutions of the country can prepare. In Wall Street, money is dealt in, but it is not made there. Distance may lend enchantment to the view, but the pot of gold is never found at the foot of the rainbow.

From Bridge to Boilers of a Liner



The Interesting Account of a Trip From Halifax Across the Atlantic

By A. R. PINCI

NOT having as yet attained the freedom of any city, I have been fortunate enough to be endowed, for the duration of a voyage across the Atlantic Ocean, with the freedom of a huge steamship. There are many things connected with a big ocean liner that the average passenger knows little or nothing about. The unfortunate ones who look at the ocean face downward don't think about it, but all the others think of their three master meals and two "teas"—morning beef and afternoon pekoe—as the best part of their days on board.

As though for my especial benefit, Mother Nature staged a marvelous scene along the Gulf of St. Lawrence, with scores of icebergs, big and little, from million-ton ones to almost invisible "growlers," beneath a sunshine that the navigating officers considered as somewhat rare but which they welcomed with all their hearts. And then, lo! Impenetrable fog just as we were about to emerge from the berg zone, which descended upon us unexpectedly and caused a delay of sixty-five minutes.

The New York skyline from outgoing or incoming steamships is very beautiful, in its way, especially under favorable weather conditions, but its contour is now about stationary. The voyager who has seen it a few times no longer pays any attention to it, unless he feels—quite often—the itch of explaining the various units to a companion who sees it for the first time. But apart from this, custom breeds indifference. That is why I tried the St. Lawrence route.

May I commend it to all those Americans who, having been to Europe by way of New York, expect to go there again? It is not intended, this, as an advertisement for the company operating the ships, but largely instead as an advertisement of North America. As a continent it cannot suffer from too great publicity, and this observation is made by the writer in his quality of native European.

See the United States first; see Canada next; see the rest of the world afterward. The St. Lawrence route I commend, at least for a trial, both as an education in seamanship for poor sailors and scenically for all the others. Also it conveys better than words the extent of their country. Traveling companions of mine coming from Southern Arizona and California were on fast trains five days merely to reach the ship's side, and then two more days of land constantly in sight ere Labrador and Newfoundland coasts were lost to sight.

The ocean voyage is reduced by two days, because for fifty hours or thereabouts one sails hundreds of miles on the beautiful scenic inland waters of the St. Lawrence River and Gulf. This part of the trip is a sort of kindergarten for poor sailors.

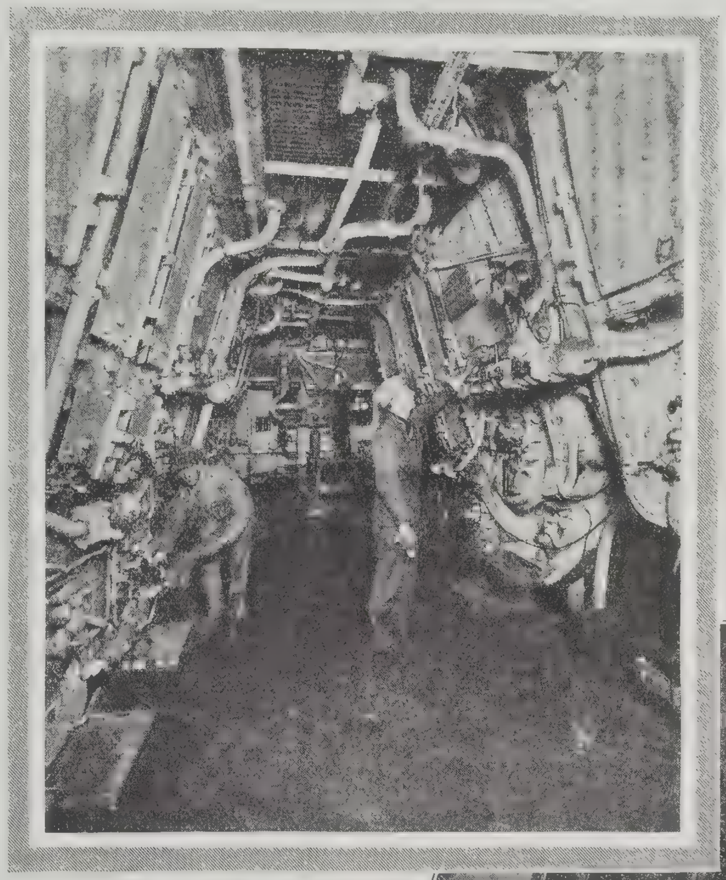
One may start on the smaller ships from Montreal, starting in the morning and quietly winding one's way through the smooth deepwater channel, at times within calling distance of cattle grazing on the shore, on through Lake St. Peter, forty miles long, and late the same afternoon passing under the Quebec Bridge, the greatest of its kind in the world. Then one stands face to face with history, as one sees the ancient ramparts and citadel of the historic city of Quebec. Three centuries or so is nothing to young North America—but it is something to us and we are today the vast heritage of those past years.

It is not always possible to encounter icebergs at their best, although even at their worst they are harmless, nautically speaking, except for imposing a delay of a few hours, depending upon atmospheric conditions. But icebergs are worth seeing, whether through a mist, under clouds, or, rarer still, in the bright sunshine. Americans and Canadians who are bored with their snow-topped Rockies were immensely interested in seeing their counterpart floating harmlessly on a smooth sea. Almost all the sights afforded by the Land of the Midnight Sun, whither one goes to see bergs and ice—and all so near home, too! It is enough to make a coal dealer happy and an iceman sigh.

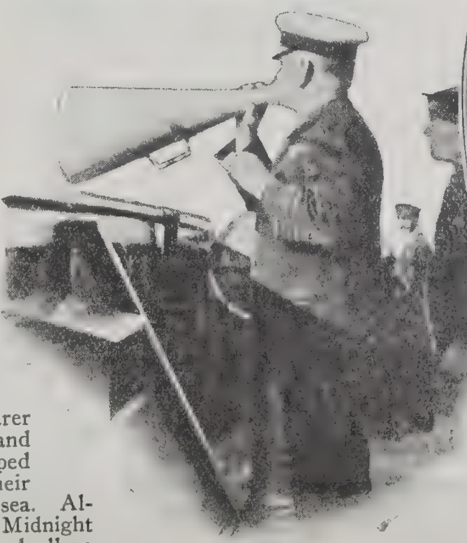
The so-called ice field of the St. Lawrence is more than ocular. It is thermal. One feels the lower temperature, in spite of overcoats, steamer rugs, and the like. To wear heavy woolen coverings in July or August two days out of Boston or Chicago is quite an experience. I appreciated it, having sweltered in New York City's Park avenue only fifty hours before.

Familiarity with icebergs breeds good-fellowship—that is why one never tires of encountering them, of comparing size, outline, shape, of indulging in fantastic mathematical problems as to bulk, volume, resistance, and so on. Even the occasional person who had felt timid at the mere thought of an iceberg became a fan on the spot. It was a scene that not only is worth anticipating, but also worth seeing again.

The first icebergs were encountered the morning of the second day out. Each chunk of ice, big and little, stood out against the sunshine, and even the tiniest growler, bobbing up and down with the waves, was distinguishable from the whitecaps. It was only a question of steering between them. From the standpoint of the bridge, where I had taken my place as a guest of Commander James Gillies, it was a lucky day because it meant full speed under the auspices of the bright sunshine, but any delay—since it involves no danger at all—is amply repaid by whatever glimpse these floating ice mountains afford. Some stood out as fortresses, low and squatty and smooth-sided; others were peaked; two that we passed had magnificent archways through which a small vessel could easily pass. Another was ornamented by a tall lateral spire, and as we approached it looked like a cathedral done in white marble standing upon a restless field of greenish hue.



Oil burning furnaces.



Above—Same furnaces burning coal.

Commander Gillies was good enough to recognize and compliment my profession to the extent of veering toward it close enough for me to photograph it—a courtesy that in turn was appreciated by scores of kodaking passengers—and this led to a question, in the face of something I learned a short time before, that many of the chief officers of a ship often stay in their cabins to protect themselves against silly questions.

So I submitted one.

"What would happen if we hit the berg ahead?"

"Nothing much, to the berg," laughed Commander Gillies. "This ship is of 25,000 tons and that berg weighs, roughly, 400,000. We are making eighteen knots an hour. All I could promise would be some cracked ice, but not much of it." The commander is a Scotchman and he wanted to be thrifty even with his joke.

But when the fog descended upon us it was another story.

By the clock it was yet early evening, but by mere light it was dark indeed. I stood on the bridge beside the commander, who always takes charge at such occasions, and remained with him until late, when the fog lifted somewhat. He was grim and silent; overcoated to the ankles, and with an astrakhan cap almost over his ears, as though it were midwinter, he peered through the fog as far as his good eyes' glance could reach. Accustomed as he was to horizon distances and the vague differences between mists, clouds, smoke, land, and debris, he could determine offhand what he perceived, while my untutored eye, equally good as to vision, was obliged to work out the outline, as it were, of whatever it was that we were looking at.

Long since the bridge telegraph had transmitted orders to proceed at slow speed, which meant a reduction of about ten knots an hour, with the crew standing by. The usual lookout was at his post on the foremast, but another, an emergency lookout, with megaphone in hand, leaned against the railing at the prow, ready to report the unexpected if necessary. It was upon this man that Commander Gillies' eye remained virtually all of the time, and for the moment the speed of the ship depended upon these two men, who represented the A and Z position aboard—the one a commodore and the other a sailor, and in the end resting upon so slight a thing as human sight.

Two decks below, the passengers, aware that there was a fog and that bergs were about, oblivious of the problem, made ready for their customary evening dance after the usual hearty meal. Except for the fact that I, privileged to be on the bridge, was fully informed of everything that was going on, what each signal meant, the alertness of navigating officers assisting the captain, the man at the wheel, the blowing of the siren from the

(Concluded on page 13)

Miami—A University That Does Things

Yale of the Middle West in the Days Before the Civil War, Ohio Institution Again Attains High Estate of Former Years

By EMERSON ROBINSON

RAYMOND M. HUGHES,

President of Miami, to whom the institution owes much of its growth.

MIAMI UNIVERSITY, at Oxford, Ohio, the Yale of the Middle West in the days before the war of the states, again has attained that high estate to which her early tradition pointed. And she is progressing, for under the administration of a president of ideas and ideals, she has become within the space of a few years one of the foremost among the higher institutions of learning in America.

Raymond M. Hughes, who has been directing the affairs of Miami for years, has instituted a number of progressive reforms, or rather, movements, all designed, of course, better to help the individual student.

His latest problem, and one that he has not solved, is attracting attention the country over. It is this: To put the human element in a university education. In the big universities of today the individual receives little attention from the faculty. It is physically impossible for the president, dean and professors to give the attention that is demanded, and only students of exceptional ability, or possibly participants in some escapade, come under the direct eye of the president; a few more meet the dean, and a still larger number meet and mingle with the professors. But this is limited.

President Hughes in the last school year was able to meet personally only 400 of the 1,100 students enrolled. During this year, because of added responsibilities, he will be unable to meet even that number of an enrollment of 1,500. Mr. Hughes believes this to be the greatest problem confronting the American university. He believes that the faculty must be in personal contact with the students if the best results are to be obtained. He is trying to meet the situation at Miami and has some plans which he believes will solve the problem. He is now turning over in his mind a practical method to put this plan into execution.

President Hughes presents the problem very clearly:

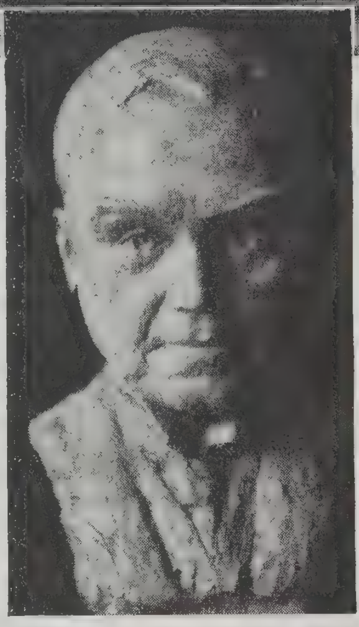
"Within the last twenty years there has been an enormous increase in the size of the institutions of higher learning in America. While the enrollment has grown four or five times what it was in 1900, the number of colleges and universities has grown very little indeed. The result is that we have a large number of colleges of liberal arts, engineering and agriculture which number a thousand or more. In these large colleges where one dean is responsible for looking after the academic standing and the personal problems of from one to five thousand students there is a relatively small amount of personal contact between faculty and students. In a small college of one or two hundred students every member of the faculty knows all of the students and the personal relations of teachers and students naturally are intimate and personal. Where the number of students in the group is very large the teacher feels the impossibility of knowing all the men and women and as a result feels very slight responsibility to know any of them. One of the greatest problems confronting our American colleges today is to devise some method of maintaining close personal contact between the teachers and students.

"This matter is met in Cambridge and Oxford, England, by including in one university twenty or more colleges enrolling from one to two hundred students. There each college has a residence hall with housing capacity for a certain number of students. The number that can live in the college hall comprises the college and sets a natural limit to the enrollment.

"It is impossible for us in a short time to provide dormitories for all of the men and women in our American colleges, and a subdivision of the present number of large colleges in the country on the basis of residence apparently is impossible. It does seem conceivable, however, that our large colleges could be subdivided into smaller units of 150 to 250 students each, each unit under the supervision of a dean who would have a personal human interest in each student and who would know them all. It seems also possible that some of their freshman work could be done in common under an instructor who would be delegated to that college and through this subdivision there would be at least a dean and five or six professors who would know personally the students in each college.

"Unless some such subdivision of the large colleges is made within another twenty-five years, it seems highly probable that all personal contact between the faculty and the students, at least those in the lower classes, will be at an end and higher education in America will be a wholesale matter where students are treated in groups and where their education is impersonal and largely lacking in the elements which make for the greatest value in teaching."

The gymnasium. Recently moved to make way for a larger and more pretentious building.



EDGAR STILLMAN KELLEY,

Composer, whose symphonies have delighted the civilized world. Photo from a clay bust by Miss Arvia Mackaye, daughter of Percy Mackaye.

When President Hughes devises a method of making this subdivision at Miami, he will present it to his board of trustees. Those who know this quiet, cultured, modest educator best believe that he will find such a way. He has solved many other difficulties and this one, they assert, will be no exception. The many changes that he has instituted at Miami have made history in American colleges, or will make history, and this, the most important question, demands settlement.

* * *

Intramural athletics, for instance, has received much attention within the last few years, solely because of the record at Miami. President Hughes believes that it is better to have 1,000 students physically fit than have 100 in intercollegiate contests and 900 taking their exercise by proxy, in rooters' row. At no other university has this form of athletics made the remarkable progress that it has at Miami where 97.4 per cent of the men participated last year in games within the college. Only twenty-three per cent participated in the intercollegiate contests.

This system, too, has had the effect of strengthening the representative teams and Miami's prowess on the football gridiron has won for her the Ohio Conference championship year in and year out, with one exception, for many years.

Golf is one of the recognized sports and it is the only university in the country, as far as is known, that has a course.

* * *

A College of Commerce and Business is a new school which President Hughes hopes to have in operation next year. Action by the Board of Trustees is expected shortly. The function of this institution is to combine a cultural training with a thorough understanding of business fundamentals and technical knowledge, to the end that the student will be fitted for some specific work when he is graduated.

Students will be assisted in "finding themselves" by a vocational director, and the president hopes thereby to remove the cause for some of the criticism that colleges do not prepare men to earn a livelihood. This experiment will be followed with interest, not only by other college presidents but by business men.

* * *

Hanging on the wall in the office of President Hughes is a chart, resembling, in a way, the report on progress of production in a huge shop. He can at a glance know health conditions in the university, for the chart is the hospital report. Miami is one of a few, perhaps it is the only one, which makes medical supervision of each student a distinctive feature. There is now a hospital, a physician and three nurses, and contracts have just been awarded for a new structure to cost $85,000.

Each student is given a thorough medical examination at the opening of the college year. The physician and the athletic director co-operate and if the young man needs a course in physical exercise one is prescribed for him. An assessment of ten dollars entitles the student to a free examination at any time and three days in the hospital free of all charges. If he remains longer the charge is a nominal one.

* * *

Boarding of students may be a problem for some colleges in small towns, but not for Miami. There it has been so systematized that it has failed to be a problem. More than 800 students are taken care of in the four dining halls. A charge of five dollars a week is made for the boys and four dollars and fifty cents for the girls, and of the total collected, seventy per cent is spent for food. There is little or no profit; neither is there a loss. It is operated on a self-sustaining basis and at Miami that means exactly what it says.

Two more dining halls and two additional dormitories are to be built, and this, of course, will take care of more students. In addition there are eleven fraternity houses which accommodate large numbers.

* * *

Some of the young men now attending Miami are getting an intensive course in efficiency and accuracy. They may not appreciate this fact now but in later years it will come home to them with force. In every university there are many activities which require the handling of money: the college paper, athletic contests, theatricals, and similar undertakings. At Miami there are sixty such organizations and they handle between $130,000 and $140,000 a year. Every cent is accounted for, and grafting is eliminated from the vocabulary.

The treasurer of each one of these organizations is required to keep a budget and to file his report on printed forms furnished by the university. An audit of the books is made once each month and there isn't a complimentary ticket issued for a football game to a newspaperman or to the president of the university that does not show on the report.

* * *

Jazz poetry, like jazz music, can find a ready market, but poetry that endures through the ages cannot be disposed of so easily nor at so good a price. President Hughes believes that it is up to the universities of America to provide for this class of writers. With this end in view he established a fellowship, which carries with it an appointment and salary with no duties, and appointed Percy Mackaye, poet, to the position. He believes that it will be productive of good results. It gives to the holder of the fellowship ample opportunity to do his work unhindered and without financial worries and it gets away from the medieval practice of the rich or powerful providing for their needs while poets built lasting monuments to the age in which they lived.

* * *

Another unusual work at Miami, established within the last year by E. W. Scripps, noted publisher, is a research foundation for the study of population, with Dr. Warren S. Thompson, of Cornell, as research professor. This is unique in the annals of American history and its effect on the future of the country remains to be seen.

That it will be tremendous, however, is self-evident, for the study will include assimilation of immigration, the number of people the United States can support, mixture of the races, the soil, and other problems. Its ramifications are so many and so varied that the subject becomes almost unlimited, but to those who look into the future, most important.

* * *

There is one other feature of the modern Miami which distinguishes it from other universities. The president believes that every one who earnestly desires a college education is entitled to it and that he should be given assistance, so Miami has a fund of $37,000 out of which loans are made to those students who need help. By this method more than 300 young men have been given the advantages of a college education. Between $7,000 and $8,000 is now in the hands of the students, or those who have been graduated, the university holding their promissory notes with no chattel security—in fact, with nothing but the promise of the men to pay. The fund has not lost a cent except in one instance: a student who owed $75 died and the notes held against him were canceled. More than $11,000 has been paid back in the few years in which the fund has been available. Interest is charged at the rate of two per cent, payable quarterly, during the course. After graduation, the interest rate is four per cent. Not more than $250 has ever been lent one student in a single year. This sum, together with what the recipient may earn and save during the vacation period, will pay all necessary expenses.

So much for the glory of Miami that is. The glory of Miami that was is a romance of the early days when America, Western America at that time, was young. It is the story of the Miami of the saintly McGuffey, whose memory is enshrined in the hearts of millions of the older generations and whose influence on the life of America never can be estimated; the Miami of Whitelaw Reid, diplomat and journalist; the Miami of Benjamin Harrison, former President; the Miami of educators, statesmen, ministers, business men.

Miami was established by act of the Ohio legislature in 1809 and was to be within the famous Symmes Purchase, which included lands between the Big and Little Miami rivers. But various things intervened; the township allotted to the school was sold; Lebanon was first selected, and then dropped, and finally Oxford, twelve miles from Hamilton, chosen. In 1818 an academy was opened. In the summer of 1824, the early settlers read that Miami University was to be opened as a college. It was one of the first colleges west of the Alleghenies and one can easily imagine the excitement when those hardy pioneers learned that they would have an opportunity to send their boys to such a place.

The early records show that students came over mud roads through the wilderness on horseback. Some came by canal boat to Hamilton and got to Oxford as best they could.

But what would the prospective college student of today think were he to read the following announcement:

"Study hours, 5 to 7 a. m., 2 to 5 p. m. Recitation 7-8 and 9-12 a. m. Prayers, 9 a. m and 8 p. m."

Total expenses for the term were fixed at $93, of which payment for board was $50 and room and servant's hire $5.

Nearly 100 students had enrolled before the end of the first college year.

Robert H. Bishop was the first president and he was a strict and religious man, a Scotch Presbyterian. Associated with him for a decade after the first two years of the college was William H. McGuffey. The name brings pleasant memories, memories of delightful days in happy childhood, spent ofttimes over the lessons which he made possible; McGuffey, whose passion was preaching the Gospel and studying the mind of the child.

McGuffey was only a young man, just out of college, when he went to Miami. Tradition relates that he was stern, and a strict disciplinarian. In his spare hours he traveled about the countryside with his stovepipe hat and his shiny suit preaching to the little congregations in the hamlets. He was a quiet but an impressive speaker and had no difficulty interesting his students. He loved children and studied them, and it was while in Oxford that he made the notes from which his original readers were written. They were later published in Cincinnati.

Two graduates of the early Miami, William Dennison and Caleb Smith, were members of President Lincoln's cabinet. General Robert C. Schenk was ambassador to England, envoy to various other countries and a member of the commission which settled the disputes between England and America in 1870.

Ben Harrison was a studious, serious-minded youth, and perhaps in those early days he had visions of the high estate to which he would be called. He was of the class of '52, and took an active part in the college life and in the more turbulent history of his fraternity.

In A. H. Upham's book on Old Miami, he recalls that on the commencement program for 1852 Harrison was one of the speakers, although one would not have known it from the name on the list. The program read:

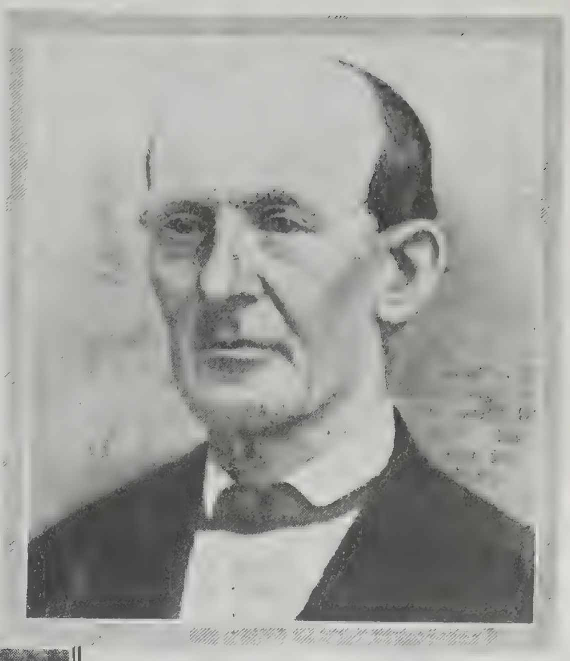
"Poor of England" . . . . Benjamin Harris, North Bend.

The author makes the comment that the irony of fate and a printer's proof bungled the name of the only man Miami ever sent to the Presidency of the United States. His address was vociferously received. Shortly afterward he returned to Oxford and was married to Miss Caroline Scott, daughter of the head of one of the women's colleges.

Four years later, Miami graduated another young man who was to play no obscure part in American history. This was J. Whitelaw Reid, described as a "long-haired, pale-faced, graceful youth, industrious, nervous and ambitious." Ambitious! His ambitions were surely realized in his career as a journalist and diplomat and his fame reached its zenith when he was chosen as one of the five American commissioners to draft the peace treaty with Spain, and again when he was named as the President's special ambassador to the Queen's Jubilee, celebrated in England in 1897.

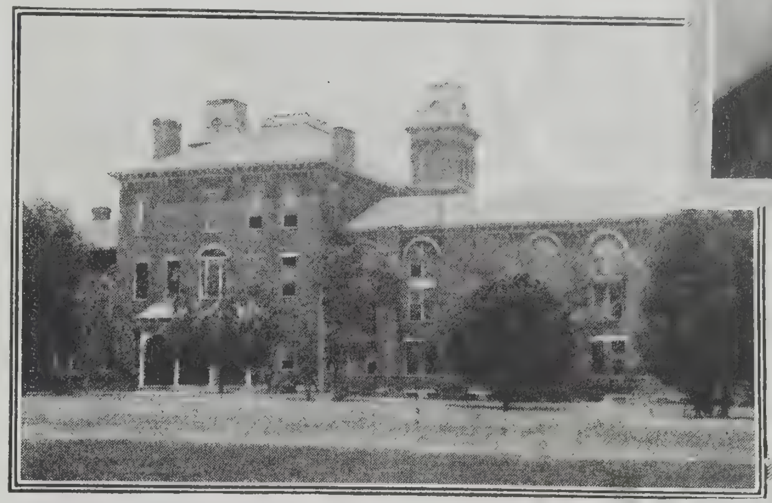
There are others, plenty of them, scores of them, who have served as governors, senators, representatives, served the public in every important capacity.

Greek-letter fraternities flourished in those days of long ago. Two were founded at Miami before the Civil War, Beta Theta Pi in 1838 and Phi Delta Theta in 1848. Another, Sigma Chi, was founded in 1885, and a fourth, Phi Kappa Tau, in 1907.



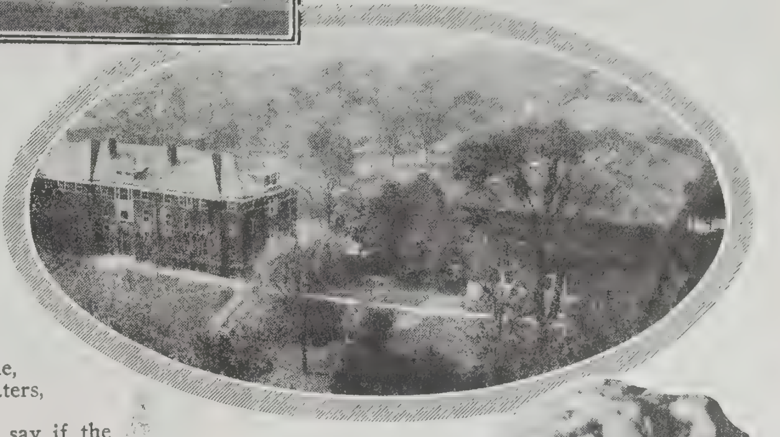
WILLIAM H. M'GUFFEY,

One of the first professors at Miami.



Left—The main building at Miami. The central portion is 90 years old and it was in there that the saintly McGuffey taught and perhaps received his inspiration for his famous eclectic readers.

Below—Bird's-eye view of Miami.



History tells of the early rivalries of the students' organizations, college politics and college life and it records some of the rules laid down by one of the first presidents. Here they are:

"No student shall wear about his person pistol, dirk, stiletto, or other dangerous weapon."

"Any student who takes part in a duel with deadly weapons, shall be immediately dismissed."

"No student during his term time, shall attend balls, horse races, theaters, and so forth."

What would the student of today say if the latter rule were read at chapel tomorrow morning? The population of the colleges of the country would be sadly reduced within a few days if it were enforced as it was then.

Students came from the Middle West and the southern states, and shortly before the beginning of the Civil War there were several hundred. There was a suppressed feeling that trouble would result over slavery but this was not permitted at any time to show itself, either by student or faculty. When hostilities began, however, the Southern students left immediately and with the call to arms of President Lincoln, the ranks of classmen thinned rapidly. Miami played a brilliant part in the preservation of the Union, but with the war, her early glory began to decline. The student body was decimated to such an extent that in 1875 the institution was closed. Trouble also was experienced in getting funds. It was not reopened until 1885, when John W. Herron, now dead, became president of the board of trustees. Chief Justice and former President Taft married one of Mr. Herron's daughters. Mr. Herron was succeeded by Walter L. Tobey, Hamilton, Ohio, publisher, who, with other members of the board of trustees, has co-operated with President Hughes in his program of progress.

There is also operated as a part of the Miami University plant, the McGuffey school to which residents of the community send their children. This school, by the way, and the Oxford high school, graduated about fifty young men and women last year and ninety-five per cent of them attended Miami.

Another feature that attracts a large number of students is the Teachers' College. Practical training here is given in the McGuffey school.

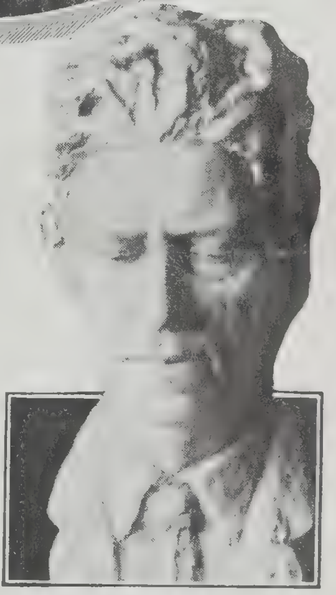
It was not long after Miami formally was opened until the need of a women's college was felt and private academies were established. These continued until 1849, when the Oxford College for Women, a denominational college, was opened. Four years later, the Western College, also for women, was ready for students. The primary idea for the women's colleges was to accommodate the sisters of the men at Miami.

The Western College has established a fellowship comparable to that which Miami established for Percy Mackaye. The recipient of this fellowship is Edgar Stillman Kelley, noted composer, whose symphonies have attracted world-wide attention.

In President Hughes, Miami has an executive whose name is familiar in every institution of higher learning. It is conceded that he knows more about colleges and college life in America than any other educator. He has received signal honors from the state and nation in educational surveys, and often is called into consultation with heads of other institutions. He is not bound by tradition and is ready at any time to blaze the trail along new lines, once he is convinced in his own mind that it will result in better training for those whose education is intrusted to his care.

President Hughes is fortunate in having a board of trustees eager to help him in his plans for the advancement of Miami, and who give unsparingly of their time in this work. The university is supported by the state and its growth is limited only by the facilities provided to care for students. Now the campus comprises 146 acres. There are fourteen buildings, and the plant is worth in excess of a million dollars.

"Old Miami on the Hilltops," sang the students in their corduroys and buckskins and homespun suits. The glory of the first Miami was great; the glory of the present Miami is greater; and the future augurs well for a glory to outshine all the rest.



PERCY MACKAYE,

Holder of the fellowship at Miami, poet. Photo from a clay bust by Miss Mackaye.

A Miami of 5,000 students within a decade is the dream of the alumni and the hope of the president and faculty. It is a dream and hope born of confidence in a program of progress designed to meet the exacting requirements of modern America that universities prepare men and women for active life immediately they leave such institutions.

Officials believe that the day is not far distant when the enrollment will increase even more rapidly than it has in the past. Every effort will be made to meet the demands made upon it and with this end in view negotiations recently were completed for the purchase of the adjoining farm and buildings of the Oxford Retreat, a private sanitarium. The purchase price was $200,000 and possession will be given the university in two years. It is felt that the space will be needed at that time despite the additional dormitories and other improvements now in course of construction.

The main building of the Retreat was the first College for Females, established at Miami by a church denomination as a college for women exclusively. Many of the early romances of Miami were written about this building and it was there that Harrison wooed and won the future First Lady of the Land.

Whether it will be used as a dormitory is not now definitely decided. The suggestion has been made that it be converted into a college of music, and this has gained some favor among the graduates. It may also be used for the department of commerce and business.

A Visitor to Washington Should See the Market

A Display of the Food Products of a Nation Is Afforded

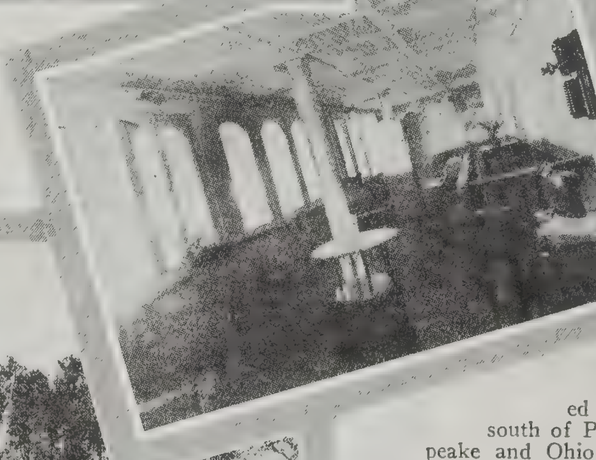
By S. R. WINTERS

IF YOU are contemplating a sight-seeing tour of the national capital, quite naturally your itinerary will include visits to the White House, Mount Vernon, the Capitol, Zoological Park, Congressional Library, and other national institutions. An objective point which may or may not be on the prearranged schedule, should be a tour through the Center Market. Of course, a food emporium—meat stalls, fish stands, and the like—do not smack of the dignity of the White House or suggest the imposing magnificence of the Library of Congress, but the things to be seen may be none the less interesting.

Municipal markets ordinarily may be commonplace, but Center Market affords a display of the food products of the nation—and, indeed, many of its articles of food come from foreign countries. The variety of things for sale is infinite, ranging from frog legs and flowers to sassafras roots for brewing your own tea, and honeydews and nectarines from South Africa. This market place is one of the largest in the United States, transacting a business of approximately $14,594,904 during the last fiscal year. Moreover, it is probably the biggest food emporium in the world under the ownership and supervision of a government, for Center Market is owned and managed by the United States Department of Agriculture. This branch of our Federal Government, however, has been filling the "market baskets" for the thousands of Washington citizens for only a brief period of time, having recently completed its first twelve months in the capacity of master trader in the market places.

Of course, Uncle Sam acts in a more or less administrative capacity in the operation of Center Market, for which the Federal Government paid $960,250 for the buildings and equipment. Representatives of the Department of Agriculture do not actually wield a meat knife and barter beef over a counter. Instead of this, Uncle Sam leases spaces in these buildings, measured in terms of city blocks, to 173 private operators. Forty-nine of these sell fresh meats, twenty-five offer for sale cured meats, twenty-four engage in the business of disposing of fruits and vegetables, fifteen barter dairy products, an even dozen sell the products of bakeries, and there are ten poultry and game dealers, nine florists, nine delicatessen stands, six fish dealers, five full-fledged grocery stores, and six reservations devoted to the sale of miscellaneous articles, including confections, honey, market supplies and rare articles for the discriminating dietary judgments of half a million people, more or less. There are, strangely enough, two stalls devoted to the sale of clothing and notions.

Vegetable stand.



Rest room.

Center Market.

The diversity of the offerings of Center Market is well-nigh proverbial. Its sources of supply are located at the near and far points of the United States, and they are even world-wide in range. Apples grown in California, New York and Virginia, are available in this government emporium; lettuce from California or New York is readily obtainable; strawberries are imported from Florida, North Carolina, Louisiana and Tennessee; potatoes produced in Maine or New Jersey may be purchased in this centralized market place as though they were raised in the District of Columbia. Fancy fruits—grapes, peaches, pears, plums, honeydews and nectarines—are likely to originate in Argentine, South Africa or Belgium. Fancy cheeses are received from Holland, Italy and South America.

Not by any means, however, are all the commodities of Uncle Sam's market place brought from far-flung centers of production. A fleet of motor-driven vehicles traveling the highway from Baltimore to Washington, groaning under the burdens of fresh meats, each morning suggests that Maryland is the scene of abattoirs or slaughterhouses for supplying the national capital with its beef, pork and mutton. Farmers, too, contiguous to this city, offer their home-grown foodstuffs to consumers of Washington. Space for 200 farmers or their wives is reserved on the south side of Center Market where they may dispose of fruits, vegetables, dairy products or other commodities of the farm, directly to the consumers. Three days each week this feature of Uncle Sam's market place is in operation, farmers or their wives journeying as much as fifty miles to the national capital. Here, in this reserve space, home-grown products compete with commodities from a distant state, the consumers finding a variety that will satisfy the most critical buyer.

A public cold-storage warehouse and refrigeration pipe line to supply refrigerants to 600,000 cubic feet of space is an essential auxiliary unit. A portion of this space is utilized to maintain cooler boxes and cold rooms. Refrigeration, in the main, is for public storage purposes, and a portion of the space is cooled under refrigeration contracts. In conformity with the practice in other public cold storage warehouses, the products subject to refrigeration are received and delivered on negotiable and non-negotiable warehouse receipts.

A bowling alley, billiard parlor, café, office of the superintendent, and a spacious auditorium occupy the second story of this market place. The auditorium is rented as space for playing basket ball games, and as a place for conducting bazaars, receptions, dances, conventions and food exhibitions. Rest rooms—two of them, spacious and modern—provide recreation facilities for patrons of the market, and for tenants and employes of this big food emporium. All told, there is a force of sixty persons engaged in the operation and supervision of this market place, this personnel including inspectors, accountants, refrigeration engineers, electricians, plumbers, carpenters and common laborers.

The rules and regulations governing the conduct of Center Market are promulgated by the Secretary of Agriculture. A stringent sanitation regulation is in force, which makes it obligatory that meats offered for sale be inspected daily.

Since Center Market reverted to the supervision of the United States Department of Agriculture, the Federal Government has expended for repairs, improvements, and salaries of personnel a total of $176,000. During the first year of government operation, the Department of Agriculture collected from lessees of the premises approximately $233,000. Thus, the profit realized from the twelve months' operation is about $50,000, a sum that automatically reverts to the United States Treasury Department. The volume of business transacted by the tenants of Center Market during the last fiscal year approximated $14,594,904, a figure that will doubtless be exceeded during the current twelve months. These figures do not include the revenue derived by farmers from the sale of foodstuffs at 200 stands on the south side of the market.

The repairs and improvements already completed at Uncle Sam's market place represent an investment of $25,000, not including cost of labor, which service was rendered by mechanics of the regularly employed force. The new marketing facilities—in the form of fruit, vegetable, fish and poultry stands—were designed and built to serve as models.

The administration of the Center Market makes a departure in one or two particulars. It issues a daily list of commodities with their prices. These data are supplied to Washington newspapers for publication. An innovation—and a decided one at that—is the application of radio telephony in the dissemination of the prices of commodities at this market place. The broadcasting of this information is of value to both the producers and consumers of foodstuffs. The farmers, in the event of their having ownership in radio-telephone receiving outfits, may be informed of the market prices of commodities speedily. Housewives of Washington, on the other hand, by the use of the radio telephone may make purchases of fruits and vegetables for canning purposes when there is a surplus.

Aside from its utilitarian purposes—and who can discount a food mart in this particular—Center Market is a landmark of the national capital. Who among the thousands that annually saunter, ride on a street car, or travel by motor-driven vehicle down Pennsylvania Avenue, has failed to see these low-set, somber-looking, red brick buildings—not far removed from the avenue?

Historically, marketing facilities for Washington date from the original plans of General George Washington in suggesting to Major L'Enfant the necessity of providing a centralized trading mart. The site of the present Center Market, by the foresight of the founders of the national capital, was reserved for the purpose it serves today. Sheds, unkempt in appearance and roughly built, were erected in staggering fashion along a line south of Pennsylvania Avenue to the Chesapeake and Ohio Canal, which extended along B street. This resolved itself into an island of Southwest Washington. Live stock—hogs and cattle—was butchered on this site. Farmers bringing their pigs and calves to market would excite the interest of famous personages of that day. A legend is told that Abraham Lincoln, on his way to the Capitol, would halt his carriage to indulge in conversation with farmers, surrounded by droves of swine. Another story avers that President Martin Van Buren, while strolling along Pennsylvania Avenue, became enmeshed in a rope used by a boy in leading a goose to market. This dignified personage had his hat toppled off his head into a puddle of mud.

The original sheds built on this centrally located market place, in the course of years, assumed an unkempt and unsanitary appearance. This condition was responsible for a storm of criticism, resulting in repeated investigations. An outgrowth of this public censure was an authorization by the Congress of 1860 to the Corporation of Washington, the local government of that period, to borrow up to $200,000 to build a marketing establishment within two years. A brick wall placed along the front of the grounds facing Pennsylvania Avenue was the extent of the progress of the building within that period of time.

With the elapse of another decade—in 1870—the unsanitary conditions of the market place crystallized a voice of protest of the citizens. Fortunately, or unfortunately, the sheds were razed to the ground by an outbreak of fire in December of 1870. Congress soon thereafter created the Washington Market Company, specifying twenty-six individuals as incorporators. The capital stock was $1,000,000, consisting of 20,000 shares of $50 each, the purpose of which was to erect a market building. The land upon which the present Center Market stands was set aside for the use of the Washington Market Company. A clause in the charter of incorporation specified that at the expiration of ninety-nine years the improvements were to revert to the United States Government. Likewise, a provision in the charter indicated that after the passage of thirty years, the Federal Government might assume possession of the market upon reimbursement to the Washington Market Company a sum of money commensurate with the valuation of the buildings and improvements.

Some of the reservations for the sale of food products have remained continuously in the same family, the opportunity to sell foodstuffs having been handed down from one generation to another. Many patrons have been trading there for nearly three-score years.

A "Homey" Eastern Garden in California

More Than a Copy, Ten Acres Really Are Transplanted

By HENRIETTE BOECKMANN

A row of yellow-dock grows with luxuriance halfway down into the glade.

MOST cherished among treasured memories of an easterner who has become western is that of the "old home" and the adjoining woods and meadowland. And for such a one to have memories renewed in the land of his adopted home were to be granted a boon totally unlooked for though richly appreciated.

A mile out of Compton in Southern California is just such an oasis for memory's refreshment—a wild eastern garden growing in all the natural grace of those on the other side of the continent. It is more than a faithful copy. It is a transplantation.

Unique indeed is this garden covering ten acres of softly rolling ground in a flat countryside with miles of fields planted to sugar beets broken at only wide intervals by a short row of Lombardy poplars, a palm or two, or by the dark blot of a eucalyptus grove—a perfect picture as of an old French etching of the countryside. Dr. Joseph A. Munk, physician, college dean, writer, scientist, cattleman and enthusiastic horticulturist, is the originator, planter, and still caretaker, though he is now in his seventy-fourth year.

"I laid out the garden with two purposes in view," said the genial doctor, a summary of whose life work appears in the American "Who's Who." "One was to have a garden of natural arrangement and the other to see with what success I could grow an eastern wild garden in the West.

"It was also due to my interest in medicinal plants, so many of which grow in eastern woods and meadows, that I planted the garden."

Far from the "beaten path" of tourists who motor in endless procession along the boulevards running parallel with Southern California foothills, where so many of the show places lie, is Dr. Munk's wildwood, and far more genuine and elusive is the charm of this garden than any other I have visited. (It may be advisable to here give out the information that the writer is a native daughter and should therefore have license to make such a remark.) Thus has this garden grown on, uninvaded by the tourist host, although it has been in existence since 1905.

A stretch of woods bisected by a brook, a broad, open garden of flowers and shrubbery, and a spreading grove, compose this domain whose flowered and foliaged occupants have answered the westward-ho call.

Without further delay the enigma of a brook in sun-baked Southern California should be explained. The brook is fed by an artesian well, a product of nature frequently found in the vicinage. The garden is on an alluvial plain seventy-six feet above tidewater. Not a grain of coarse sand or gravel, nor a piece of any kind of rock, unless imported, is found over an area of many miles. Furthermore, the place has the benefit of the daily cool sea breeze and frequent fogs from the Pacific during the summer months, with an occasional touch of frost in the winter. The frost seldom amounts to more than ten degrees and for but a short time during the early morning hours. Rarely is any damage done, the land lying midway between the frostless seashore belt and the foothill thermal belt.

A long drive leads into Dr. Munk's country home between treeless fields of glowing green sugar beets to the comfortable two-story farmhouse. Even upon arriving at the veranda fronted by poplars and a great weeping willow, one has no inkling of any of the unusual aspects of the place, leaving the entrance into the domain of the eastern wild garden as all the more of a revelation.

Following the short stretch of curving roadway closely beset with poplars, there is unexpectedly displayed a beautiful little sunken glade—a spot of shaded greens that seems as an opened flower catching the sun in its chalice. The trees which surround three sides of it form a part of the southern border of the woods. A row of yellow-dock grows with luxuriance halfway down into the grassy glade. The great, glossy red-veined leaves are far more showy than western dock. Burdock also grows here to recall instantly that beloved childhood story of "The Ugly Duckling" whose stepmother laid her eggs among just such great green foliage. A clump of stag-horn sumac and an eastern elderberry are tangled together at the roadway's edge as if in battle for supremacy. The eastern elderberries in the doctor's garden throw out corymbs of flowers large as a dinner-plate as compared to the saucer size these elders attain in their native soil. The western elderberry shows corymbs only a few inches across. Doctor Munk tells of an elderberry picker he rigged up in his boyhood by means of a spinning wheel and some cross-laid sticks over which the corymbs of berries were held to be as neatly whipped off as if carefully picked by hand.

Along the open edge of the glade, marigold and buttonbush from Ohio spread in glory. Here and there in these gardens the visitor comes across old-time garden plants from the East, and there is also some plant booty from the mesas and mountains of Arizona where the Munk cattle ranch has been located in the heart of the Apache country ever since 1882 when those fiercest of all Indians were still frequently on the warpath. A trellis along the road opposite the glade is dense with hop vines and a western wild jasmine. Everything, including the roadway, is left entirely to nature's guidance.

Where Spanish needle and calimus crowd the brook.

A half-overgrown path leads into the woods from the road, taking its course along the old wooden fence which divides field and forest. Periwinkle with its lavender flowers carpets the ground in the woods here, with much underbrush springing up. Near the head of the path stand the only three trees existing on the place when Dr. Munk purchased it in 1905. These are a huge gold-barked willow presenting a handsome bark, a gracefully bent weeping willow and a California willow, a beautiful tree draped with English ivy. Continuing along the path one hears the low hum of running water hidden somewhere in the grasses, and then suddenly the little walk swings off into the heart of the woods. There at the foot of the slope is the brook daintily quilted over with the shiny, picoted leaves of hydrophyte. And such a delightful stretch of woods as it is! High overhead tower the close-set trees keenly reminding one of a cathedral interior, underfoot the soft rustle of dried leaves, and yonder cascades a tiny stream helter-skelter into the brook which wends onward to its ultimate destination, the white-fanged, pounding Pacific Ocean which so often belies its name.

Near the head of the path stand the only three trees existing on the place when the doctor bought it in 1905. (Left to right—California willow, weeping willow and gold-bark willow.)

The predominating tree in the woods is the Carolina poplar, the doctor's favorite tree. The spicy odor of this tree, combined with the other natural incenses, permeates the entire wood to a remarkable degree, and is most sweet and invigorating. There are several elms, a linden or basswood, and a number of ash trees. From Dr. Munk's old farm home in Ohio came the cherry tree which has succeeded in joining the other trees in panoplying the top of the woods at a height of from fifty to sixty feet, even though its trunk at the base is no more than four inches in diameter. Bravo, little cherry tree from the State of Presidents, whose ancestor our first President is supposed to have chopped down in his boyhood!

Down where the fence wades across the brook is a sunny mud bank where turtles scarce larger than a hand may be seen to the number of a hundred or more on warm days. At the slightest warning of human approach, however, they are off into the water under the hydrophyte where quivering leaves indicate their hiding places.

No feature of the woods back home has been overlooked. There is even a brush heap for rabbits! Raccoons and other four-footed creatures venture forth here when night comes and birds of many kinds fly and feed and sing in these treetops.

At the head of the path that ascends the slope from the woods into the open garden grows a large bush of eastern poison oak, and here begins a border of goldenrod of which there are fifteen varieties in the doctor's garden. Many eastern meadow plants flourish here, too.

This is a delightful place, this eastern fringe of rarely beautiful trees and shrubs. There are a number of large specimens of English hawthorne exquisitely bedecked in white blossoms in May, gayly buttoned with red berries in December. A thirty-foot tulip tree showed for the first time some water-lily-like yellow blossoms with the lovely orange blot, and still taller maples, both hard and soft, cast their shade upon a spice bush which a number of eastern visitors declared to be the largest they had ever seen. Wild eastern vines such as the wild yam and the wild grape festoon prickly ash trees.

A weather-beaten, peaked little barn, now used as a garage, marks the end of the drive. Passing around it there is disclosed the open garden in its entirety, level in places, undulating in others, a garden where flowers and shrubbery, interspersed occasionally with a low tree, grow in unmolested profusion.

"I am no engineer," said the doctor, "but I have an eye for levels and I worked out a system whereby I am able to irrigate every foot of the gardens by gravity flow from the artesian well. In a country like California where water is, of course, an important factor, it must be applied to the land artificially to make the soil productive, but I have found that in this location irrigation a few times during the summer is all that is necessary."

Presently we come to a splendid specimen of the eastern sweet shrub, a comfortably settled plant of eastern dogwood, and a redbud of which there are many

(Concluded on page 14)

Walt Whitman and Natural Democracy

Imitators of His Spirit Often Miss the Image and Extol the Mud:—Usual Fate of an Original

By LEWIS WORTHINGTON SMITH

IN THE introduction of his biography of Whitman, the French critic, Léon Bazalgette, says of him "that America, aside from a handful of followers, has never known his supreme significance." However much in doubt we may be about the final phrase in application to the poet, and I must confess that my own hesitation in accepting it is very close to unequivocal rejection, we may easily enough admit the general truth of the affirmation. In the large sense, America simply has not known Whitman at all. That among poets he is the democrat of democrats, the democracy of democracies has never discovered. In any real sense he is known only to the select few.

None the less, there are incalculable thousands of those who have never heard his name who yet today feel his influence in ways of which they do not dream. Literary forces are never quite in the open. How or why a great fictitionist or a great poet has come to write the book that we pick up from the library table after dinner no one can ever certainly say. He is part of a current of human ideas and human passions. He goes with it, but also he helps to keep it flowing on. He becomes nameless, perhaps. It may be that he is lost in the current. Then only those who are interested in tracing the current to its various sources discover with toil and patience where the yellow clay is washed into the stream and where a gush of clear spring water is lost in the muddying depths.

Europe Regards Him as THE American

IF WE go far enough back and look carefully, we shall at least have some reason for the conjecture that the yellow clay in our American stream of life is not wholly independent of the birth on a Long Island farm, in 1819, of Walt Whitman. To the Old World he has become more and more the great literary representative of our American ideals and our American spirit. The big slouch hat with the broad brim projecting darkeningly over his eyes, the heavy untrimmed beard, the shirt defiantly thrown open at the neck, have all been in agreement with the Continental understanding of what constitutes democracy on this side of the water. When to that picturesquely unconventional costume there has been added an unrestrained flow of unconventional speech on the printed page the impression has become convincing. Here, say the European enthusiasts, is the great American.

The prime doctrine of democracy as understood by many, especially by Continental Europeans, is the doctrine of equality. Every man is the equal of every other man. Every race is the equal of every other race. One way of living is as good as any other way of living. One ideal of conduct is as good as any other ideal of conduct. Pushed to its logical conclusion, the doctrine eliminates all distinctions of social classes, whatever the basis, eliminates at the same time all human values as determined either by taste or morals, by character or conduct. In a world of equality, a world in which there is no difference among human or lesser flavors, it should be just as pleasant to drink ditch water as champagne, just as exhilarating to sip cold tea as to drink in the music of a splendid orchestra conducted wonderfully through a Strauss waltz.

Equality as Between Gentleman and Rowdy

IT IS such a conception of democracy as this, and primarily of democratic America, that goes with a singing cacophony about the world in the primitive free rhythms of Walt Whitman. In the "Song of Myself" he tells how universal are his sympathies, how uncalculated and undiscriminating are the choices that he makes among his fellows.

"Comrade of raftsmen and coalmen, comrade of all
who shake hands and welcome to drink and meat,
A learner with the simplest, a teacher of the thoughtfullest,
A novice beginning yet experient of myriads of seasons,
Of every hue and cast am I, of every rank and religion,
A farmer, mechanic, artist, gentleman, sailor, quaker,
prisoner, fancy-man, rowdy, lawyer, physician,
priest."

It was not with this understanding of democracy that we set out upon the great enterprise of managing our own affairs as a free people. Neither John Hancock, of Massachusetts, nor George Washington, of Virginia, believed in the equality of the rowdy with the gentleman, of the thief with the honest citizen. Through and through, the American enterprise was grounded in the belief that human quality should count. There can be no serious question but that those who in the beginning took in hand the shaping of our destinies wished chiefly to strip from man the accidental trappings of fortune, inherited or other, so that each citizen as he was in himself should have his proper place. The very basis of any satisfying democratic ideal is the assumption that it will measurably reward the individual member of a democratic society in agreement with his deserving. Its most fitting watchword is justice. Under the banner of justice it is that most men who have enlisted in the cause of human freedom have fought. In the ranks there have no doubt been wild-eyed fanatics who have had other and more dubious purposes. Some of them certainly have been iconoclasts ready to reduce all things to the level of the common and the mean. These, however, have not been the men who have made democracy. Those who have led in the democratic ongoing here in America have been constructive spirits. They have been eager to establish a larger social good, to bring about a social order in which that social good shall be a thing steadily increasing. They have had a passion for justice, because only through justice can any social order hope to achieve its proper end, human existence that is cultivated, secure, and happy.

If there is any injustice more bitter than another it is that of an equality of reward alike for the deserving and the undeserving, for those who achieve something and those who expect to be comfortable through the achievements of others, for the boor who is content with his boorishness and the gentleman who controls his grosser impulses. Justice as a thing made actual among men is inseparable from a social consciousness, from a realization of social relationships and obligations. That consciousness, that realization, is ineffectual in a democracy if it is no more than a generous sentiment. It must go beyond that to an affirmation of values and to a choice among those values. Beyond that choice, indeed, it must become action, or the justice that is the hope and the reliance of democracy becomes no more than a figure of speech wasted on the insensate air.

In the introduction to his collected "Essays on Art," A. Clutton-Brock has a casual affirmation that indirectly touches Whitman. He says that "religion is merely mischievous unless it is tested in matters of conduct." What is true of religion is true of a philosophy, whether metaphysical, political, or practical. It must be "tested in matters of conduct," in the outcome and results of conduct. "By their fruits ye shall know them," is a text even more broadly asserting, and wisely asserting, that conduct is the great test by which, in both its thinking and its character, humanity must be judged.

No man's life can be squared quite by his creed, but when a biographer makes record of something as illuminating and illustrating a characteristically virtuous quality in his subject we need not look away. Says Bazalgette, touching that portion of Whitman's life when, in his younger manhood he was musing upon the cosmos and living with his father and mother in Brooklyn:

Man as a Fastidious Animal

"HE WAS a man among men, great and sweet toward all. In his daily life, although he did not live it as a real Bohemian, he showed himself an irregular, one careless of what other men cared for. When he lived with his parents in Brooklyn, it was rarely, according to his brother George, that he was at a meal on time. If a wish seized him to leave the house it mattered little to him that it was the hour that the family sat down to the table. He paid no attention to them and returned two hours later to sit down and eat. A mountain across the doorway would not have changed his resolution. He did everything in his own time, when he was ready."

If this were merely the showing of one of Whitman's weaknesses it might be, indeed, as a thing purely personal, it should be passed over and forgotten. The prime fact of the matter is, however, that it was a characteristic rooted in his way of thinking. Irresponsibility in the family relations, indeed, in all human relations, is our American heritage from the man who, at his best and highest, gave us the wonderful threnody on the death of Lincoln, "When Lilacs Last in the Dooryard Bloomed."

No one is compelled to accept a heritage. No people need be a poet's heirs beyond their will. Poets unnumbered die and leave no memorable trace, but when I read Sherwood Anderson's last atrocity in fiction, "Many Marriages," I know that Walt Whitman's bequest to his countrymen has been in part accepted, has been put out at interest to winebibbers at bacchanalian banquets, and has been returned manyfold in orgies of literary naturalism.

One of the great problems of every man of taste and breeding is that of maintaining walls and fences, of shutting out the uncouth and unpleasant, of holding a fortress of life secure against the encroachments and intrusions of vulgarity and philistinism. It was that every man might be free in the possession of his own, that he might grow to his fullest stature untroubled, it was to this and kindred ends that democracy was established and that law was made the corner stone of the democratic structure. Of all this, Whitman will have nothing. Taught by him, of all this the newer radicals also will have nothing. Says Whitman in "Myself and Mine":

"Let me have my own way,
Let others promulgate the laws, I will make no account
of the laws."

The confusion of values, esthetic, social, visual, and even olfactory, by which our naturalistic writers are now obsessed, goes back unmistakably to Whitman. To quote again from his "Song of Myself," he was

"Pleas'd with the native and pleased with the
foreign, pleas'd with the new and old.
Pleased with the homely woman as well as the
handsome."

This has, no doubt, its good as well as its evil face. It is evil in that it ignores differences, in that it does not understand man as possibly a fastidious animal for whom the making of choices may be a pleasure. It is good in that it is the expression of a warm and generous human sympathy. A larger phrasing of it is to be found in "In the Sunset Breeze."

"I feel the sky, the prairies vast—I feel the mighty
northern lakes,
I feel the ocean and the forest—somehow I feel the
globe itself swift-swimming in space."

This is a fine, indeed, a soul-expanding emotion. It has taken possession of many minds of the better sort enthrallingly. It is well for all of us to be touched by it in some degree, but it must still remain a question whether cosmic sentimentalism is either more admirable or more useful than ordinary human sentimentalism. It should be remembered, at least, that man can do very little for the cosmos, while it is possible that he may do something very substantial in the narrower field of his own human relationships. It is no doubt now and then an act at once of wisdom and of grace to pause reflectively upon the vastness of space and the universality of the laws that bind man to the incalculable reaches of the infinite. For man, however, the business of living is that of functioning in agreement with his nature. He may marvel at the all-comprehending of nature, her wonders of the immense and the minute. To be himself, however, he must withdraw himself from these things into his own world. He must become man. In becoming man he separates himself from nature, establishes ideals and desires of his own, and puts himself in the way of doing those things by which his desires may be brought about.

The Charm of Cleanliness in Dirt

ONE of the fresh and animating things in the work of the Sherwood Andersons and their kind is the delight that they have in the beauty of ugliness and the charm that they find in the cleanliness of dirt. In the new wisdom of babes in the woods still looking at the trees with the celestial eyes of the abode from which they have lately come, they see filth, not as cleanliness alone nor as beauty alone, but as both cleanliness and beauty together. In those beneficent presences their souls pass into ecstacies unknown to mortals less rapturously endowed. If this point of view does not derive from Whitman, in the individual case, certainly the boldness with which it now gives itself voice goes back to him.

It is not at all necessary, as a rejection of the philosophy in his poetry, to say that Whitman was not a great poet. Great men and very great men have reached conclusions about how life should be lived and about other matters less difficult that experiences outside their own have quite discredited. The thing that now most discredits "the good gray poet," to employ the term with which the ardent admiration of O'Connor endowed him, is the motley array of camp-followers trudging along behind his banner. His name is the warrant for all the wallowing in the slime of nature that to some temperaments, untutored by the experience of the race, seems most beautiful and sweet. To America he has become very much what Rousseau was to France and Europe a century ago. Rousseau had a vision of human good, even of human beauty. In its measure it pointed man the way toward the realization of some of his finer aspirations. Rousseau's misfortune was that he shaped the image of his dreams out of mud. Inevitably when the rains descended and the floods came the image ceased to be an image and did not cease to be mud. Thereafter his idolaters forgot the image and continued to worship the mud.

Accepting Mud as the Revelation

FOR unknown ages it has been the business of man, as well as his pleasure, to take mud and make it over into beauty. It is the process of doing this that is and always has been interesting. It requires effort, and the carrying through of anything that puts the faculties to the stretch is a temptation to the will. The transformation of mud, therefore, is constructively human happiness. The acceptance of mud is an altogether different matter. It may be swine happiness, perhaps even dog happiness, not more. That is not the fashion in which man lifts his head in the air, feels the joy of winds blowing on him from meadows of hyacinth bloom, and runs eagerly to meet them. It was possibly inevitable that, in the larger sweep of cosmic acceptance, Whitman should include the pettier acceptance of nature's ugly with her beautiful. That he should somewhat confuse them was perhaps also not irrational. The pity of it is that, when he has become the apostle of the new dispensation to the untaught in letters, they take the incidental grosser acceptance of mud as the real revelation. Spattering themselves with it, then, in an abandon of vicarious spiritual self-effacement, they triumphantly sit down beside us at meat. After that nearness of contact, our clothes are of the kin of Humpty-Dumpty. Nothing can ever again put them back where they were before.

Government Bulletins Illustrated by Woman

She Is the Only One of Her Sex Engaged in This Line of Work

By J. H. WALTON

HOW many times have you examined a book or magazine to see if the stories or articles were well illustrated? If the pictures were attractive you read the book or story, but if it was not illustrated at all its chances of being read were much less than otherwise.

Take this particular article for example. Would you have been attracted to it if there had been no pictures showing the action described in the text? Unless the subject is of unusual interest to you personally, it is doubtful.

Our government has also come to know the folly of issuing bulletins without pictures. Officials are now aware of the fact that these instructive works must be profusely illustrated if they are to have the widespread attention needed to accomplish their object.

Particularly is this true in the Department of Agriculture, where a staff of artists and photographers is kept busy producing drawings and pictures, not only to illustrate bulletins and circulars, but to be circulated broadcast to schools, colleges and fairs.

Many of the farmers' bulletins issued by this department relate to the economic grasses and best forage crops. The illustrations for most of this class of publication are made by Mrs. Ellen I. Schutt Wallis, special artist, working under the direction of Professor C. V. Piper. These drawings are usually done in pen and ink and wash drawings, and require unusual skill and patience, many of the tiny flowerets being drawn under the microscope.

When I called Mrs. Wallis was busily engaged reproducing one of our best-known grasses, the Kentucky blue grass. Like every lover of his work, however, Mrs. Wallis was glad of the opportunity to talk about it and explain in detail regarding the various kinds of grasses, fruits and flowers.

Mrs. Wallis told me something of her earlier work:

"It has always seemed to me that to succeed one should *love* one's work and should choose for a profession the thing most suited to his talents, then bend every effort to obtain that work.

"With this thought in mind, and just a love for botany, an eye for color and the ability to draw and paint, I started out to make myself a scientific illustrator. It meant study and hard work, but the efforts were successful, and, passing the required civil service examination, I was appointed illustrator of fruits in the United States Department of Agriculture.

"My first work was making models of fruits for exhibition purposes. At the various fairs all over the country are found beautiful displays of fruit, and the question is always asked, 'How often do they change the fruits?' Few persons realize that the lovely apples, pears and peaches are wax models, painted so true to life that they look real. Besides showing new varieties, these models are used to show various methods of packing fruits for shipping and marketing. Five hundred of these were sent to the Louisiana Purchase Exposition at St. Louis, and later to Portland, Seattle, Boston and finally to Brazil.

"When this work was completed I was appointed to the Division of Pomology to make water color illustrations of fruits for identification purposes and for the year book to show the promising new fruits each year, the plates being signed in my maiden name, E. I. Schutt.

"During the summer of 1910, on a trip with my mother over the Canadian Rockies and to the Pacific Coast, I was authorized to take up work for the department, painting the fruits from the field in California. It had always been my ambition to paint the grapes fresh from the vines, with their beautiful bloom undisturbed; the apples from the trees.

"In 1914 I resigned from the department and went to live in Florida, but was soon called to the University of California to make the first series of paintings for that college. The paintings in this instance were used in a lantern projector and thrown, greatly enlarged, on the screen, so that a whole classroom of students could study the variety from these specimens. I leave you to imagine how accurately these apples had to be finished to pass such a test.

"Although I again returned to private life, my work still called me, and lately I have taken up my chosen profession, this time illustrating flowers and grasses. As the tiny flowerets of grasses can only be drawn under the microscope, they open a new world—a fairyland of their own, and the delicate blooms look like the gauzy wings of the butterfly.

"This uncompleted work I have before me is Kentucky blue grass. This, with the possible exception of timothy, is the most noted grass in America. It is well known for the beautiful lawns which it makes, as well as for the highly nutritious pasturage it furnishes.

"Perhaps because of the famous blue grass country in Kentucky the opinion prevails that this grass is a true native. Such is not the case, however, and blue grass did not grow in Kentucky when Daniel Boone discovered that attractive region. Like most of our best-cultivated grasses, blue grass is a native of the Old World, where it occurs naturally."

Mrs. Wallis is frequently called on to do work for other divisions within the department. Her fine perception of colors and the ability to reproduce them so accurately has made her of invaluable aid in illustrating leaflets and bulletins showing the ravages of the white pine blister rust.

Mrs. Wallis painting the diseased pines in their native environment.

MRS. ELLEN I. SCHUTT WALLIS,

In her studio.

"Early last spring," said Mrs. Wallis, "I was sent to New Hampshire to make a series of paintings of the white pine in its natural state, showing the development of the blister rust from its earliest beginnings to the most advanced stages. These paintings are photographed and sent to schools for use in classrooms, as well as being used to illustrate bulletins.

"The white pine is one of our most beautiful and useful evergreens, thousands of them growing in parks, on estates, and around homes. The blister rust, a disease imported from Europe within the past 20 years, cannot spread from tree to tree. It must first pass through a transitional stage on currant or gooseberry leaves before it can infect the pine trees.

"It attacks pines of all ages, quickly killing young trees and seriously damaging old ones, ultimately causing their death also. The effect of the blister rust, especially on large trees, is not very apparent until several years after infection takes place, so that pines may become severely infected before the disease is noticed. At the present time native pines are rapidly becoming diseased in the generally infected regions of New England and New York. The Federal Government is co-operating with a number of states in the control of the disease, and towns, associations, or individual pine owners can benefit in this co-operation and receive assistance in protecting their pines from the blister rust by writing to the Division of Pathology, United States Department of Agriculture.

"'Blessed is the man who has found his work.' This line has often recurred to me since taking up my work as artist for the government. In choosing a profession or trade one loves, it not only opens the door to many opportunities, but it is a joy each day. To be up-to-date I should say, 'Every day, in every way, I enjoy my work more and more.'"

From Bridge to Boilers of a Liner

Concluded from page 7

most convenient of three stations, it would not have been possible for me to realize what was going on, or just what such a situation means in extra work for the crew.

It is not often that passengers on a transatlantic liner have the opportunity of exchanging the top o' the morning with an unresponsive berg—not within two hundred feet of it anyhow—but that was my experience, and perhaps the most interesting of my seagoing experiences. A single iceberg brings a thrill—but many of them multiply the thrills.

Yet bergs and fogs are nothing, after all, and by midnight both were a memory. There was nothing to see from the bridge except water, a few gulls and a passing cloud. The northern lights that had graced the heavens the night before—another sight worth seeing—did not reveal themselves; atmospheric conditions prevented our seeing the restless beams of silvery light radiating from nowhere except an imaginary spot overhead, the radii lengthening or contracting every fraction of a second.

From top to bottom—so I descended into the engine room, duly chaperoned by an assistant engineer who explained to me the intricacies of oil-burning boilers. It is quite a change from the black, sooty, dank and damp entrails of a coal-burning ship, whose holds I have often visited. For one thing, the temperature is not so high and oppressive, the ventilation is much better and there is an air of cheer that must benefit those men who work twenty feet or more below the water line. One does not see men naked from the waist up, sweating and unsmiling and wan, obliged at short intervals to open furnace doors exhaling a deadly heat. It cheers the passenger to know that human beings are not obliged to work for his pleasure, under miserable and harrying conditions.

What I wondered was how a few riveted steel plates can withstand, for years, the terrific thrusts of the pistons turning the screw-shafts; thrusts that one feels, by standing near, could break through any masonry ever built. Seventy-three revolutions every minute, about two and a half million revolutions for each screw for the voyage. They are recorded. There are dials that tell everything, and even reading these intricate instruments is quite a science.

Just as men feel that they want to ride on the locomotive of a train, so there is ever any number of men, and a few women, too, who like to descend into the depths for a look around. One smells oil and steam and that tang of steel and iron that is peculiar of every place containing working machinery. Every handle and rod feels sticky but is not greasy; only the floors have a viscid feel that is quite treacherous, especially if the ship happens to roll a bit.

Back in the stern, where the huge shafts pass from sight through a bushing on the other side of which are the manganese bronze screws that do the work for which passengers mainly pay, that of forward motion, everything is silent. Salt water trickles inward, falls into a tank and is pumped out again. A mere light illuminates the long gallery as far as the first of a series of water-tight doors, and its lateral sides, painted white, remind one of catacombs, but the vibrations, slight as they are, and the occasional shaking whenever the huge rudder is moved a few degrees, soon awaken one to the fact that the place is alive—living the life created into it by man's ingenuity. Only if one thinks hard enough there comes a shiver, for at this point there are two plates between one's feet and the bottom of the sea, which might be twenty thousand feet deep—or of such a depth that one would not haggle long over a difference of a thousand feet or so.

But the men at work are unconcerned. They act as though they were in their homes fixing the gas range or tuning up their runabout. The water underneath is a cradle that holds the gigantic mass that houses so many hundreds of thousands of persons, and acts as a shock absorber—it is a veritable hydraulic absorber—of the pounding thrusts of the huge cylinders, to say nothing of countless other minor engines, pumps and the like.

What's in a Name? The World May Well Ask

A Bit of Frankness on an Angle of What We Please to Hold a "Problem"

By GUSTAVUS ADOLPHUS STEWARD

IT IS the last day of the month. You pay your water bill today or the water is shut off. The dingy temporary quarters of the Water Division in High street, into which quarters it was forced to move after fire destroyed the City Hall nearly two years ago, are besieged by "last minute" citizens. Every stopping street car adds two or three more to their number. They stretch in an inching-along, serpentine line from the cashier's window, down the entire length of the aisle between the gloomy "cages" of the sundry other officials, to the door and into the street. In this group of chronic postponers who have kept a faithful and hard-working city out of its money until the last possible moment am I. I am near the rear of the line and having come without my bill, I beckon to an attendant, hoping that he will get me a duplicate and save me from losing my place in line. No use. Politely he indicates a "cage," and I surrender my place.

At the "cage" a woman is ahead of me. She is matronly in appearance, dressed quietly, has a kindly face and a cheery smile. She, too, asks for a duplicate bill.

"What street and number?" inquires the official.

"No.—— Champion avenue."

"Why, that's changed to Hayes avenue now, ain't it?"

"I don't know—Champion's the name on the street sign."

"Oh, well, you know those folks down there where the governor lives changed the name to Governor Place and those up there where you live changed it to Hayes avenue—Hey Bill (to another official), ain't No.—— Champion avenue Hayes avenue now?"

Bill says "yes," and the first official continues:

"Wouldn't you prefer to have it Hayes avenue?"

"Well, yes (hesitatingly), for one reason I would."

"Certainly, I thought so."

I listen. They don't mention that reason. By some sort of occult thought transference, the mastery of which any medium would give her very soul to possess, each knows that reason. I, too, know what is in their minds, but it isn't a reason.

Still smiling, the lady gets her bill. I get mine and go to the end of the line.

* * * * * *

Champion avenue is one of the north and south streets of the city. Two east and west thoroughfares, about half a mile apart, cross it near its northern extremity. To the north of one of these its name is changed to Hayes avenue; to the south of the other it is changed to Governor Place. These changes leave a section of the street in between the two east and west thoroughfares still named Champion avenue.

I try to analyze the mental attitude that prompts, indeed, rather compels, the desire to change the name of a perfectly proper American city street the moment it extends itself north and south of a certain definitely delineated locality. Perhaps you can help me. But you will first have to see that portion of the street which causes its remainder to want to disclaim kinship with it. We will go early on a summer morning before the inhabitants are astir and before the traffic prevents an uninterrupted view, because the street reveals itself to best advantage at that time and season.

Here it is. Look at it. It is absolutely orthodox, just like a thousand others in a thousand American cities and towns. It is straight. It is regulation width. Its roadway is asphalted, its sidewalk cemented. The houses on both sides of it seem to be madly tumbling over each other in a clumsy race with the curb as goal. They are of the humbler sort, many needing paint, with here and there a feebly pretentious one, here and there an ancient shack. An occasional patch of green lawn, a red-capped climbing rose or blue-flamed hydrangea clinging for dear life to a decaying porch-post, attests an attempt at beauty, isolated and struggling, swallowed in the engulfing ugliness of the whole. Sundry blare-faced stores and equally obstrusive restaurants, a huge modern school building squatting broadly and possessively near a forsaken church, and the great white-columned edifice which supplanted the humbler place of worship complete the picture. There is no hint of architectural unity. As far as that is concerned equally attractive architectural jumbles have been almost achieved by freakish tornadoes. Practically treeless, the street's unrelieved ugliness is intensified by those tall wire-strung poles which are the despair both of city-planning idealists and telephone companies.

You have to admit that this section of the street "conforms." It is American. Even its name is American. You don't see anything wrong with the name "Champion." Indeed Champion is altogether a fitting name for an American street. It is indicative of so many qualities of that proud country which "can lick the whole creation." Yet something bothers you. Oh, yes, the people! Why, the people living here are colored.

You knew there was a reason, didn't you? And now you see the "reason" the lady at the Water Division office preferred to have another name for that part of the street where she lives. But, honestly, do you see a reason? The most unreasoning and unreasonable thing in the world is race prejudice. That is such a trite expression and so obviously true that one feels one's self to be on the mental level with an imbecile in inserting it here. Yet the crowning absurdity of race prejudice does not seem to make even the semblance of a dent on the American brain. Indeed, America rather triumphantly believes in that absurdity, in spite of the fact that it leads the believer into numerous and multifarious minor absurdities, such as changing the name of portions of a street merely because colored people live in another portion of it. That's here in Ohio. In other parts of the country which are less disingenuous on the subject of "race relations" it forbids "niggers and dogs" the use of the public parks, hauls "niggers and freight only" on the same elevator, segregates corpses on the basis of color in the public burial grounds, and performs other tricks, all more or less engaging. But let us return to the outlawed section of the street.

The larger number of the houses you see in this "undesirable" section are owned by white people and rented to blacks. And if you will look behind the houses facing the street, you will see in the alleys, euphemistically called "places," and in the open spaces masquerading as "courts," amid the ashes, garbage and mud, more and more of these houses, crowded as many to the square inch as possible, owned by white people and rented to blacks. See that man now leaving that unsightly, smelly place there which he calls home! If you ask him who owns his "home," he will tell you, "A rich widow on Blank avenue." Now if that man possessed all the Rockefeller millions, no price he might offer would rent a house for him on Blank avenue. More than that, if he should want to buy a house there, the rich widow would certainly form a Blank Avenue Protective Association to prevent him, although she knows already that she has the support in that laudable American aim of every building and loan company in the city. You don't believe that? Well, there's Mr. B. whose bank refused him a loan to buy a house near white people because it feared it might thus antagonize some of its customers, and who was frankly told by the building and loan companies to which he applied that it was not their policy to place loans where they would interfere with white neighborhoods. And there's Dr. Q. who succeeded in purchasing his house only by getting a pale-faced member of his race who could "pass" to negotiate the loan, causing the loan company to have several "sinking spells" when it discovered that after all it had made the loan to a colored person. And Mr. Z., a simon-pure white man, who couldn't induce the loan companies to take a mortgage on his house because thereby they would help him sell it to a colored man, and who consequently had to carry the mortgage himself. And there's Mr. X., whose pink-and-white clerk bought his home for him, whereupon the prominent downtown "realtor" who had the property listed immediately disclaimed any connection with its sale in an expensive advertisement in the daily papers. And, I almost forgot, there's that colored congregation which bought a corner lot for a new church. All the usual means were tried to stop the sale. The owner of the lot was waited on by the Protective Association, the loan companies were importuned, a prominent white churchgoer of the same denomination took the matter up deploringly with the local church officials, the church's New York office was advised, and although the congregation bought the lot, efforts still go forward to prevent erection of the church.

So you see that there is apparently a well-organized plan to force the colored man over there into that hut he calls home and then outlaw him because he lives there. In effect, he *has* to stay there. Now there are reasons, perfectly sound reasons, for making human beings stay in certain places. Criminals, insane persons, smallpox patients—these are with reason segregated and kept so. But the people who live in this "unwanted" section of Champion avenue are as a group neither criminal, insane nor diseased. *Their chief offense is that from humanity's grand primordial shuffle they emerged with black skins.* Nevertheless, they are practically kept there. And not only are they kept there, but their neighbors north and south change the name of the street so that by no possible chance will their place of residence be associated with that of those they keep thus hedged in. And if you'd ask these keepers the reason, they'd mutter something about "colored" or "niggers" with grunts of contempt, and that is just about all the light you'd get.

For after all there isn't any reasoning in that name-changing. The impulse to make the change is motivated by an absurdity so staggering that the most astute psycho-analysts will forever be baffled for an explanation that will really explain. Stigmatize a group who happen to live in a certain portion of a street. Change the name of that portion of the street where you live so that no faintest odor of the stigma will attach to you. Then move heaven and hell to prevent the group from leaving that portion of the street where they live. The *reason* for it? Echo answers.

A Little Journey

Concluded from page 2

assistance. Gold from a central reservoir would be pumped into the danger spot. That is why, in a previous article, I said that the Federal Reserve System provided a fire department for Wall Street. If all depositors in all banks demanded gold in exchange for their bank paper, the Federal Reserve System would be as impotent as a squirt gun in a great conflagration, because the bankers are permitted by law to sell their golden eggs to as many different customers, at the same time, as they are able, within a very generous limit, the Government promising to do what it can to see that the customers do not ask for delivery of the eggs.

England adopted the gold standard in 1816, and was followed by the other great nations in the following order:

Portugal, 1854; Germany, 1871; United States, 1873; Scandinavian countries, 1874; Holland, 1875; France and the Latin Union, 1876; Austria-Hungary, 1892; India, 1893; Japan, 1898; Russia, 1899.

At the outbreak of the Great War, all of Europe was tied to the single gold standard, and all of America, with the exception of a few minor Central and South American republics.

Gold being needed for monetary purposes in every industrial country of the world, there immediately set in a feverish competition for gold through rival exploitation of undeveloped countries, and it was this fierce warfare over export markets which more than any other one factor was responsible for bringing on the Great War, with the loss of more than 10,000,000 lives in battle, hundreds of millions more through famine and disease, and the wrecking of half the continent of Europe.

The adoption of the gold standard, far from being a progressive measure, was a reversion to barbarism, and its natural consequence was a barbarous war followed by a financial demoralization which is affecting nearly every country in the world today.

Patmos

Concluded from page 3

sometimes priceless Oriental rugs, and high-backed and hand-carved settees, that have been handed down from generation to generation. It is a treasure-ground for the seeker after rare Oriental rugs and furnishings, and the almost priceless quaint old oak chests, with traditional patterns carved on them.

The industries of the island are few—a little wine making until the grape vineyards became diseased, a not very flourishing trade in sponges, and fishing—these are the native Patmos industries. The women of Patmos are expert knitters and some trade in that industry comes their way. The island is not large, and boats ply along its shores, but there is no railroad and no interurban line to take people from place to place on the island. Horses are very scarce—probably not a half-dozen on the island, including the two waiting to be used as dowry, and unless one is willing to walk one stays at home or rides a flea-bitten donkey. As there are no roads, the donkeys are never harnessed, only ridden. There is no wheeled vehicle on Patmos, not even a wheelbarrow or a bicycle.

When one is invited to a meal at a native Patmos home, after he is seated, but before he has been served with food, either the host or the hostess will greet him delightfully with a little set speech—"You are welcome to our table, you are very welcome to sit down with us." And if you are well-bred, in Patmos, you will not hesitate to praise any article of food you have eaten at that table which has specially pleased you.

Marriage, birth and death—these three compass the cycle of life in Patmos as elsewhere. After a birth of a child a mother remains in her bed, according to Mr. Geil's book on home life in Patmos, for forty days, lest something dreadful happen to her.

When a man dies in Patmos, he is dressed fully, even to his hat, just as he dressed in life, and is laid in a bright rug which four men carry to one of the little private chapels, called "Little Monasteries," which every family owns.

A "Homey" Garden

Concluded from page 11

more in various parts of the garden. Here and there are scattered sturdy bushes of barberry mixed among which stand the quaintly tufted pennyroyal, clumps of sky-blue flowered toadflax, sea lavender and other reminders of the "home land."

Back of this triangular garden and along the woods where it dwindles away to the east into merely a row of poplars and a pussy willow thatch, runs a hidden path called pomegranate walk, so named because of a long hedge of pomegranates growing there.

Midway of the large open garden is the loveliest vista on the grounds. Wild purple asters from New England byways, tall-growing Michaelmas daisies (so named because they are supposed to be at their best on Michaelmas, which occurs September twenty-ninth), colonies of dainty yarrow with its feathery foliage, poke-root flowering and fruiting with a vigor far outdoing that of its "home folks," and massive clumps of day lilies grow in lush freedom in the foreground. Mullein builds up great, furry, gray leaf-towers to a height of seven and eight feet everywhere, and a single large yellow elderberry tree drops a contrasting color note in one quarter where grows every kind of mint. Here, too, are all those *enfants* of the eastern woods, such as the delicate primroses, the wild geranium or cranesbill, Soloman's seal, deerwood, green-bells and the exquisite meadowsweet.

Threading through a massed growth of the open garden one comes to the fence to view the meadow beyond from beneath the deep-drooping fringe of a great willow which joins hands with a row of Lombardy poplars and forms the eastern boundary of the gardens.

The grove begins here in the northeastern corner with a tangle of smoke-bush from Massachusetts, stiletto-thorned honey-locusts from Ohio, wild eastern persimmon, bamboo supplying support for yellow parilla, and sassafras trees growing in front of a splendidly towering slippery-elm, one of half a dozen in the grove and said to be the only ones in the West.

International Science Briefs

By **DR. ARVID REUTERDAHL**

President, Ramsey Institute of Technology, St. Paul, Minnesota.

The Origin and Motion of Planetary Systems

THE origin of the physical universe is a problem which is almost as old as thought itself. Leucippus (500 B. C.) developed the ideas of motion, vacuum and atom. He taught that all things are due to combinations of atoms, that their properties are due to the relative position and order of the atoms, and that ultimately all things cease to exist by virtue of the dissolution of their constituent atoms. Moreover, he held that the phenomena of nature were the necessary consequences of universal laws. Democritus extended the theory of Leucippus and foreshadowed the Newtonian principle of action and reaction.

The Brahmanists, Vedantists, and Buddhists developed theories concerning the origin of the universe. Dr. Robert T. Browne, in his great work, "The Mystery of Space," hints at this fact in the following statement: "During either a planetary, solar or cosmic period of gestation, the cosmic plasm is in a quiescent, undifferentiated condition. This undifferentiated plasm when acted upon by the will of the Creative Logos (God), *Fohat,* as He is sometimes called in Eastern Philosophies, begins to become conditioned, begins to differentiate."

This problem was discussed by the great thinkers of medieval times. It remained, however, for the great German philosopher Immanuel Kant to give definite form to these speculations in his "Allgemeine Naturgeschichte und Theorie des Himmels (1755). In this work, Kant first announced the, now famous, *nebular hypothesis.* At almost the same time the great Swedish thinker, Emanuel Swedenborg, independently announced a similar theory. It is interesting fact that Japanese scholars also considered this problem at about the same period. In the year 1793 the Japanese mathematician, Shizuki Tadao, developed a nebular theory concerning the origin of the universe.

Six years later Pierre Simon de Laplace, in his famous work, "Mécanique Céleste," presented a nebular hypothesis which has gone unchallenged until recent times. Laplace was sadly deficient in those high ideals which made Kant an outstanding figure for all times. In order to gain his ends Laplace never hesitated to use whatever means that would bring about the desired result. He conveniently shifted his political views as easily as a chameleon changes its colors. It is a lamentable fact that Laplace was convicted, by his contemporaries, of appropriating the ideas of other scientists without according them any recognition for their achievements. The plagiaristic mantle of Laplace is, at the present time, worn by the far more ambitious Einstein.

The theory of Laplace has been abandoned by modern scientists because it is inconsistent with facts. The same fate is already overtaking the theory of Einstein.

According to Laplace the life-history of our planetary system began with a nebula. He pictured this nebula as composed of a cloud of intensely heated incandescent gas rotating around a fixed axis. Due to the continuous action of gravitation the nebula acquired a form similar to that of a sphere or globe. He assumed that this mass contracted and that its velocity of rotation increased with the contraction. Later in the process a distinct polar flattening would be produced and *rings* of matter would be separated from the principal mass. The rings of Saturn suggested this phase of his theory. Finally the ring material would be concentrated into the form of a globe revolving about the central mass. In the theory of Laplace this process is supposed to account for the origin of planets. These, in turn, would cast off rings which later condensed into the well-known globular shapes of satellites.

That this hypothesis is little more than an unproved, haphazard statement which fails to provide those feasible mechanical elements which are demanded in an actual operation has been pointed out in part by Herbert Spencer, John Fiske, J. C. Kapteyn, C. A. Young and others. More recently the able American astronomer, George Henry Lepper, in his remarkable work, "From Nebula to Nebula" (Fifth Edition of 1920), has conclusively proved the entire futility of the Laplacian conception. That this extraordinary work of Lepper has not received the attention which it so richly deserves does not redound to the credit of modern science. The fearless critical attack of Lepper of the modern astronomical theories have never been fairly met. It is deplorable, indeed, that here again modern science stands convicted of a grave departure from the basic ideals upon which its very life and progress depends. Instead of jealously ignoring criticism of such import as that presented in Lepper's work it should be frankly considered, so that truth, the ideal goal of science, may be expeditiously found.

The hypothesis of Laplace consists of speculative premises artificially cemented together to produce the desired result. At the very outset Laplace postulates the incandescence of his nebula. More than twenty years ago Professor C. A. Young concluded that, "This postulate is more than questionable." In order to account for the intense heat of the sun, Laplace included ample heat in the nebula from which he evolved it as the remaining central mass of the planetary system. He did not even attempt to show how the primordial cosmic dust in the cold space of the universe could be brought into a condition of incandescence. Dr. Young and other eminent astronomers have pointed out the fact that to assume incandescence as an initially existing condition is a problematic and hazardous procedure. Laplace assumed rotation about a fixed axis as necessary to the formation of globular bodies and closed orbits. This premise also is purely artificial and was coined without reference to a productive cause, to produce the second result stated in his hypothesis.

Concerning this causeless rotation Lepper states, "Thus, they nonchalantly predicate the *spontaneous rotation* of the Laplacian nebula, though they would summarily classify as incurably defective a child of six who would expect as much of a mere squirrel-wheel." The trouble with the hypothesis of Laplace and all its modern variations is that *all except one of the premises are mere postulates.* The single exception is the premise that gravitation acts continuously. Observation has shown that this premise is a fact and not merely a conjecture. Laplace and his modern imitators have totally failed to assign an adequate cause for the rotation of the nebulous material around a common axis. Mere undirected gravitational influence between the cosmic dust particles cannot set up systematic rotation. These particles existing in space in that haphazard arrangement which we call chaos, of course, would feel, as it were, the mutual influence of the gravitational attraction but this cannot be regarded as a sufficient cause for the production of systematic rotary motion. Dr. Lepper's conclusions concerning this unfruitful supposition is pertinent. He states: "Such a view implies that *all* the circulating bodies in our system—comets, asteroids, meteor swarms, and even the dust particles in Saturn's rings derive their marvelously systematic motions from chance beginnings. To presuppose random, arbitrary motions is only to begin with a chaos worse confounded, and to render the task of Nature in the establishment of order all the more protracted and difficult." In fact, we may safely say that cosmos can never be produced from mere chaos.

As a preliminary step to the presentation of his own remarkably simple solution of this vexatious problem, Dr. Lepper shows that astronomers, since the days of Newton, have neglected, as he did, to apply consistently the universality of the Newtonian law of gravitation. When Newton analytically established the Keplerian Laws on a generalized mathematical basis he violated his own principle of universality and considered merely one central force (residing, as it were, in the sun) and one moving body. From this meager and merely partial data he developed the mathematical expressions which were intended to describe the orbital paths of the planets. The writer arrived at the same conclusions in the year 1904. We quote the following from Lepper: "When Newton conjured with that magical phrase, *universal gravitation,* he little realized how much more it meant than he construed it to mean. For he seems never to have thought of extending the principle to the stars, but inconsistently restricted it to the solar system, which we all know is little more than a molecule in the greater cosmos." (From Nebula to Nebula, page 32.) It may be of interest to compare this statement with the writer's, "Newton derived the Keplerian Laws by a complete abandonment of his own concept of universality." (Scientific Theism Versus Materialism, The Space-Time Potential, page 10.) The conclusion of Lepper is an independent confirmation of the views of the writer.

DR. J. G. A. GOEDHART,

Astronomer and officer of the Royal Netherlands Navy (retired), who concludes that the planetary orbits of Kepler and Newton must be replaced by spiral orbits.

Lepper finds his solution of the problem of rotation of both the nebulous particles and the finally evolved planets in the combined gravitational attraction of those celestial bodies which are located beyond the considered planetary system. He has given the name "Prime or Stellar Resultant" to this combined attraction. He conceives the origin of planetary systems in the following manner: Imagine first the existence of a formless cloud of cosmic dust attracted and moving under the gravitational influence of enormous quantities of stellar matter outside of its own boundaries. When the cloud moves because of this attractive force, Lepper speaks of it as being under the influence of the *Prime Resultant.* He postulates a creative edict as a first essential to galvanize the primordial chaos into ordered and gravitational motion. The nebulous cloud of matter in *falling* under the action of the *Prime Resultant* acquires a gyratory and vortical motion in much the same manner as the rotary motion which is given to water falling in a wash-bowl which is open at the bottom. It is a well-known fact that a body falling under the influence of gravity is accelerated, that is, its velocity is continuously increased. Consequently, Lepper reasons that the nebulous cloud will also be accelerated in its motion in the direction of the *Prime Resultant.* The inevitable result of this increase in velocity will be an acceleration in the gyratory motion. During this motion the nebulous matter which is nearest to the line of action of the *Prime Resultant* will gradually form into a globular mass in the manner of water falling as drops under the influence of the earth's attraction. Orbs of lesser size will be formed by the same process around the larger central mass. These orbs will rotate around the central mass in orbits which are merely vortical streams produced by the action of the *Prime Resultant.* According to Lepper the temperature of the central mass will increase with the increase in pressure which is inevitable under continuous gravitational compression. Herein he seeks the source of the sun's enormous heating capacity. The entire planetary system, which eventually assumes a lens-like form with the sun near the center, moves vortically along a spiral coil whose axis is the *Prime Resultant.* The type of this path is known mathematically as a *logarithmic spiral.* The writer in his work, "Scientific Theism," briefly discussed the importance of that cosmic factor which Lepper calls the "Prime Resultant." The following quotation is pertinent. "The inclination of the earth's axis to the plane of its orbit shows conclusively that a third activity factor influences the system." (Scientific Theism, page 158.) The writer's "third activity factor" is Lepper's "Prime Resultant." Lepper, however, developed the possibilities of his *Prime Resultant* and gave us a real genuine mechanical model for a spiral nebula and a physical cause for the spiral coil motion of our entire planetary system. This work of Lepper is epochal.

We are certainly living in an intense and highly interesting age. In America Dr. Lepper has developed the spiral orbit from the standpoint of his *Prime Resultant.* In The Netherlands, Dr. J. G. A. Goedhart, the astronomer, has evolved an elaborate exposition of his new discoveries concerning the laws of motion of the planets.

URBANA ILL

BRIEFLY TOLD

The largest alligator in captivity is thought to be several hundred years old. It weighs 1,400 pounds and is thirteen and a half feet in length. The age is determined by the width of the nose between the eyeteeth. After the reptile is ten feet long, the nose widens one-quarter of an inch for each fifty years the alligator lives. The average adult weighing about 1,000 pounds will yield approximately one and one-half gallons of alligator oil and a valuable hide, which, when tanned, weighs from thirty-five to forty pounds.

Magnus Johnson, recently elected Farmer-Labor Senator from Minnesota, made the following statement: "Sixty-five per cent of the wealth of this country is in the hands of two per cent of the population, and unless there is a better distribution of this wealth, the common people are going to revolt against it."

A prominent Paris daily paper, deploring the corruption of masculine styles and behavior by Americans in Paris, says that although Britishers in Paris "remain gentlemen, with waistcoats and yellow kids, many Frenchmen follow the lead of Americans who have left their vests in New York, their gloves in Washington, and arrive with naked hands and floating cravats."

Motor cars belonging to the King of England have no number plate. When His Majesty is on a ceremonial tour throughout his domain his car is distinguished by the royal standard badge which is fixed in front. This badge is superseded by a small blue light on the canopy above the chauffeur's head at night.

To keep the Central American Republics—Costa Rica, Guatemala, Honduras, Nicaragua, Panama, San Salvador—members of the League of Nations, reduced annual dues will be allowed them. Not one of these nations has paid its annual dues to the League since becoming a member. They claim their assessments are too high.

Prince Obolensky, a former millionaire cousin of the assassinated Czar of Russia, is commissioner of agriculture for all Russia and is successfully spreading the gospel of work in an effort to reconstruct that country. Farmers will carry on negotiations with the government on a basis of wheat instead of a gold basis. The commissioner believes that the coming wheat crop will provide at least 250,000,000 rubles' worth of wheat, and although Germany has tried to purchase the entire output, Moscow officials say they will hold out for higher bids from France and other nations.

The Roosevelt Newsboys' Association of Boston has started a movement to have every newsboy in the country contribute one cent to a collection of pennies to be melted down and made into a miniature reproduction of Laddie Boy, former President Harding's famous dog. The statuette is to be presented to Mrs. Harding.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The faithful in Turkey are now permitted to wear gold teeth, according to a decree published by the Angora Minister of Religious Affairs. The law of Mohammed forbids the carrying of any luxurious ornament except a silver ring, the value of which must not exceed that of a winding sheet. At the time of Mohammed the prices of these two articles were practically identical.

Each year Americans drink 4,000,000,000 bottles of soft drinks, exclusive of such beverages as near-beers made of cereals.

A competition among dye-makers is to be held in an effort to produce khaki cloth that will not fade. The dyes will be applied to khaki cloth, the cloth made into uniforms, and the uniforms worn two months in the tropics. The dye that best holds its olive drab will be used exclusively by the army in the future.

The largest artificial lake in Europe is located on the island of Sardinia. A hydroelectric development has recently been completed on the Tirso River, near Oristano, in which 420,000,000 cubic meters of water have been impounded; and this is but the first of a series of seven artificial reservoirs included in this project. The water will be used for irrigation and power and will give permanent employment to more than 200,000 people.

Chicago is only twenty-eight per cent "American" in the strictest sense of the word. The statistics collected by the Chicago association of commerce show that seventy-two per cent of the population, or 1,947,376 persons, are of foreign birth or parentage. The Federal census classes all persons born in this country as Americans, but the association of commerce made a finer distinction. Less than twenty-five per cent of the white population of Chicago are "Americans," as classed by the association of commerce.

An acre burial plot near Lancaster, Ohio, was bequeathed by Nathaniel Wilson 100 years ago to President Andrew Jackson as a burial place and to his successors in the Presidency. No Chief Executive has ever availed himself of the privilege, however. The donor died in 1836. Locust trees are within the inclosure and it is surrounded by a high, octagonal stone wall. The place is known locally as the "President's Acre."

France is developing cotton production under her own flag. Several new plantations have been opened this year in Algiers and a net profit of 3,500 francs a hectare is reported from this crop. In the French Sudan, cotton equal to the best Egyptian has already been raised.

A special waterproof deck of cards is used by bathers in the North and Baltic seaside resorts, who play on floating tables while in the water. So obsessed with the gambling fever are they that they play roulette, baccarat, seven-up and other games of chance at all times, with the bets running into millions of marks.

Calvin Coolidge, Jr., son of the President, is picking tobacco for the firm of Dickerman and Day in Hatfield, Massachusetts, for $3 a day. He rides a bicycle to and from work. Surely this indicates true democracy.

A race of Lilliputians, scarcely four and a half feet tall, live on the Adnaman Islands in the Bay of Bengal. In fishing they do not use hook and line but shoot the fish, the bowman balancing on the prow of his canoe and then following the arrow after the fish is struck. The canoes are hewn with stone tools from single logs and are very thin.

"If you had to pay the farm wife a salary based on her actual worth, she could command at least $3,800 a year, as seamstress, laundress, cook, nurse, assistant hired man, general manager and several other tasks," declares Professor Ruby Green Smith of Cornell.

The late President Harding's tomb will be guarded by a detachment of regular army troops for six months, as required by law, and perhaps longer. Regular troops were on duty about the tomb of President McKinley for nearly two years to prevent souvenir hunters and other vandals from disturbing the sleep of the dead.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

9-15-23

THE DEARBORN PUBLISHING CO.

Are the Jews "God's Chosen People"?

An Untenable Position Examined and a Stumblingblock Removed; The Claim That Judah Is Israel Shown to Be False

A PERVADING superstition of the Christian church, a superstition fostered through the centuries, is that the Jews are "God's Chosen People." The term superstition is applied to this belief because it rests on no authority that any division of the Christian church recognizes.

The Bible in its larger part is a racial book. It contains, among other things, the doctrine of a Chosen People, a select seed, an elect race. Other races were to exist and flourish and reach the fullness of their destiny, but the tutor race of them all was to be the guide and master of them all. The doctrine of racial superiority is undoubtedly included in the Bible.

But misreading the Biblical statements wherein that doctrine is set forth, both Jew and Christian have gone astray—the Jew claiming that he is the Bible's destined master of the world, some Christian sects vociferously confirming the claim, while all Christian sects give more or less credence to it. Every Sunday school child, in British and American Christendom at least, hears sooner or later that the Jews are "the Chosen People" and that all the great and good characters in the Scriptures are Jews. Clergymen for the most part always assume these things and often teach them.

It is the purpose of this article to show—taking the Bible as the recognized Scriptures of Christendom—that in them is no ground for harboring this superstition concerning the Jews. This article does not even propose that the Bible is a sacred Book. The purpose here is not doctrinal nor religious. Simply taking the Book as it is, in the hands of Christian or Jew, the proposal is to show that the superstition is not taught in it.

The Choosing of the Chosen People

THE story of the Chosen People as told in the Bible begins with Abraham, who was not a Jew, whose family had come from Armenia to dwell in Babylonia, and who was later called out of the idolatry surrounding him in Babylonia and bid to travel. As he went there came to him a gradual unfolding of promise and prophecy and a sense of the One God Jehovah, the record of which has to this day affected the world's thought. The promise was unqualified and the prophecy attested, that Abraham should become the father of a great people in whom all the families or nations of the earth should be blessed. His descendants should be as the sands of the sea. He should be a father of nations. The ruling race should spring from him. This promise was *unconditional* and *everlasting*. Through Abraham's son Isaac, and through Isaac's son Jacob, the promise was mystically repeated and each time expanded.

It is worth a word in passing that this race superiority was predicated only on ability to serve the rest of the nations. The superior race is considered superior only in what it can do *for* the other races—not what it can *do them for,* to use a common expression. "In thee shall all the nations be *blessed"* is the constant refrain, and if the word "blessed" were liberated from its artificial ecclesiastical and religious meaning it would become a very big and everyday word.

Now Jacob had twelve sons by four mothers—and as yet no Jews appear in the record. The name Israel, however, appears in the record about this time, Jacob having changed his name to Israel. The "children of Israel" are the twelve sons of Israel, one of these sons bearing the name of Judah. These twelve sons were reckoned as heads of the Twelve Tribes of Israel. As a matter of fact there were *thirteen* tribes, in consequence of Israel appointing two of his grandsons—Joseph's children—each to head a tribe.

Judah a Lesser Figure Than Joseph

AT THE close of Jacob-Israel's life he said to his sons: "Gather yourselves together that I may tell you that which shall befall you in the last days." Thereupon he began to pronounce upon each a prophetic destiny. They are all found in Genesis, forty-ninth chapter. Judah's destiny is found in verses eight to twelve. Compared with Joseph's destiny, Judah's is secondary. Upon the head of the Joseph tribes were pronounced splendid forecasts of strength, power and rich dominion. Joseph's destiny is found in verses twenty-two to twenty-seven. The interested reader will compare the two.

The history of the "people of Israel" goes forward from that point with distinct tribal differences. From the beginning the Joseph tribes—Ephraim and Manasseh—take the lead. And the tribal names are distinct. A man of the tribe of Benjamin is a Benjaminite. A man from the tribe of Simeon is a Simeonite. A man from the tribe of Judah is a Judahite. By this time the tribal names of Israel traced back to five mothers, since the mother of Joseph's sons was an Egyptian, daughter of an Egyptian priest. It is a rather strange twist to the story that Joseph, who was lost to his family as a boy, who won high place in the Egyptian government and married an Egyptian wife, should be given the high place over his brethren—even over Judah whom Christians say is the "chosen" one—and should have been promised that high place over them forever. This, however, is the way the record reads.

Pass over a long period to the time of Moses—who was not from the tribe of Judah but from the tribe of Levi. Moses stands before the world as the Lawgiver who reduced social morality to a code which still stands. At the end of his long career he called the tribes together again to pronounce upon them, as Jacob-Israel had done, their prophetic destinies. It is recorded in chapter thirty-three of Deuteronomy. However regarded, it is a noble utterance: "When the Most High divided to the nations their inheritance, when he distributed the sons of Adam, he set the bounds of the people according to the number of the children of Israel." (Deut. 32:8) And then he repeats the destinies of the tribes.

Judah's destiny has changed, apparently. Moses said, "And this is the blessing of Judah: and he said, Hear, Lord, the voice of Judah, and bring him unto his people. Let his hands be sufficient for him; and be thou an help to him from his enemies."

Compared with Jacob-Israel's words to Judah, this is a very notable change. The note of *separation* is strangely present. A definite note that Judah must return to Israel, not Israel to Judah, is clearly present. Obviously this is not the Chosen People. This is a people needing help. This people is not a leader: this people is a stray.

"And of Joseph he said, Blessed of the Lord be his land, for the precious things of heaven, for the dew, and for the deep that coucheth beneath, and for the precious fruits brought forth by the sun, and for the precious things put forth by the moon, and for the chief things of the ancient mountains, and for the precious things of the lasting hills, and for the precious things of the earth and fullness thereof, and for the good will of him that dwelt in the bush; let the blessing come upon the head of Joseph and upon the top of the head of him that was separated from his brethren. His glory is like the firstling of his bullock, and his horns are like the horns of unicorns; with them he shall push the people together to the ends of the earth; and they are the ten thousands of Ephraim and they are the thousands of Manasseh." (Deut. 33:12-17)

There is quite a difference in these destinies. There is no need of help here. The reference to the Joseph tribes' power to push the people to the ends of the earth recalls the Jacob-Israel prophecy that Ephraim should become a "multitude of nations," and Manasseh "a great people." Ephraim and Manasseh were the Joseph tribes. These prophecies were never made of Judah. The interested student should carefully compare the destiny pronounced upon Judah with that pronounced upon the Joseph tribes of Ephraim and Manasseh.

Judah the Deserted Prussia of Israel

THE next event noted along this line of inquiry is *the secession of Israel from Judah.* From the beginning Judah had been separated, in a sense, from Israel. During the period of the Judges, Judah contributed but one ruler. The great Deborah was of Ephraim; Gideon was from Manasseh; Samson was from Dan. None of these was a Jew in the tribal sense. Samuel, the great link between the Judges and the Kings, was of Ephraim. Saul, the first king of Israel, was from the tribe of Benjamin. Then followed the reigns of David and Solomon, during which Judah appeared separate in the census. It was upon the death of Solomon that Israel seceded—the ten northern tribes refusing to live longer with the Judean tribe. The separation had been brewing for a long time. It occurred after several attempts at revolution. The two sections had always been recognized as separate, as any one can see, in the constant recurrence of the phrases "Israel *AND* Judah." "Go number Israel *AND* Judah." "In Hebron he reigned over Judah seven years and six months: and in Jerusalem he reigned thirty and three years over all Israel *AND* Judah." So that it is apparent that Israel, ruled by the highly destined House of Joseph, had always been thought of, and by the chroniclers spoken of, as somehow separate.

When the final separation and secession came, one tribe which belonged to Israel was left with Judah. This was the tribe of Benjamin which at first, it appears, went with Israel but afterward went back with Judah. The reasons for this return may have been that Jerusalem was in Benjamin's territory (which may again shock those who think that Jerusalem was a Judah city); but the reason given in the Bible is this, that the Benjamin tribe was left for the city's sake "that David my servant may have a light alway before me in Jerusalem." (See 1 Kings 11:32 and 36.) This "lamp tribe" is the tribe of Benjamin. But its choice does not enhance the claim that the Jews are the Chosen People. Why should "the Chosen People" need a tribe from Israel to keep a "light" in Jerusalem?

It may be worth noting at this point that, some centuries later, from this tribe of Benjamin came the great Christian Apostle, St. Paul. Paul was not a Jew, except as in his time the religion was known as the Jews' religion and the adherents to it were known as Jews. Paul's pedigree is this: by race a Hebrew; by nationality an Israelite; by tribe a Benjaminite; by religion a Jew; by denomination a Pharisee; by citizenship a Roman; by conversion a Christian; and by calling, an Apostle. Esther, who is so often spoken of as a "Jewess," was only so as a religionist. She was a woman of Benjamin.

That is the history up to the time of the secession of Israel from Judah. They lived apart as separate nations. They were clearly headed for different destinies. Israel's destiny, as pronounced upon the tribes that formed the House of Israel, contained all the promises of world power and world service. Israel's destiny required her to go out into the world and realize it. Judah's destiny did not. Judah's destiny is to be fulfilled, according to the word of Moses, when Judah is joined to Israel, not as the dominant people but as the sharer in what Israel has won. Israel in her tribes retains the dominance. But Israel has always been good to Judah, even while telling Judah the truth—the truth that hurt. Israel's prophets in the Scriptures have always done that.

While the two Houses lived apart, the Prophets arose—most of them in Israel. Children in the Sunday schools as well as clergymen in the pulpits continue to talk of all Biblical characters as Jews, whereas very few were. Of the prophets, Samuel, Elijah and Elisha, Jeremiah, Hosea, Micah and perhaps Amos were prophets of Israel. The last of these, Jeremiah, saw the downfall of Judah, and curious indications exist that he did not remain with the fallen House of Judah but may have regained Israel who by that time was also out of the land. At any rate, seldom is a Jew named "Jerry."

Up to the time of the prophets, however, there was no indication that being "the Chosen People" amounted to anything. The prizes of world power and wealth were going to the great heathen empires then forming. Certainly the fortunes of both Judah and Israel were dolorous enough to arouse doubt as to either ever attaining a place in the sun. Israel had gone out of the land, some of the tribes probably by sea (for Israel had a far-reaching commerce, as a study of "the geography of tin" indicates; and the most wonderful thing in the book of Jonah is not the "whale" but the fact that the recalcitrant prophet could go down to the coast and pay his fare in a ship sailing for a port that might have been as far as Spain!) and some by land, to disappear to the northeast, toward the gateway through the mountains to Europe—leaving the House of Judah alone in Southern Judea.

Bible Never Confuses Israel and Judah

THIS event seriously shook even Judah's faith in the idea that they were "the chosen people." The eighty-ninth Psalm is a direct charge to Jehovah that He had broken His word: reciting the covenant, this Psalm begins at the thirty-eighth verse to recite the indictment against Jehovah. It is a remarkable passage. In Jeremiah 33:24 there is another proof that "people were talking." It was impossible that so vital a national ideal, founded on religious faith and promise and prophecy, should disappear and not cause comment. So, before Israel went out of the land, the Prophets continued to hold up before her the destiny that confronted her, notably the Prophets Hosea, Amos and Micah directly to the people's faces. In Judea the Prophets Isaiah and Jeremiah take up the strain, all making the sharpest distinction between the House of Judah and the House of Israel, but all declaring Israel's greatness and Judah's comfort when Judah should "walk to Israel."

It would seem that the major error has been in neglecting this distinction between the two Houses. All the Bible writers are scrupulously careful in distinguishing between Judah and Israel. To cite a few instances:

"And the men of *Israel* answered the men of *Judah* . . . .And the words of the men of *Judah* were fiercer than the words of the men of Israel."

"To your tents, O Israel," was Israel's war cry of cleavage from Judah.

"Go number Israel *and* Judah . . . . And there were in *Israel* eight hundred thousand valiant men; and the men of *Judah* were five hundred thousand men."

"And made Jeroboam king over all *Israel;* there was none that followed the house of David but the tribe of *Judah* only."

"And the king of *Israel* went up against *Judah."*

"And *Judah* was put to the worse before Israel, and they fled every man to his tent."

"Ephraim (Israel) shall not envy *Judah,* and *Judah* shall not vex *Ephraim* (Israel.)"

"And the Lord said unto me, The *backsliding Israel* hath justified herself more than the *treacherous Judah."*

"In those days the *House of Judah* shall walk with (to) the *House of Israel."*

"Then I cut asunder my other staff, even Bands, that I might break the brotherhood between *Judah* and *Israel."*

The "Chosen People" Are Not the Jews

NO BIBLE writer ever intimates in the slightest degree that the Jews comprise Israel. No Bible writer ever intimates in the slightest degree that Judah is "the Chosen People."

This does not weaken the fact that *"the Chosen People" idea* is strongly present in the Bible, *but the Chosen People are not the Jews.* Take the Israel tribes that seceded from Judah, attach to each the prophetic destiny assigned to it, and it is absolutely clear that the tribes which seceded from Judah went out into the world bearing all the prophecies of dominance with them. If the prophetic destiny of the Jews is to be emphasized in the churches, the prophetic destinies of Israel ought also to be emphasized.

There is, on a Biblical basis, no reason to say that Israel is "lost." The "lost ten tribes" is an expression that bears all the earmarks of a Jewish invention. In a sense Judah is more "lost" than is Israel in that Judah is mixed with a multitude that is neither Semitic nor Hebrew. Those who conceive that the common type of modern Jew is a descendant of those who lived in Palestine are seriously mistaken. The Tartar Jew from Russia and the Slavic Jew from Poland may be a

(Concluded on page 10)

King's Chapel Crams History Within Walls

Governors and Loyalists Worshiped in Church Founded by Order of Charles II

By MAY B. WHITING

King's Chapel, showing the ancient pulpit.

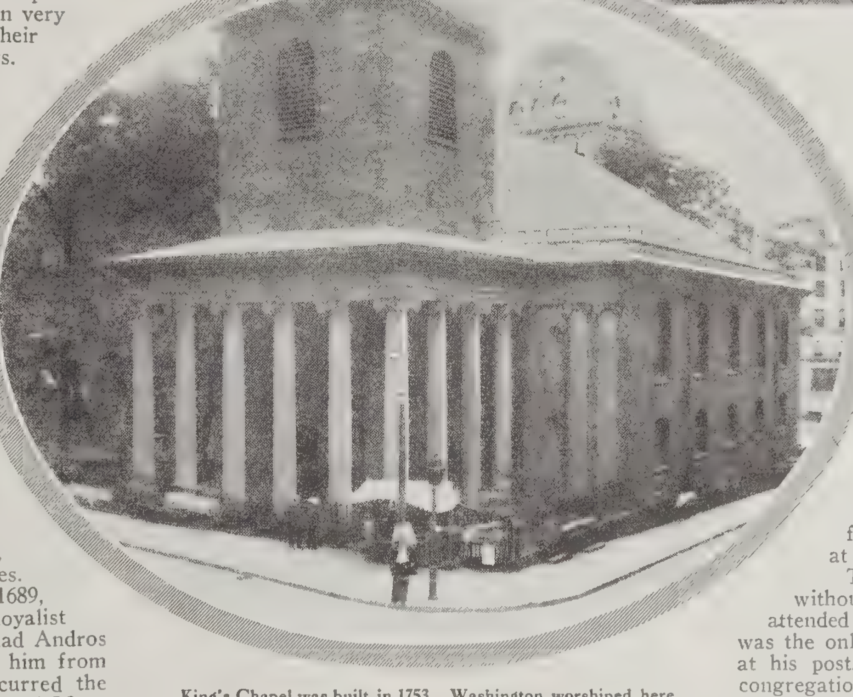
ON ONE of the busiest corners of old Tremont street, Boston, King's Chapel rears its solid structure, low, dull and gray, its porch somber with long memories of the past and of the strange and varied events of which it has been a part. Soberly, with just a touch of gloom, it faces the passing crowd, as if wondering whether they have forgotten that its foundations are on land wrested from the adjoining burial ground and that beneath its nave sleep scores of worthy Puritans who, in life, would have stormed against its building. Perhaps, when the pale moonlight slides beneath the columns, their ghosts assemble in the dark recesses to discuss their ancient wrongs.

When Charles II annulled the charter of the Massachusetts Bay Colony, he determined to establish the Church of England among them and, in 1686, he sent over the Rev. Robert Ratcliffe for the purpose. But Mr. Ratcliffe found himself about as popular in Boston as a kitten's paw in a bowl of goldfish. The king's agent, Randolph, fumed and stormed, and threatened to make the three churches in Boston give a grant for his support. He even talked of confiscating the funds laid by for the conversion of the Indians, "a great bank of money," but confessed that he had already made so many enemies he did not dare.

But when Governor Andros arrived in December he let no scruples stand in his way. The very day of his landing he called the three ministers together and asked them to decide which one should give up his church for the new society. But, as Judge Sewall says, they "thoroughly discoursed His Excellency about the meetinghouses in great plainness showing that they could not consent," so that Mr. Ratcliffe held his services in the "library room" of the Town House which stood on the site of the Old State House.

Before long his congregation outgrew their narrow quarters and this time Governor Andros sent for the keys of the Old South. But a committee of prominent laymen waited upon him and told him in very emphatic language that the property was their own and that they proposed to hold the keys. For two months more the governor held his peace; then, by intimidation or bribery, he secured the keys from the sexton, and on Good Friday the bell was tolled and Mr. Ratcliffe read the service in the presence of the governor and his followers. They continued to occupy the church for two years, with little regard for the comfort or convenience of its rightful owners.

During this time the new society was accumulating enough money to build a church for themselves, but the question was to find a lot. No one who owned land suitable would sell, for Boston did not take kindly to the surpliced priest with his "box of whistles" to help out the singing, and the saints' days, especially that of the "holy martyr, Charles I." At last, Andros, thoroughly exasperated, seized a corner of the burying ground, and, while the ministers thundered vainly against it, King's Chapel was erected, graves or no graves.



King's Chapel was built in 1753. Washington worshiped here on his first visit to Boston.

The first service was held on June 20, 1689, and here, for many years, the governors and loyalist families of Boston worshiped. But scarcely had Andros accomplished his purpose when fate removed him from the enjoyment of it. In a few months occurred the revolution in England which placed William and Mary on the throne, and the people of the Bay Colony, rising in insurrection, put Andros, Randolph, and Ratcliffe in the prison on Fort Hill where later the witches, Quakers and Captain Kidd were held. Later they were sent to England by royal command, and Boston counted herself well rid of them.

King's Chapel was fortunate in her second minister, the Rev. Samuel Myles, an American by birth and a graduate of Harvard College. He was most successful in getting support in England for the new church, and on his return from a visit, he brought with him gifts of altar furnishings, carpets, communion silver, and a yearly grant of money. Later William and Mary sent over a theological library. This was scattered during the Revolution, but the remaining books were given to the Boston Athenaeum, where they now remain, almost as fresh as when they first arrived. Apparently no one has ever read them and it is not likely that any one ever will.

In the days of Mr. Myles' ministry King's Chapel presented a very gay appearance. Its pillars and walls were decked with the escutcheons of the king and of knights and baronets connected with the province, and at the east end was the "altar piece, whereon was the Glory painted, the Ten Commandments, the Lord's Prayer, the Creed, and some texts of Scripture." The governor's pew was raised a few steps and hung with crimson curtains surmounted by the crown. Nor was the audience out of keeping with this splendor, for the governor and royal party wore full court dress. It must have been a sharp contrast to the sober orthodox meetinghouses with their dark-clad congregations, and no doubt the Puritan youth peered curiously and a bit enviously in at the door, especially when the church was gay with the wreaths and candles of Christmas.

Until 1713 there was no organ in Boston. Then Thomas Brattle, the treasurer of Harvard, imported one from England, and at his death left it to the church in Brattle Square, provided they would accept it. But the church voted, "with respect," that they did not deem it proper to use an organ in the public service of God, and so, by the terms of the will, the instrument came to King's Chapel, who received it thankfully.

Before long the church in the New World began to show signs of that independence which the royal governors complained was in the very air. When it became necessary to choose a successor to Mr. Myles, instead of leaving the matter with the Bishop of London, they selected on their own account a Mr. Price, usually called Mr. Commissary Price, because he held a commission to have general oversight of Episcopal churches in the provinces. His induction to office was by a curious ceremony. All the people went out of the church, after handing over the keys. Then Mr. Price proceeded to lock himself in and toll the bell, after which he opened the doors and the congregation wished him joy on having possession. Just how much joy he had is a question, for his pastorate was a stormy one. Once he was disciplined and finally he resigned and his resignation was accepted.

Mr. Caner succeeded Mr. Price and he at once set about the task of building a new church, for, in spite of the fact that they had sent off two branches, Christ Church and Trinity, the congregation had quite outgrown their modest structure, already once enlarged. As before, the chief difficulty was to get land. Just back of them was the public Latin School, and, so keen a bargain did the Town Fathers drive with them, that they were obliged to rebuild the structure in brick on Bromfield street.

But funds for the new church were by no means lacking. Governor Shirley, Peter Faneuil, and Sir Harry Franklin headed the subscription in Boston, and numerous gifts poured in from England. Yet not all the friends of the established church were disposed to be generous. One English dignitary, remembering, perhaps, their independence, said that "if the twelve apostles were to apply to him in behalf of it, he would persist in refusing to do it."

On August 11, 1749, Governor Shirley laid the corner stone. The edifice was built of the dark surface granite from Quincy, for there were then no means of quarrying it, and it was hauled to Boston in ox carts. George III was greatly interested in the new church and sent a handsome gift of communion silver. In 1756 a new organ, with miter and crown for ornaments, came from England, selected probably by the musician Handel who was a great friend of His Majesty.

During the Revolution, General Gage, Sir William Howe and their suite worshiped in King's Chapel, but of the Boston members of the congregation, the majority were patriots. The night of the evacuation, Dr. Caner, then an old man, with eighteen other Episcopal clergymen and several loyalist families, sailed for Halifax with the fleet. Dr. Caner took with him the vestments, record books, and silver of the church. The books were in large measure recovered, but no trace was found of the plate, which was probably distributed among other churches. Less than a month after the evacuation, the church was opened for the funeral of General Joseph Warren who fell at Bunker Hill.

The congregation of King's Chapel, left without means of holding services of their own, attended Trinity, whose young minister, Mr. Parker, was the only one of the faith in Boston who remained at his post. Their own building they offered to the congregation of the Old South, whose church had been so abused by the British, who used it as a riding school, that it was unfit for occupancy. For several years members of the Old South worshiped in King's Chapel, thus squaring, in a way, the old account.

In the meantime the vestrymen were laying plans to resume their own services. Dr. Thomas Bulfinch, father of the architect, was senior warden, and, when they returned to their own building, he appointed as "reader" Mr. James Freeman, a young man who had preached a few times but who had never been ordained. Mr. Freeman was a man of independent thought, and before long he sorrowfully told his congregation that he must withdraw as he could no longer subscribe to the views of the Trinity. Instead of accepting his resignation they requested him to preach a series of sermons in which he explained his ideas. The result was that they rewrote the liturgy, and thus this first Episcopal church in the New World became the first Unitarian.

At that time King's Chapel had no intention of separating from the other Episcopal churches. But when Mr. Freeman wished to be ordained there was no bishop who would perform the ceremony, so the church ordained him themselves. This peculiar strain of independence still persists. Although Unitarian, a part of the English service is read, its ministers wear the garb of the Episcopal clergymen of two hundred years ago, and some of the ceremonies of that date are followed.

The present edifice still preserves many memorials and mural tablets of the original wooden structure. For lack of room, when the new church was erected, it was built around the old one, in which services were held during the five years it took to get the stone together and complete the building. In that way the pulpit and

The Shame of Ellis Island

THE British ambassador to the United States had a right to report to his government the conditions prevailing at Ellis Island, and is still within his rights even if his report be regarded as a protest. It is shameful in the extreme that respectable artisans and their families should be herded with the filthy and vermin-infested aliens from Eastern Europe who are flocking here to the prevention of a better stock. Our reception of immigrants is such that only those lost to all self-respect would undergo the indignities necessary to arrival in this country.

It is significant that Ambassador Geddes finds that provisions made for the Jews are perfect and that special arrangements were in force to meet every Jewish scruple. He did not find that the same regard was given the sensibilities of people who were usually higher in the social scale. His report does not make good reading and it may be believed that only the most urgent reasons operated to have him make a report at all. These reasons are such as no American administration can afford to disregard. The publication in this country of the British *White Paper* containing the report will be sufficient to cause indignation among citizens of English, Scotch, Irish and Welsh descent, and, unlike most indignations engendered among racial groups in this country, it would be amply justified. Ambassador Geddes himself with difficulty conceals his personal indignation with the spectacle he witnessed at Ellis Island. He says that it was thirty-six hours before the odors of the place ceased to taint everything he ate or drank. The arrangements for personal examinations border on indecency and one wonders how the Immigration Service personnel endures it day by day, until one reflects how large a part of that personnel is not American.

Among the proposals which the ambassador makes is one which would leave the present Ellis Island to be the "kosher station," that is, the place for the reception of Jewish immigrants, while another station be provided for the rest.

This is putting it pretty plain, yet there are people in the United States who say that consciousness of the Jewish Question here is due to "prejudice."

The Earthquake and Consequences

FOR more than ten years there has been a growing feeling among serious-minded people that we are in a period of upheaval and catastrophe. The indifference that preceded the World War has passed off the minds of the people. A sense of being at the end of systems is clearly shown in almost every quarter. Perhaps it was this which made possible the strange unanimity with which both Japanese and the rest of the world regarded the great earthquake as in a manner providential. The Japanese said it was a good thing for Japan because the only method by which the Island Empire could be compelled into the main channel of progress was to have her old ways ruthlessly shaken to pieces. This view was one of the earliest given to the world and represented a certain clarity of vision which would have been refreshing had not the accompaniment been so unutterably tragic. The world itself saw in the terrible occurrence the sudden death of the Japanese War Scare which certain interests had so sedulously cultivated of recent years. Curiously enough, this view generally depends upon the supposition that the Japanese War Scare is dead because, forsooth, the earthquake has clipped Japan's power and resources. That, however, is not the view we take. The Scare is dead—with that we agree; the Scare that Japan was about to attack the United States, we mean. But it is altogether possible that the earthquake, in its consequences, may promote Japan to the higher national grade in fewer years than unbroken continuity of her old life could have done. Japan is left in a position to inaugurate immediately reforms which would have been impossible for decades under the old conditions. This will mean, probably, an increase in military and naval efficiency. But even this fact is not to be received as a menace, for it is pretty certain in the coming struggle Japan will be on the side of the forces of civilization and an ally of that other Island Empire at the western extremity of the great eastern continent.

"The Tariff Is a Joke"

SIR STANLEY BALDWIN, the English premier, in an address at a dinner in his honor given by the Lord Mayor of London, told the assembled guests, included among whom were statesmen and business men of world renown:

> "Credit alone can not restore the trade of the world, can not alone give us that export trade we need. For export trade, no less than for the home trade, whatever financial devices may be arranged and secured, all trade comes down in the end to there being a man in some country in the world who will buy what we make and, having bought it, can pay for it. What we are suffering from is the devastation caused by the war that, for one reason or another, none of the belligerent nations has been able yet to tread in that same stern path of rigid economy and self-control—the taxation of the people—that we have trodden in for the last five years."

There is food for reflection in that statement for every citizen in the United States. The fact that there must be found somewhere a buyer for what we have to sell brings to mind the fact that the buyer, if found, must dispose of his own work to purchase ours. The tariff ceases to be a joke to him or us, for in creating it we notify him that ours is a "cash and carry" shop. He wants our wheat, for instance, but hasn't the cash, so takes his wares to another market, where, perchance, he meets a customer who has wheat to sell. Is it reasonable to imagine he will demand the cash and bring it for our grain or will he exchange his goods for the wheat he wants?

Mr. Baldwin was able to illustrate his second point, as to economy, by pointing to the reduction of public appropriations to less than half since the Armistice. Instead of a budget of $10,000,000,000 a year, it is now but $4,000,000,000.

Of all nations, the United States should lead in the matter of economy. That we have not is a matter for serious consideration. The taxes are burdensome and the benefits of government are not proportionate, nor are the assigned causes of the taxation convincing.

Can't Go On Forever

THE other day a man received a little booklet from a bank, showing, through the operation of compound interest, how much money he would have at the end of twenty years, by depositing a certain small amount every month.

If we became a nation of "savers" and all our money were placed at interest, within a few years our "savings" at compound interest would amount to a staggering sum. The fallacy of the "thrift" propaganda should be evident in the fact that every dollar saved by one man must be spent by another, or there could be no interest. Therefore, the more money placed out at interest, the less money there will be with which to pay interest.

The total production of gold in the United States in the year 1921 amounted to $49,105,000. In the same year the outstanding debt of New York City alone totaled in the neighborhood of $1,800,000,000—nearly two billions—the interest on which at five per cent would amount to some $90,000,000 annually.

At the rate at which interest-bearing bonds are now being issued, it is calculated that within a comparatively short time the entire annual income of the nation will be absorbed in interest charges.

When that point is reached, there can be no more "saving" because no more interest can be paid, and so no one can borrow. But as compound interest works night and day, the interest charge will then *begin* to *exceed* the annual income of the country. With no more borrowers, how will the banks meet the accumulating "interest" of their depositors? That is a question which no financier has as yet answered.

The truth is that the Gold Standard and the interest system which is bound up with it lead directly to bankruptcy.

Leading the World in Crime

RECENTLY at a play a sensational episode was presented on the stage, involving a display of pistols and rage. The spectators looked, of course, for the usual shooting and murder to follow but instead were treated to an unintended lesson in the restraint which the law holds over the criminally minded. Reminders of the Law interposed to foil the crime.

As the humorous paragraphers would say, "find the error in that sentence." But there is no error. It actually occurred. The explanatory fact is that the play was a British play and was true to fact in Britain. An American-made play could never have survived such an anti-climax.

There are twenty times as many murders in New York City every year than in all England, Scotland and Wales. There are ten times as many murders in Chicago every year as in all France.

What is the reason? One reason, no doubt, is the polyglot population, but at best it is only a secondary reason. The principal reason is the political aspect of American justice. In a recent Boston campaign the writer heard all sorts of candidates, from Congressmen down, base their pleas for election or reelection on their record for getting accused men out of the toils of the police or free in the courts. Just as there are industries that claim special tariff protection, and support the officials who secure that protection, so the crime industry of the United States looks to politics generally for protection. The only people who ever talk about having "influence" in official circles are those whose misdeeds created the need for it. The plain citizen has no "influence" and does not know how to go about to get it.

There is less justice and more crime in the United States than in Great Britain or France. Which means that in those countries there is more justice and less crime. It might be well for the government to study the methods by which the authorities overseas avoid the political necessity of coddling criminals.

Growing Menace of Bank Control

MUCH of the disfavor into which the Federal Reserve System has fallen is caused by the means that System has taken to coerce the banks of the country into submission. Not only have non-member banks felt the influence of this autocracy, but member banks also have been made to feel the penalty of doing business with outsiders who will not submit to the tyranny of the Board.

The boycott ordered against such non-member banks indicates but one purpose, more menacing to the general public than the embarrassment of the institutions affected. That purpose is to concentrate in one controlled system all the banking reserves of the country, creating a sovereignty over the banking resources of the United States alarming to contemplate.

That purpose, of course, is denied, but belief in its existence seems to be justified. The plea for the creation of the system was that it would correct a situation which had led to periodic panics, by providing an elastic currency with a plentiful supply when and where needed. This object was not the desire of those who worked for a single central bank of issue, but they have managed to achieve their plans by administering the system in the manner complained of.

The same disposition is evident in the rural credit organizations created since the Reserve System has proved unfit to serve the needs of the country. The attention of THE DEARBORN INDEPENDENT has been called to the action of Federal Land Banks refusing to accommodate farmers because of the alleged delinquency of their neighbors. Protest against making an entire section suffer for the dereliction of a few inspired the explanation, quoted from a letter from the bank itself: "It is true that we have discontinued our loans in this area, pending clearance of this item, and doubt very much if we will again open without satisfactory assurance that the condition will not again be permitted."

Here is *a private institution, financed and assisted by the government,* denying aid to some of the very class for whose assistance the system was created because, forsooth, there have been delinquencies among their neighbors! It means that a community is deliberately penalized—military fashion—for the faults of a few. It means that the beneficent intent of the government has been defeated, and the opportunity and duty of the government-created but privately conducted land banks are skimming the cream of the farm loan business and leaving local bankers only the skim milk.

The real function of the Federal Reserve is not operative.

Mr. Ford's Page

IT WILL always be a question whether humanity moves on of itself, or is moved. However that may be, the most part of humanity resents moving on, especially if the movement requires any serious readjustment to life. The general idea is that the established classes have mostly opposed progress, but every class resents progress when it requires a readjustment. The masses of the people are not immune from the same motives that impel the more easily specified classes. They are all human and one of the common attributes of humanity is a grudge against moving on.

Sometimes this grudge takes decorative forms. Anyone with a sense of kinship to all men would say, offhand, that it is highly desirable, for example, that men and women and families should be able to move about and see their country, at least the general neighborhood in which they live, and mix with their fellow men, observing different modes of life and broadening their minds by absorbing and assessing the value of different ideas. No population is so helpless as that whose horizon is the village boundaries, or even the national boundaries. It is this wider acquaintance which makes the United States the wisest factor in international affairs today—our people, for the most part, are acquainted beyond our borders.

INDUSTRY has been made the butt of many charges, ranging from that of ugliness to that of destroying the creative abilities of men. The basic motive in these charges is the fact that modern industry has changed special privilege into general privilege and has put the peasant in reach of what only the prince formerly enjoyed. The fallacy which the lily-fingered advocates of a return to the handicraft methods of olden time have fallen into is that all the workers under the old system were "creative." They fancy that monotony is a modern invention. They have only to consider the hours, the conditions, the terms and the legal restrictions surrounding the old household handicrafts to see that modern industry has been a most potent agency in decreasing and almost abolishing both ugliness and monotony.

Yet, when first the means came by which the people could move about, the protest immediately was made that the advent of the locomotive was destroying the quiet of country places and the influx of city visitors was fatal to the romance which had always hung like a mist over renowned scenes. Wordsworth's protests have been echoed in our own times against the automobile. Only recently an esteemed gentleman, living in luxurious rustic retirement, spoke of "the accursed automobile," the cause of his distress being that the motor car had made it possible for school children, who would never otherwise have been able, to visit a place highly connected with the political and literary history of the United States, and to visit which is a moral and intellectual tonic.

The assumption is that only the select few may enjoy certain things and that the coming of larger throngs means thoughtlessness. Certainly it does, but thoughtlessness is no more effectively cured than by just such experiences.

That illustration, however, is not so illustrative as that which can be drawn from the protest against modern industry. The common element in every protest of the kind is that the multitude is made free of what formerly were *special* privileges. Miss Silk resents it when Miss Cotton gets a piano. The movement which takes pianos from their position as *special* privileges is thought to be a *leveling down* movement. Probably it is, a leveling down of those who fancy that mere possession is sufficient to constitute them a superior class. But it is a leveling up of all the rest, for it is the nature of *special* privilege to evolve into *general* privilege, and that which the lord has won for himself he must speedily share with the tenant.

Industry is under the ban of a certain type of mind for a number of reasons. At first it was because of the dislocation of employment. Every advance inevitably causes this. When the steam-loom came in the hand-spinners went out. When the cities expanded to the plains, the hunter and woodsman vanished. When the motor superseded the horse in many employments, the trades supported by the horse dwindled. When prohibition came, certain lines of business which were dependent on the saloon were compelled to undergo a readjustment to the new conditions. And yet the superior fact remains that the ratio of employment was not decreased but increased, more people today are employed than ever before, a larger proportion of the people are more profitably employed than ever before. The cost of production has been decreased, the price of utilities has been decreased, more comforts of life have been disseminated, and the margin of the worker's financial independence and opportunity has been widened.

Another reason assigned for opposition to the industrial advance is its ugliness. Something of the old simplicity was torn out of life, we are told. Yet one has only to compare the conditions under which the necessary work of the world was done fifty or one hundred years ago to see that there has indeed been a great gain in simplicity. Organization always means simplicity, it is disorganization that is complex. The ugliness of a new thing is proverbial. Growth and experience harmonize its design, smooth it out. From a work day lasting twelve to sixteen hours we have come to an eight-hour day and are looking forward to a six-hour day. The smoke nuisance (just to cite an instance on the esthetic side) has commanded millions of dollars in experiments for its abatement. Tremendous wastes which, if continued, would have fallen as a most tragic cost on society, have been curtailed and in an increasing number of instances abolished. Social relations affected by industry are receiving more corrective attention than ever before, but even so the social relations have been immeasurably benefited by modern industry as witness the higher dignity of the common home, the larger life of the children of the common home, and the more alert and forward-looking intelligence of the average workingman.

It is alleged, however, against these benefits that men are being turned into mere machines, the creative urge in them blotted out by the crushing monotony of modern labor. Against this it could be shown that in those countries where modern industry has not yet appeared there is a more bovine population than can be found in any industrial center. Those who muse in the villages of Europe are musing upon their musings, not upon the social facts there to be found. It is a very pretty conception among certain people that we must get back to handicraft to renew the creative spirit among men. Handicraft would be the end of railways, steamships, the printing press and the motor car—four great engines in the social service of the people. The things the world needs cannot be made in back kitchens nor in tiny shops on the back of the lot, and even if they were made there it could not be in quantities sufficient to meet the need of the world. Handicraft would be a return to *special privilege* under which only a few could have the needs of life fulfilled.

To assume, because men worked at handicraft in an age when no one but the lord possessed the comforts of life, that all such workers were therefore "creative," is going too far. The general population was not "creative," there were fewer artists than now. How many were engaged in the manufacture of violins we have no means of knowing; we know, however, how few were "creative" makers of violins or of anything else. Indeed, there was less freedom of industry under the old crafts system because the law operated to confine men to one trade and fined them for overstepping its limits.

Modern industry, being itself creative and the results of the creative work of multitudes of men, offers a wider scope to the abilities than has been offered at any other period in the whole story of man's living by his work. The outlets to energy of body and mind have been endlessly multiplied. Industry cannot maintain itself save by the continuous creative endeavor of all its beneficiaries.

It is merely a matter of observing and weighing the facts.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Digging the Facts Out of Anthracite Coal

In Which a Few "Neglected Truths" Are Given to You

By WILLIAM A. M'GARRY

There will be a second article by Mr. McGarry

IN THE furor which swept over the East because of the strike of the anthracite coal miners, the controlling fact, as usual, was completely overlooked. The United States Coal Commission issued reports and supplementary reports; various governmental authorities voiced their opinions; the newspapers wrote and are writing reproachful editorials against the attitude of the men, in the majority of cases, and there was much discussion of such incidental factors as the check-off and the wage rate—the demand for an increase. Each "authority" selected his own reasons for or against a strike, and then vociferated that it all depended on that one thing. But for some strange reason none of the experts took the trouble to inquire into the importance of the visible supply, which after all the arguments have been hashed over is and always has been the deciding influence for or against a strike.

Anthracite operators have been telling a half-truth about supply for a quarter of a century. They assert at all times that the price of anthracite is regulated by the time-worn economic law of supply and demand, which is one hundred per cent correct as far as it goes. Since that is so in all industries, it ought to be obvious that the only way to control price is to control that economic law, or the working end of it. Some industries accomplish that end by stimulating the demand. They advertise, they employ experts to find new uses for their products, they improve distribution and by reducing unit price increase the whole price—their own profits. But the anthracite industry has always preferred to control the supply; to keep it just enough below the demand, real or artificial, to enable them to maintain or to increase prices. Strike talk is the first step. It is a repetition of what has been done before.

Visible Supply the Factor

THE chronological record of the events leading up to the 1922 strike furnishes the best possible proof of the foregoing statement. When that strike was ended one of the New York newspapers got to looking over the record, and stories and editorials were printed suggesting rather guardedly that the whole struggle, from January to September, was nothing more than a colossal hoax of the public. It was insinuated, rather than charged, that when the record of negotiations was examined after the excitement of the strike had evaporated, it became evident that the "major issues" discussed for so many months were rather thin and unconvincing. A few other newspapers resorted to the well-known journalistic trick of trying to dodge responsibility by putting the suggestion into query form. They wanted to know if, after all, the strike was more or less of a cooked-up affair designed to furnish time for the country to absorb the visible supply of anthracite, so that there would be no danger of a glut of anthracite and a consequent reduction of price and profits.

The writer of this article put that question—and furnished facts in evidence of an affirmative answer—on five different occasions, three news stories and two editorials. The news stories were written as part of the anthracite assignment, twice without a specific editorial order for them, and once after consultation with editors. Both editorials were written after conferences in which the facts were presented. It seems almost superfluous to say that not one of the five accounts ever saw the light of day. For reasons of its own the newspaper to which they were contributed decided to continue frothing about the high-handed tactics of the men and the indifference of the operators to public rights. That newspaper, and all others in or acquainted with the anthracite consuming territory, can get the same facts today by an unprejudiced examination of the record. By printing those facts they can help to prevent another winter of hard coal exploitation.

The visible supply of anthracite is and always has been the controlling factor. There is no question that the men want the check-off, by which the operators will be forced to collect union dues from pay envelopes. It goes without saying that the men also want a twenty-per-cent increase. Conversely, the operators do not want the check-off and they do not want to pay a twenty-per-cent advance in wages. They would like to kick out the union and reduce wages. But more than these things the men and the operators want something else which is dependent on the visible supply. They want something which is mixed up with that mysterious but perfectly simple thing known as "overhead." That, at first glance, is purely a concern of the operators. But when it is examined it will be found that it concerns the men just as much as it does the mine owners, for out of it come wages and profits.

The overhead cost of operating a hard coal mine is known only to the operators, and according to their story it is tremendous. But no matter what the amount of it, it is perfectly obvious that the cash outlay is approximately the same whether the mine produces at one hundred per cent of its capacity, or at twenty-five per cent. Take, for purposes of illustration, an arbitrary overhead figure of $100 a day for a mine producing 100 tons a day. The cost, at full capacity, would be one dollar a ton for the myriad items going into overhead, and not including direct labor costs. But at twenty-five per cent of capacity, with twenty-five tons of coal produced, the cost per ton would be four dollars. If the operators were compelled by reason of a market glut of their product to operate on that basis, in time they would be compelled to stop pyramiding profits, to eliminate the wholly unnecessary coal sales companies, and to demand and insist on reasonable hard coal freight rates, in order to make a profit.

But if, for one reason or another, the anthracite mine can be closed until the visible supply is exhausted and the actual demand has been stimulated by newspaper reports of a "coal famine" all of those extra profit-making agencies of the anthracite industry may be maintained, and the price can be kept where it is, or shoved higher. At the end of the year the profit record will be larger, with the mine closed for a short period, than if it had operated for a time under part production. The overhead can be reduced to a minimum with the mine closed. In a word, it is cheaper to shut up shop. And that, regardless of whether there was an actual conspiracy, is exactly what the anthracite industry did last year, and exactly what it evidently plans to do this year unless some method can be found to prevent it.

A brief resumé of last year's strike is illuminating. The groundwork was laid in January, although officially the strike didn't start until April first. In January the Tri-District Convention of the hard coal miners was held. The word went forth that the miners had nineteen demands, among them a twenty-per-cent increase, the check-off, the twelve-hour day, elimination of contract mining and a number of others. At that meeting was a publicity representative of the anthracite operators. He was besought by the reporters to tell them something about the counter demands of the operators. In his brief case the press agent had "canned" statements announcing that the operators would ask for a twenty-per-cent reduction in wages. But at the last moment his employers had notified him not to release the statement. There was probably a mix-up of orders, for the press agent understood that he was merely to "let it be known" instead of handing out the official announcement.

Therefore he did "let it be known." Newspapers everywhere carried accounts of what each side wanted. They were labeled as "unofficial" but "on the best authority." But there wasn't the slightest question in the minds of the contestants—the operators and the miners—as to what the other side intended to ask for. Each side has its means of communication. The operators had more than press agents at the Tri-District Convention. They knew what was to be asked before the convention met. It was an open secret.

Nevertheless, with a great show of formality, the operators called a meeting for Atlantic City in February. They held it in deepest secrecy—all part of the game—on the upper floor of a big resort hotel. The meeting was shrouded in mystery. But when it ended and everybody had flocked back to Philadelphia, Samuel D. Warriner, spokesman for the operators, announced in a formal statement that the mine-owners would demand a reduction of twenty per cent in the wage rate. This, it was made clear, was not an answer to the men. The operators insisted that they didn't know what the men wanted, not having been officially advised.

Why the Meetings?

IN THE statement then made public Mr. Warriner let out a slight hint of what was in his mind. He said the time might come when it would be necessary to stop producing coal from the high cost, low production mines, unless they could be combined with low cost, high production mines and the overhead lumped, so to speak. But that was only incidental. He made it clear that the operators would insist on a wage reduction; he asserted that if wages were not reduced the price of coal could not be kept where it was. There were hints of reductions in price to gain the interest and sympathy of the coal-consuming public.

Then another meeting of the miners was held. It voted to strike on April first unless a new contract had been made by that time embodying the nineteen demands. Immediately government officials and others got busy "to avert a strike." The operators announced they would do "everything in their power" to help. To prove it, late in February, they made a date with the miners to meet in New York March 15—leaving only two weeks to draw up an agreement. Both sides knew that no agreement would be reached in that time. Both sides knew there was to be a strike, and knew the main, underlying reason for it, which was the visible supply.

Nevertheless, the game of blind man's buff went merrily on. The operators and miners met, as per agreement. A few hours were spent in "organization." A chairman and a secretary were named. Their names were known to everybody in advance, but nevertheless time was spent in discussion. A sub-committee was named. Then there was an adjournment for three days, to give the sub-committee time to organize, and to give the miners time to draw up their demands. At the end of the three days the sub-committee met and the miners presented identically the same demands as those published to the world in January, in February, and in earlier March. The operators, who knew every item backward, gravely listened to the reading of the demands and then as gravely asked for five days—or it may have been three—to "consider the demands."

At the expiration of that period there wasn't much time left before the strike. The government was still anxiously trying to avert the closing of the mines, without knowing how to go about it. The operators were promising the public that they would leave no stone unturned. They met with the miners and rejected the nineteen demands. Then they presented to the miners the same statement, in essence, as that which Warriner presented to the reporters after the February conference in Atlantic City—and the miners asked for time to consider the demands of the operators, and there was another adjournment.

Until the first "break" in the negotiations, in May, the hard coal conference was merely a series of adjournments. When the talk fest was resumed through the intervention of United States Senator Pepper late in the summer, the interrupted series was merely resumed. Everybody knew that the miners really wanted the old wage rate and would go back to work for it, originally. But as time passed the miners found that the operators were worrying over the invasion of their market by soft coal, and therefore the miners decided to hold out a little longer to see what they could get in addition to the old wages. More statements were issued, each containing the same old information.

And in the meantime the strike was being settled by the consumer. It was a little nearer settlement every day. If the consumer had not been stampeded into buying anthracite, there is very little doubt that the strike of 1922 would never have ended. For after all there was no reason to end the strike until the public wanted the coal enough to pay any price for it; no reason, that is, from the viewpoint of the operators and the miners. The visible supply was the controlling factor, and everybody but the miners and operators ignored it.

Warriner let the cat out of the bag in his February statement when he admitted that the retail price of anthracite, boosted over and over again for many years with or without a pretext, had finally got beyond the "economic limit." It cost, in a word, more than it was worth. He wanted to reduce it. People, in the winter of 1921-1922, were not buying anthracite in the old quantities. Soft coal, wood, oil—anything that would burn—was used for substitute. For the first time in history there was a threatened glut. Also, there was some mild weather, and production got altogether out of hand.

Facts Forgotten in Flurry

NEVER once during the negotiations would Warriner or other operators attempt to estimate the coal above ground. But newspaper observers who traveled throughout the anthracite producing and consuming region estimated that there was about thirty million tons on hand April first, when the strike was called. That did not include the coal already in cellars. Considering the growth of the use of substitutes, there was no doubt that if the mines had operated all last summer there would have been a glut of anthracite. The writer, in March, saw miles of loaded coal cars in the hard coal regions.

But those facts were forgotten in the excitement cooked up over the strike and the negotiations to end it. The news of midnight conferences, the estimates of how many people might freeze to death, the talk of a famine, were played up. The actual amount of coal and the figures of a reduced market were completely overlooked. And that meant a stimulated demand. It meant a pyramided demand.

When the strike ended, Pennsylvania named a coal commission. So did other states. Coal might have been much cheaper without the Pennsylvania Commission, which acted for the national body, for the commissioners were taken into camp by the operators. They authorized increases under which so-called independent operators got as high as twelve dollars a ton at the mines. Statements were issued announcing that there would be a "sixty per cent distribution" for all the hard coal consuming territory. Nothing was said of the thirty million tons on hand April first, which with sixty per cent brought the year's supply up to an average normal, and far above the actual coal needs of last winter.

Except for the juggling of shipments, prices and facts, there wasn't any actual shortage of anthracite last winter. There was a false demand, during which favored persons with the money put in a two-year supply while others went without. Everywhere the operators and dealers orated of optimism, saying "we'll do our best," but always encouraging the newspapers to believe that the situation was much worse than anybody knew, and concealing as far as they could the figures of actual production. Coal in Philadelphia was sold by some dealers as low as fourteen dollars a ton, and apparently they had no trouble getting enough to supply their customers.

Today the Fact-Finding Commission could do more by finding out just how much coal there is above ground than by all its statements and talk of government intervention. The writer has not had opportunity this year to estimate the supply on hand. But last winter was relatively mild. There was an overproduction in the latter months. Coal is now and has been piling up for some months. Demand was brisk in the early spring and summer months, and thousands of buyers are well supplied for next winter. The oil burner has come to stay. There are a dozen or more companies installing other burners, and most of them are operating throughout the anthracite territory—New York, New England and the Atlantic states, Canada and the Lake states. Soft coal men have formed an organization to take over the markets of the anthracite barons. All plans are formed to substitute soft coal wherever it is needed. Grates have been changed in thousands of homes to burn bituminous.

A strike would be for the usual reason: not to settle wage rates, or the check-off, but to hoodwink the public into a famine scare, to make those who have no coal order it from a dozen dealers, so that this multiplication of orders will create an apparent demand which will justify the prices now being charged, or higher ones.

The Cowboy as Ballad Maker of the West

Our Roughriding Cow-puncher Presented in a New Role by Professor Lomax

By EARL CHRISTMAS

The cowboy, pictured here taming wild lightning in the form of a bucking broncho, is a singer of interesting ballads.

THE cowboy has had an important place in American life. One of the chief factors in the winning of the West, he has been a romantic figure. When American life was getting a bit dull and colorless in spots, he came romping into our national consciousness with a "Whoop ti yi," and he's been there ever since, an example of most stimulating virility.

Action, adventure, physical prowess—he is the concentrated essence of it all; a kind of knight-errant, according to current impression, who revels in riding bucking bronchos and lassoing mountain lions. A man who shoots fast and hard as long as the villains hold out.

The picture is as familiar as the big hat, chaps and boots that feature his picturesque attire.

But it may be a new idea to most of us that, in addition to being a hero whose deeds have been sung far and wide, he himself is a producer of songs—he is the ballad maker of the West. The songs he sings as he rides his long watch often are his own, the product of a composite authorship and passed along by word of mouth just as the ballads of medieval England were handed down.

The cowboy has been presented in this new rôle by Professor John A. Lomax, of the University of Texas. Professor Lomax has made an extensive collection of the songs which have been sung by the cowboy and he has found in them a most interesting development of the old Anglo-Saxon ballad spirit, and discovered them to be compositions not without considerable merit.

Professor Lomax was born on a ranch in Texas. As a boy, he lived near the trail which the cattlemen took on their long drive northward, and often, "going up the trail," the cowboys camped near his father's house. So he early caught the atmosphere and became interested in the stories and songs of the cow camps.

Many years later, Harvard University also found the songs of the cowboys interesting when Professor Lomax repeated some of them during his work there. So interesting, in fact, and so important as one of our rare examples of folk songs, that it decided the songs must be preserved for posterity. So Harvard University, which is popularly regarded as interested in things somewhat more high brow, sent Professor Lomax out to gather up the crude songs improvised by the cowboy as he rode his night watch or sat around a camp.

For three years Professor Lomax traveled all over the West on a fellowship from Harvard University collecting the songs. He visited virtually all sections of the West where the cowboy still remains. Around the camps at night, in the saloons, wherever he could get the cowboys to sing, he jotted down the unwritten words of the songs and took down the rough cowboy music with a graphophone. The search was most fruitful. Professor Lomax came back with from three hundred to four hundred songs which have attracted unusual interest among all who have heard them.

The songs of the cowboy constitute one of our few examples of native folk song. America, being founded after the coming of the printing press and some progress in general education, is not so rich in ballad and folk literature as older countries whose civilizations date back to days when the songs and learning of the people were transmitted largely by word of mouth. Among the interesting exceptions are the Negro songs, songs of the lumberjack and the sea songs. But the songs of the cowboy afford perhaps the best example. Certainly they are the most typically American.

The cowboy is essentially an American institution, and his songs, while giving a valuable insight into that always interesting literature of the people that springs up as folklore when men are isolated from books and society, are important as reflecting the character and spirit of the cowboy. The cowboy's songs, Professor Lomax says, will give future generations a better index of his character than most of the fiction that is being written about him.

"One reason for the songs of the cowboy was the kind of life he led," Professor Lomax explained. "He slept in the open, with nothing but the stars above. He lived outdoors, away from society as most of us know it.

"He sang because he was lonely. He sang for entertainment. Out on the plains for months, cut off from the rest of the world, he was thrown on his own resources. He sang to express himself, just as his forefathers in England and Scotland used to do hundreds of years ago. It was largely the old Anglo-Saxon ballad spirit

"Then, too, the cowboys found that the human voice, in measured tones, had a wonderful influence in controlling their cattle. Cattle in big herds on the plains are easily frightened. A flash of light, or some unusual sound, may be enough to send them off on a mad flight.

"The cowboy learned to quiet his cattle by singing to them, calling or yodeling. Some of his best songs were created and used to keep his cattle from stampeding. This reason for the songs is expressed in a familiar cowboy verse:

What keeps the herd from running,
Stampeding far and wide?
The cowboy's long, low whistle,
And singing by their side.

"The cowboys in charge of the herds during the long night watches frequently improvised and sang lullabies to their cattle with this idea of quieting them and soothing them to sleep. There is a 'Night Herding Song,' much sung by the cowboys, which illustrates this type. Here is one verse of it:

Oh say, little dogies, when you goin' to lay down
And quit this forever siftin' around?
My limbs are weary, my seat is sore!
Oh, lay down, dogies, like you've laid before,—
Lay down, little dogies, lay down.
Hi-oo, hi-oo, oo-oo.

"Sharp, rhythmic yells, sometimes in verse form, also were used to stir up the cattle when they lagged behind.

"The songs sprang up naturally this way. One cowboy passed a song along to another, who perhaps added a touch here and there, making it more or less a joint product. Usually the original author is unknown.

"However crude the songs are, one is impressed with their genuineness. They are not the product of any scholarship, but they do have a quality that some more polished writers need. Not of any great literary value except as folk songs, perhaps, they do throw an interesting light on the character of the cowboy and present in a vivid and picturesque way some of the customs of the time. For instance, here is a bit from an old cowboy song:

Stray in the herd, and the boss said kill it,
So we bedded that stray in the bottom of the skillet.

"You see, it was the somewhat prevalent custom when a cattleman found a stray animal in his herd to kill it and eat it. Here's another bit from the same song:

It's cloudy in the west, a-looking like rain,
And my old slicker's in the wagon again.

"This fellow had forgotten to take his slicker out of the chuck wagon when he left it, and now, with the wagon probably many miles away, he was due to get a good wetting."

In fact, that's just what did happen. A few verses further on in the same song, we find this couplet:

No chaps, no slicker, and it's pouring down rain,
And I swear I'll never night herd again.

Often the songs were in the form of a rough chant, Professor Lomax explained, as if adapted to the movement of a horse. Sometimes the words were fitted to old tunes. In many songs there is a certain note of sadness, doubtless the expression of a feeling or mood influenced in part by the cowboy's environment.

"Night and the vastness of the plains apparently made a very deep impression upon the cowboy," he said. "In his yodeling, there is more or less of a sad note. It was only natural. In most cases, he was far from home and his early associations. Singing out there at night alone, there was something of this in his music."

That there is a wide if not universal appeal in this is attested by the great circulation of a song—especially the refrain—that bore, I think, the title, "The Dying Cowboy." This refrain, popular particularly

(*Concluded on page 12*)

By J. E. Haynes, St. Paul.

This looks fairly interesting, but the cowboy often had a lonely vigil, especially in the long night watch. At such times, Professor Lomax says, he formulated and sang many of his best songs, often to quiet his cattle.

An Intimate Story of How "Cal" Coolidge Made History in Bay State Politics

In Which the Writer Takes the Reader Back to the Days When the President Smoked Stogies Because They Were "E-economical"

By HAROLD D. CAREW

"'CAL' COOLIDGE is in town to see what kind of support he will get for the lieutenant-governorship. Can you imagine him in a fight with Guy Ham? Why, he'll not even think he's been in the running when Ham gets through with him."

The man who thus addressed me one day in the summer of 1915 in the historic old Parker House in Boston was accounted one of the cleverest political prognosticators in Massachusetts. He had served in every annual political campaign for nearly a quarter of a century and his name was magic to every aspiring officeholder from Cape Cod to the Berkshires.

"'Cal' lacks the 'pep,'" my political friend continued. "He hasn't the personality, and you know he can't get up and say a dozen consecutive words without getting stage fright. Guy Ham is a 'live wire,' and he'll talk 'Cal' into insensibility."

The man who was unburdening his opinions, I knew, was a man whose opinions were sought by the Republican leaders. They counted for something; and while a newspaperman's duty is to listen and watch from the side lines, I made bold to suggest that perhaps the time was ripe for just such a man as "Cal" Coolidge to surprise the political "wiseacres" by giving them a jolt.

He Was a "Regular"

I REMEMBERED that one Calvin Coolidge had come down from Northampton, a city in the western part of the state, as its representative to the Great and General Court of Massachusetts. That was in 1907. His coming had been so unostentatious and his appearance had been so unpromising, as far as the politicians were concerned, that he might just as well have stayed at home. He was just another of those up-state chaps who were regarded as "safe" for the Republicans. He was sure to stand without hitching. He had been trained to "view with alarm and look forward with apprehension." He was "regular" in every sense of the word; but his regularity never led him into bitter controversy. Indeed, he had come down to Boston with a burning desire to serve conscientiously and well.

His previous experience in politics had been decidedly limited—limited in the sense that practical politicians consider political experience. He had served in the city council of his home city—the city he had adopted as his home after coming down from Plymouth, Vermont, and finishing his education at Amherst College; had served two terms as city solicitor; had been appointed clerk of courts in his county, and had been chairman of the Republican ward and city committee.

That the politicians on Beacon Hill were justified in regarding the new member of the House of Representatives as only "one of the up-state crowd" was shown at the close of the annual session by the fact that during the entire term Calvin Coolidge's voice had been heard but once on the floor of the House. He had spoken just eight words late one Friday afternoon when his colleagues were tired and anxious to get home for the week-end. "Cal" Coolidge had arisen and in a high-pitched. Yankee nasal drawl had said:

"Mister Speaker-r-r-r! I move that we na-ow adjourn."

It was not to be expected, therefore, that anything particularly brilliant was looked for in the aforesaid member from Northampton. But he was re-elected for a second term, after he announced that he would not be a candidate for the politicians' "customary" third. Nothing was heard from him in Boston until a year later when a press dispatch from the city in the Berkshires announced that he had been elected mayor of Northampton by only a narrow margin over his Democratic opponent. In 1911 he was re-elected, and the following year he showed up again on Beacon Hill as a member of the State Senate.

Not Held as "Live Copy"

IN THE upper branch of the legislature he made more of an impression. There he was one of forty members, while in the House he had been but one of 240, and a badly submerged one at that. Senator Coolidge was a quiet, uncommunicative little man who spoke only when he was spoken to. If he was buttonholed by a lobbyist he would listen patiently to what the lobbyist said concerning whatever bill the lobbyist was interested in, but he was never known to say he would be for or against any measure. All he would say is, "I'll give it my attention." Nobody ever knew how Calvin Coolidge was going to vote on a measure until he responded to his name when the roll was called.

The newspapers gave him no publicity; not because they didn't like him but because they never heard from him, and Mr. Coolidge never had anything to say for publication. He was what the newspapermen call "colorless." That is to say, he was not "live copy." Occasionally he would move that "we na-ow adjourn," but that was all.

At the close of his second term he was re-elected for a third term, and with the convening of the legislature a strange political happening occurred. Calvin Coolidge mustered up courage enough to canvass the Republicans among his thirty-nine associates to ask their support of him for the presidency of the Senate, and he found that a majority were ready to vote for him, probably on the ground that "Silent Cal" had never antagonized anybody.

Calvin Coolidge's election as president of the Massachusetts senate did not create any more excitement than the election of any other of his predecessors in the office, except in one particular. His address to that body was the shortest ever delivered by a presiding officer. It contained just one hundred words:

"Do the day's work. If it be to protect the rights of the weak, whoever objects, do it. If it be to help a powerful corporation better to serve the people, whatever the opposition, do that. Expect to be called a standpatter, but don't be a standpatter. Expect to be called a demagogue, but don't be a demagogue. Don't hesitate to be as revolutionary as science. Don't hesitate to be as reactionary as the multiplication table. Don't expect to build up the weak by pulling down the strong. Don't hurry to legislate. Give administration a chance to catch up with legislation."

Of course, the city editors seized upon the shortest address on record, "boxing" it and alluding to it as a model for all politicians on Beacon Hill. Naturally it was read, and probably forthwith promptly forgotten as so much the politicians do and say is forgotten.

There was good reason why the political prognosticator thought Mr. Coolidge's chances would be slim. His opponent was Guy A. Ham, a Boston attorney and a member of the Governor's Council, whose training as a public speaker had made him well known throughout the Commonwealth. At the outset he appeared the likely winner, and when "Cal" modestly announced that he would be a candidate for the Republican nomination for lieutenant-governor, his candidacy was taken as the "joke" of the campaign. My political prognosticator's remark that "Guy could raise dollars where 'Cal' couldn't raise fifteen cents for a campaign fund" was one of significance. Colloquially speaking, the rising young Boston attorney "had the bulge on the other fellow." I believed the gentleman knew what he was talking about. A salary of $1,000 a year as a state senator didn't go much further then than it would today, and it was known that "Cal" didn't have any rich relatives to finance his campaign. But during the campaign it was said on good authority that "Cal" had confided to one of his supporters that he "hadn't lost in any fight I've been in" and that he "didn't think I'm going to lose in this one." It was a remark that amused the politicians. "Let 'Cal' alone," they counseled condescendingly among themselves; "he may as well do his dreaming on his feet as do it in bed."

Smoked Stogies Then

ONE night about three weeks before the primary election—a hot August night such as Boston has in midsummer—I sat in a small stuffy room in the Adams House in Boston. Its furnishings consisted of an old-fashioned mahogany bed, two straight-back chairs, a bureau and a sink. The single window opened into an air shaft. This was Calvin Coolidge's Boston "home," the room he occupied while the legislature was in session. Looking back now at that room I cannot but feel that Calvin Coolidge would have preferred a better one, but the truth was that he couldn't afford it.

"Cal" Coolidge tilted his chair back and lighted a stogy—a strong black crooked cigar that used to sell in those days for two and a half cents, the Italian laborer's after-dinner smoke. He offered me one. "Will you try one o' these?" he said; "I smoke 'em because they're e-economical."

There was something picturesque in the very audacity of the man who, apparently single-handed, expected to beat the "machine." His opponent, politically strong and liked by everyone who knew him, had headquarters and printed literature and automobiles galore at his command—the machines of his admiring friends. "Cal" Coolidge's only "headquarters" was the small stuffy room in which we sat, now so thick with smoke from his stogy that you could cut it. As a matter of fact, "Cal" was about the most elusive candidate for the lieutenant-governorship the politicians ever had heard of. He was a mystery to them, and even those who might have been willing to support him didn't know where to get in touch with him unless they went up to Northampton.

Who was this man from Northampton that he should be seeking the lieutenant-governorship without consulting the High and Mighty? "What does Senator Lodge think of him?" they asked. They always asked such questions at Republican state committee headquarters in Boston—until last November.

I felt half sorry for Calvin Coolidge that he was in the fight. He was a lamb being led to the slaughter, I thought. If ever I felt that there was such a thing as a political "under dog," "Cal" Coolidge was one that night. He hoped to "swing" a share of the down-state vote into line. I wondered how he was going to do it. He asked me many questions—even "Cal" will ask questions when he wants information. I told him frankly that in my opinion it would be folly for him to waste his time down Boston way, and said I thought he could use it to better advantage out where the Boston Republican "machine's" influence didn't count for much.

"That's just what I've been doing," said "Cal." "I'm confident I can get a big majority in the western part of the state, but as I figure it, I'll have to get a fair percentage down here to win."

I had never doubted the possibility of his getting a big vote throughout the rural districts of the state, but the big cities up that way, if they swung into his opponent's column, would cut down his lead, and I didn't think he could possibly get an even enough "break" in the down-state cities to put him across. But there was something that must not be overlooked. His name would come first on the ballot by virtue of the fact that all candidates' names were then placed on the ballot alphabetically.

Silence Wins Success

"YOU'VE a good old-fashioned Yankee name," I said, trying not to be too serious, "and 'Calvin Coolidge' ought to sound pretty good to the average Republican. Even your opponents concede that first place on the ballot will net you five per cent of the votes cast because many voters who don't have any preference will mark a cross against the first name under each office."

The future President of the United States chuckled. "But it'll take more than five per cent to win this fight," he said.

* * *

As a political candidate "Cal" Coolidge was "different." He was no hand-shaker; he didn't pretend; he had no political vocabulary such as so many office-seekers think is necessary to impress others with their knowledge of politics. The politicians were puzzled. Here was a man seeking the second highest office within the gift of the people of Massachusetts, and he didn't even have a press agent! He absolutely refused to "play the game" as politicians are supposed to play it.

The Progressives, spent as a third party political force, were flocking back into the Republican party. Many went into the Coolidge camp. It wasn't that they wanted Coolidge particularly; they merely wanted a change. Coolidge was a "decent sort of fellow"; his record hadn't been half bad, they argued. He didn't appear to have the "machine" back of him. A bitter antipathy was still apparent against everything that savored of "machine dictation."

The votes were counted on election night and lo! Calvin Coolidge had won. He had "minded his own business." There was virtue in silence, and Calvin Coolidge had "cashed in" on his reputation of being a man of very few words. And then the politicians began to talk about his "lucky star." They're a superstitious lot, these "practical" politicians.

As is customary in Massachusetts, the lieutenant-governorship is considered a stepping-stone to the governorship. When it came Mr. Coolidge's turn to step up, the politicians welcomed the event with disapproval. For "Cal" Coolidge had committed the unpardonable political sin. He had not fawned at the feet of Henry Cabot Lodge.

Then Comes Police Strike

"CAL'S" Democratic opponent for the governorship was Richard H. Long, a Framingham shoe manufacturer. Mr. Long was a "live wire" with progressive ideas, and he bellowed those ideas from one end of the state to the other. When the votes were counted, "Cal" had only 7,000 plurality—one of the smallest pluralities ever given a Republican candidate for the office.

The campaign developed nothing new in Calvin Coolidge; it brought out no new angle of this strange personality; there had been nothing to fasten upon him the gaze of an admiring electorate; nothing to indicate that nine months after he had become governor, by his action in the Boston police strike, he would focus the country's attention upon himself as a potential candidate for the Presidency. All in all his campaign had been about the most colorless the politicians ever remembered having seen. But nine months later the imperturbable "Cal," the man of quiet reserve, the man the politicians had been calling "the human iceberg," was the most talked-of official in the United States.

The Boston police strike was not a sporadic event. Discontent had gripped the entire department for many months. The men wanted an increase in pay; had wanted it, in fact, since before America's entrance into the World War. The police commissioner, Edwin U. Curtis, a former Republican mayor, found himself in a

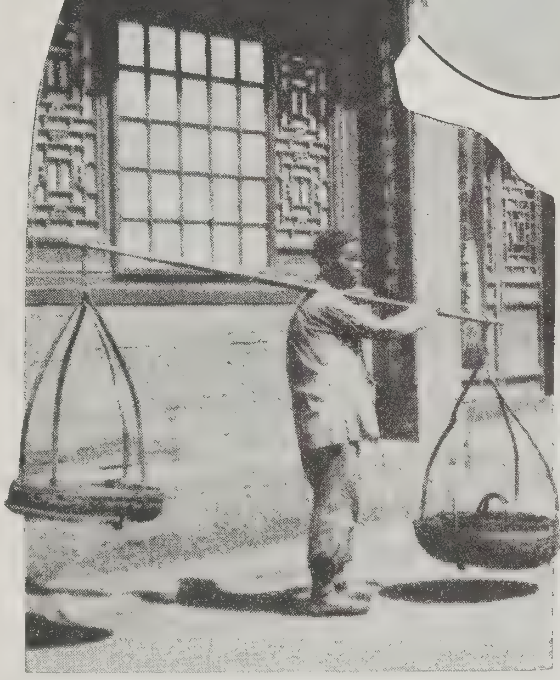
(Concluded on page 14)

En Tour in China: Glimpses of Life in Hunan

A Trip Across Country in the South—Described by Roy Franklin Cottrell

The charcoal man.

The shopkeeper.



A fruit vendor.

OUR suitcases were packed; rolls of bedding and folding cots were prepared; and "Beautiful Jewel," our cook, announced that the lunch box, filled largely with imperishable foods, was ready to be locked. Leather-skinned coolies, the city transfer men, after the usual bantering and bartering, skillfully suspended our twelve pieces of baggage from the ends of poles which they balanced over their shoulders for the jog trot to the railway station a short distance outside the east gate of Changsha. Here we were joined by Mr. Hwang, whose pulse beat a little faster, and who held his head a little higher because of his relationship to the noted revolutionist, the late General Hwang Hsing. Presently the train came into sight from behind a projection in the imposing city wall. The soldier guards clanked their heels together and stood at attention. Amid such shouting, tumult and confusion as is characteristic of most oriental lands, passengers alighted and passengers entrained. The station gong sounded; a trainman blew a shrill police whistle; the engine tooted—and we were off. The locomotive, an American product, responded to its Chinese engineer with a velocity of some twenty miles an hour; but the cars, with cushionless, springless seats, were of such lumbering, rattletrap construction that the physiological sensation did not differ materially from a treatment in a sanitarium vibrating chair. Even this was a vast improvement over other methods requiring nearly a day to travel the same distance which we were now enabled to cover in one hour.

At Liling, the railway destination, a sedan chair conveyed Mrs. Cottrell into the walled city, while Mr. Hwang and I were provided with Chinese ponies. Lining either side of some of the narrow streets were petty merchants displaying miscellaneous products and wares. With considerable difficulty we threaded these crowded thoroughfares, and when my pony stumbled, overturning two baskets of grain and narrowly averting more serious catastrophe, uproar and blockade were inevitable. Large native porcelain potteries formed the principal industry.

Before leaving for the south, a Chinese friend advised traveling by the Liling wheelbarrow, which, he asserted, was of superior construction. The paths, too, he stated, were very smooth and we might thus avoid the seasick swing of the sedan chair. We acquiesced; our luggage was securely bound upon some of these conveyances, while our bedding and pillows were arranged upon others to serve as springs and upholstery. China, we have observed, boasts of many types of wheelbarrows; some are equipped with a large sail spread to take advantage of a favorable wind; others are built for stair climbing and ditch jumping, which feats are made possible by having two wheels, one directly ahead of the other, so that by simply raising and lowering the handles, the vehicle may be made to surmount obstacles. The particular species provided for us on this occasion was similar to the Shanghai barrow, which is constructed with a frame built over and around a large wheel somewhat more than two feet in diameter, thus properly balancing the load fore and aft. On one of these we have frequently seen as many as ten or twelve factory girls riding to or from their work, all propelled by one tense, perspiring unit of Chinese rice power.

Numerous hills and vales were beautified by a semi-tropical verdure, while here and there wistaria vines and patches of blooming wild roses enhanced the rural landscape. Distant villages with tile-roofed, white-walled dwellings stimulate our fancy and seem to lure us onward; but nearer approach and inspection only reveal the typical Chinese town with its narrow, filthy streets, its famous variegated odors, its pigs, dogs and ragged and naked children. The only picturesque details that linger in our memory are the names displayed over village inns, such as "Silver Palace," and "Eternal Peace Restaurant"; while anon we pass an exceptionally poor, dirty, tumble-down pilgrims' lodge with the conspicuous sign, "Gold Dollar Hotel."

On and on creaked and squeaked our wheelbarrow caravan. We proposed to the coolies that they stop and oil up, thus effecting an economy in both muscular and nervous strain, but our suggestion was unappreciated. The superstitious celestials replied, "We Chinese fear demons; if the wheelbarrows produce a great noise, that will frighten them away so that they will not harm us." Our bumping, joggling, tilting, springless carriages wearied us; and after some four hours' travel we paid off the men and continued our journey by sedan chair.

That evening, rain and darkness overtook us early, and the coolies hastily made their way to a village inn. In response to our inquiry if this was the best hotel in the place, they replied that there was no other within several miles. The only private guest room in the establishment was forthwith prepared for our occupancy. The floor was mother earth; the walls were of mud; there was but one lattice window, hermetically sealed with paper; and the only hope for ventilation was in the air that might filter in through the crevices of the tile roof. Before our light supper was finished, the mosquitoes began a vicious attack, thus compelling the use of mosquito nets over our folding cots. Never shall we forget the stifling, choking sensations of that night. In the large main room just outside our door, stretched on benches, dining tables and floor, were some fifty guests, some of whom visited together until after midnight, while three or four hours later, others began their preparations for another day's travel.

We were off at daybreak, and just a little past the hour of noon reached a swift-running mountain stream. The boats were of very frail, shell-like construction with high rounded bow and stern. Into one of these our baggage was soon transferred, and, after many annoying preliminaries such as travelers in the Far East can better appreciate than describe, we stepped into the little craft: the old boatman took his position in the stern, while his son, a lad of some fourteen years, stood at the bow: each was equipped with a pike pole to direct our rapid, devious course. We were hungry, and had thought to eat our lunch immediately after starting, but the voyage was proving altogether too interesting. Better to control the stream, the natives had erected dams, each with a narrow

House and cargo boats on the Soochow Creek, Shanghai.

Monetized Gold and the Curse of Unemployment

How Millions Have Faced Want in Midst of Plenty, While Professional Economists Jabbered About Law of Supply and Demand

By J. V. NASH

THE Gold Standard was first adopted by England early in the nineteenth century. Unemployment as a national problem arose first in England. It is more than a coincidence that its appearance in the United States closely followed the adoption of the gold standard and the control of finance by the international gold monopolists.

It was in the early nineties that the problem of unemployment began to grow so acute and to involve suffering among millions, attended by a startling increase in drunkenness, vice and crime, that social agencies and finally the government were forced to grapple with it. Hundreds upon hundreds of reports, pamphlets, and books have been printed upon the subject, but none has gone to the root of the trouble.

Without exception the professional economists in discussing the causes of unemployment have prattled incessantly 'about overproduction, business cycles, and above all, the law of supply and demand.

In 1900, in the United States, 22.3 per cent of the gainfully occupied population over ten years of age was reported as unemployed for some part of the census year. About one-half of those reported idle were unoccupied for three months or less, and four-fifths of the rest were unemployed for a period of four to six months. The census of that year showed more than 2,600,000 men and approximately 500,000 women out of work seven months or more.

The Federal Bureau of Labor in 1901 found that among 25,440 families of the working classes with salaries of $1,200 or less, 49.81 per cent of the heads of families were idle part of the year.

The Geological Survey, in its report on conditions in the mining industry from 1890 to 1910, found that twenty-two to forty-three per cent of the time of miners in the bituminous region was lost annually and twenty-three to fifty per cent of the time of those in the anthracite region, exclusive of the year 1902 when the great coal strike was on.

The New York State Department of Labor found among skilled workers an average of 18.1 per cent idle from 1901 to 1911. The Commissioner of Labor in New York State likewise reported that of 600,000 organized wage earners, 101,000 were idle (16.1 per cent of the men) in 300 trades or branches between September, 1912, and September, 1913. This increased to 38.8 per cent on December 31, 1913.

Analysis showed that ninety-two per cent of this idleness was due solely to lack of work and only two per cent to labor disputes and strikes.

Conditions in New York City were even worse. At the end of December, 1913, 45.5 per cent of the workers were reported in various degrees of unemployment, including ninety per cent of the clothing trades and two-thirds of the union members of the building trades.

Millions of workers throughout the country were thrown out of employment for varying periods by the panic of 1907. In the winters of 1913-14 and 1914-15, the unemployment situation in all our large cities was more tragic than ever before, and the suffering among the poor necessitated the expenditure of large sums by the municipalities to keep thousands of families from starving and freezing to death.

Gold Standard Not Needed

THEN came the war and the flooding of the country with contracts for war material to be shipped abroad, followed by the participation of the United States in the war and the drafting of all the able-bodied young men into the army. This, of course, brought about an era of false prosperity in which unemployment dropped to zero. The war-begotten boom was naturally of a temporary nature, the immense majority of the goods produced being intended for purposes of destruction.

During the first year of peace, the country entered upon a period of high production. For a few months employment could be had by any willing worker at better wages than ever before in history. *We were getting away from the gold standard, Federal Reserve notes being issued freely on commercial paper.* Then, in May, 1921, the big bankers began to take alarm for the "stability" of their gold, and with the assistance of the Federal Reserve Board made haste to get the country "back to normalcy," that is, a condition of low wages and sufficient unemployment to assure two or three applicants for every vacant job.

And so the country went through the much-lauded process of "deflation," whereby at the beginning of 1921 several million men, with other millions dependent upon them for support, had been thrown out of work. Throughout that year the number of unemployed increased steadily.

Conditions in the United States were paralleled in England, Canada, and other countries. In 1921, says the International Year Book of 1922, *"unemployment seemed to be more serious in the countries that did not suffer from the debasement of the currency . . . . For a time there was even a parallel between the upward movement of exchange and the increase in the number of men out of work."*

In other words, *it was precisely in those countries which had the most gold that unemployment and its attendant misery was most widespread, whereas in Germany and other countries in which the bottom was dropping out of the gold standard, unemployment disappeared and industry was humming as never before.*

By October, 1921, the unemployment situation had become so acute that President Harding called a conference to consider ways and means of relieving the situation. This conference found that between 3,500,000 and 5,000,000, of whom nearly a million were ex-soldiers, were at that time out of employment in the United States. Millions of others, of course, were dependent upon these unemployed, the Department of Labor estimating that the number of dependents reached 10,000,000 to 15,000,000.

In his last Annual Report, Secretary of Labor James J. Davis made the following significant observations:

"Less than a year ago (early in 1922) it was estimated that between 5,000,000 and 6,000,000 workers were without jobs. We were in the throes of one of the greatest industrial depressions we had ever known. The nation fought its way through this period of unemployment. We are back at normal in our employment, *BUT WE HAVE MADE THE STARTLING DISCOVERY THAT NORMAL IN AMERICA MEANS THAT APPROXIMATELY A MILLION AND A HALF WORKMEN ARE DETACHED FROM ANY PAY ROLL."*

Tinkering—That's All

DURING the past ten years many efforts have been made by various governmental agencies looking toward the cure of unemployment, but all the measures suggested have been in the nature of mere tinkering with the disease.

Among the remedies proposed, and put into effect on a greater or smaller scale in this country or in England, have been the following:

1. The establishment of free employment agencies to bring men and jobs together.
2. Road building programs and other public works to give employment to the idle.
3. The creation of a reservoir of jobs by holding up great public improvements, and so forth, until times when unemployment assumes a desperate character.
4. The payment of doles or pensions to the unemployed, out of the public treasury.
5. Assisting the unemployed to settle on farms or to emigrate.

Following the President's conference on unemployment, Secretary Hoover issued an optimistic statement, calling attention to the fact that, as a result of the conference, "municipal bond sales for public works have broken all previous records," that "Congress has inaugurated important public works, amounting to $150,000,000 for highway improvement alone," and that various other measures have been introduced into Congress providing for "long range planning of public works."

California passed a law for the extension of public works to provide a maximum of employment in times of extraordinary unemployment.

It should be obvious to any layman that these remedies are the merest "tinkering" with the problem. In the first place, highly specialized industrial employes are not fitted to become ditch diggers and road builders, nor can they leave home and family in large numbers to seek such employment; and these vast public works, for which there is no real necessity, involve the floating of immense bond issues, for which the workers themselves as citizens must be taxed millions annually to pay interest. This means, too, the diverting of capital from productive industry into non-productive tax-exempt investments, at the very time when productive industry is sick unto death for lack of capital.

During the past few years there has been in England a much larger amount of unemployment proportionately than in the United States and the suffering has been correspondingly more acute. At this writing a vast army of able-bodied English workers and their families are living on the public doles and former Premier Lloyd George is reported to have said that no relief can be seen without the emigration of ten per cent of the population.

Two million, one hundred and eighty thousand English workers were officially registered as unemployed in July, 1921, while another million were registered as partly unemployed, in addition to 1,200,000 miners out of work, and many other thousands unemployed but not registered.

On May 22, 1922, the registered unemployed still numbered as high as 1,514,220. In September, 1921, government doles were being received by 300,000 workingmen, exclusive of dependents.

In nearly every country of Europe, except Germany, there was a problem of unemployment last year, although in some of them an improvement was shown over the year before.

In Czecho-Slovakia, the International Year Book states, "the unemployment crisis was aggravated by the rapid appreciation of the crown," while the same authority further states:

"According to French sources, the unemployment in Germany was less (in 1922) than before the war, and the situation of the labor market was exceptionally good. The percentage of unemployed to the total number of workingmen was reported at less than one per cent during the first seven months of the year (0.6 per cent in July and 0.7 per cent in August).

The economic loss due to unemployment during the past thirty years, if ever calculated, would reach a total of such staggering proportions as to make the combined war debts of the world look like small change.

That unemployment has been reduced to any extent during the past year has been largely due to the putting up of the bars against immigration, whereby we have curtailed our normal growth of population and shut out millions of potential wealth producers as farmers and industrial workers, notwithstanding the fact that the state of Texas has undeveloped land, of the finest quality in the world, sufficient to support with ease the entire present population of the country. It was recently estimated that in this single state there are more than 150,000,000 acres of arable land, less than 20,000,000 acres being in cultivation.

The gold standard system of finance dooms this magnificent domain to sterility.

A notable fact is that since the adoption of the gold standard in this country, panic years have occurred at shorter and shorter intervals with the growth of population and expansion of business. The introduction of the gold standard in 1873 was accompanied by a panic in that year; then came 1893, 1907, 1914, 1920, and already, before the smoke of the last panic and depression has disappeared from the sky, the financial experts in the newspapers are warning us to get ready for another; and gold, as usual, is preparing to scuttle to cover.

Must Expose Defects

WE SHALL not get at the root of panics and depressions *until the whole theory of the gold standard is threshed out and its defects exposed.* An enormous credit structure is raised, like an inverted pyramid, on a small pedestal of gold, and with the expansion of industry and increase of population this pyramid quickly becomes top-heavy and crashes to the ground, only to be slowly and painfully built up again until it falls once more and in a shorter time.

The fatal weakness of the gold standard theory of money is that it will not recognize that labor, not gold, is the source of our wealth. As Abraham Lincoln pointed out sixty years ago, labor is prior to capital, and the creator of it. Yet we have allowed gold to monopolize capital and to make labor its slave.

It was not a socialist, but the great English churchman, Cardinal Manning (See *Leslie's* "Life," page 375) who declared: "Labor and skill are capital as much as gold and silver. Gold and silver are dependent on labor and skill, but labor and skill are independent." And he added: "There is no justice, mercy, or compassion in the plutocracy."

In other words, human labor and skill, the source of all real wealth, have become the helpless victim of a heartless and merciless gold plutocracy, personified in the United States by "Wall Street," which denies to labor and skill the right to work (and therefore to eat and be clothed and sheltered) beyond the point necessary to produce profits in the form of interest upon the gold which these financial monopolies control, and without the use of which as capital, under the gold standard system, no industry can be operated and no farm tilled.

Are the Jews "God's Chosen People"?

Concluded from page 2

"coreligionist" but he is not a Jew. The term "Jew" is a racial term denoting membership in a certain racial stream, which mere conversion to a religion cannot confer. If anyone is of the opinion that acceptance of *"the Chosen People"* idea involves acceptance of the Jews as the Chosen People he has only to reflect that even if the Bible did describe the Jews as the Chosen People, *as it does not,* few present-day Jews could qualify. For the most part they are not pure blood descendants of the tribe that remained longest in Palestine. Read the article on "Chazars" in Vol. IV of the Jewish Encyclopedia for information as to how whole multitudes of modern Jews became "Jews."

It is therefore no longer necessary for believers in the Bible to attempt the impossible task of reconciling their faith with the superstition that all types of Jews, particularly the numerous lower types, are "God's Chosen People." It is known, of course, that one society of Bible believers makes it a point to meet incoming Russian and Polish Jews with pamphlets setting forth that the Jews are to become rulers of the world, according to God's promise and by means of the present upheaval in world affairs. That sect has simply overlooked the plain distinctions made in the Bible. And that sect's leaders are so set on this superstition that they will not re-examine their position. Nothing is more fatal for a religious leader, apparently, than to admit that he has taken an indefensible position.

In the first place, this indiscriminate mass known as Jews are not the Jews of old, nor even their remote descendants.

In the second place, the House of Judah was not the "Chosen" inheritor of world dominion and world blessing.

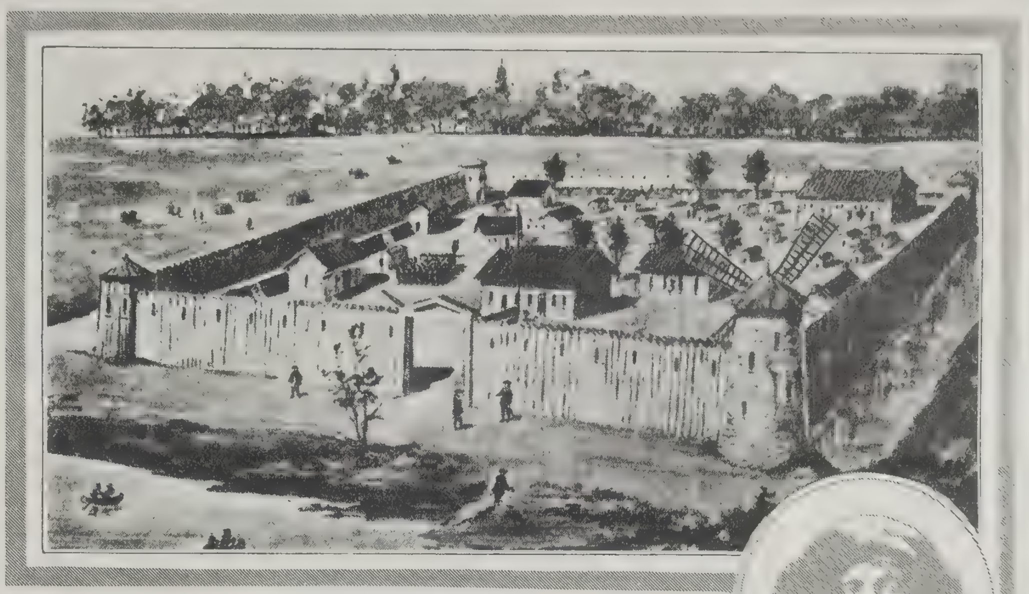
It is merely a matter of accurate reading of the Book as it stands. Inaccuracy appears when the Bible itself is spoken of as "a Jewish Book." A survey of the great characters of the Bible shows a very small minority to be Jews, and a survey of the writers of the various books shows a still smaller minority to be Jews. The Bible is perhaps the original "anti-Semitic" book (to use a much abused term) because it contains harsher treatment of this people than does any other book.

Another article will discuss the question, "Was Jesus Christ a Jew?"

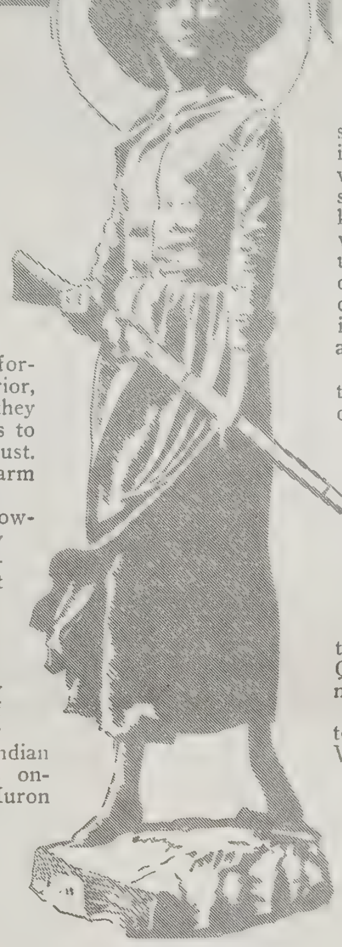
Marie de Vercheres: a Heroine of New France

A Bit of Heroism Torn From the Pages of Early Canadian History

By D. M. LE BOURDAIS



Fort Vercheres, on the St. Lawrence River.



MARIE MAGDELAINE DE VERCHERES.

HEROISM is the exclusive attribute of no one race or nationality; nor is it peculiar to either sex. Doubtless many unknown acts of heroism are performed in the daily lives of those who are commonly termed ordinary people which are as worthy of general approbation as any that receive recognition upon the printed page; but the world's attention is challenged only by the unusual, the spectacular.

Man's contest for mastery of the elements, and the conflicts arising out of human passions and greed, have provided the chief opportunities for the performance of spectacular acts of heroism. And the division in the respective duties of men and women, due as it is mainly to biological causes, has thrown to the so-called sterner sex the greater opportunity in this regard. But women, in spite of this disadvantage, have not failed to place upon the page of history examples of heroism, in the field which men have been wont to consider as peculiarly their own, quite as brilliant as any of the exploits of men extolled by bards since time immemorial.

Moreover, these exploits of women have generally been representative of the people among whom they were performed, and typical of the times in which they were enacted. Thus England, who owes her place in the world to the sea, is represented in the gallery of heroic women by Grace Darling, whose courage rose superior to the fury of the winds and waves; France by Joan of Arc who, inspired by religious and patriotic fervor, drove the invader from her beloved France; and Canada, then a bit of France in the New World, has the memory of 14-year-old Magdelaine de Verchères, who, by rare courage and presence of mind, defended Fort Verchères during her father's absence for eight days against a force of hostile and vigilant Iroquois with no assistance other than that of her two younger brothers, two soldiers, a manservant and an old man of eighty.

From the time when Jacques Cartier first set foot on Canadian soil in 1534 until the year 1608 when Champlain established the first permanent settlement of New France at Quebec, the French court paid little attention to the great empire which had been claimed for France by her sons. And, indeed, for many years after the founding of Quebec, French ministers gave but feeble support to the struggling colony. By 1627 it numbered only some 300 souls. But this did not suit the great Richelieu, minister of Louis XIII. He handed the affairs of the colony over to a company which, in return for the exclusive privilege of the fur trade, agreed to bring out settlers and assist them in gaining a footing in their new home. The fur trade and land settlement, however, have never gone hand in hand. The company was interested in dividends; and dividends were only to be obtained from the traffic in pelts. So settlement languished still.

A change, however, came over the scene when Louis XIV began, in person, the direction of affairs at the close of the Regency. The *Grand Monarque* was really interested in his possessions in the New World; and his minister, Colbert, was even more so. With one sweep the king put an end to the rule of the company and placed the government of the colony under officers directly responsible to himself. Representing the king, and chief military officer, was the governor; the bishop headed affairs ecclesiastical; but the individual who represented the king in the rôle of father of his subjects was the intendant; he had control of the civil affairs of the colony, the granting of land and all matters appertaining to colonization. The first intendant, Jean Talon, who arrived in the colony in 1665, was a wise and just man under whose management New France made greater strides than at any time during the previous century.

While the slow progress made in settlement was the result of negligence on the part of the French court, occupied as it was with costly European wars, the area of land actually cleared and placed under cultivation was really less than was warranted by the population of the colony. For this there were many reasons, but the principal cause was the red man of the forest. He affected the situation in ways more than one: in the first place, by providing an opportunity for the colonists to trade in pelts, he bred in them a disinclination to remain on the land and endure the monotony and toil of the lot of the husbandman, while both fortune and adventure could be attained by following the easy life of the trader. During the rule of the company this trade was, of course, illicit; but it was carried on in spite of stringent regulations which the authorities sought to enforce. Afterward, the conflict was chiefly between the *coureurs des bois* on the one hand, and the missionaries on the other. One of the principal articles of commerce in this trade was brandy. Under its influence the Indians were speedily becoming debauched, and the missionaries viewed with alarm the rapid undoing of many years of painful effort. The close connection between church and state made it possible for the former to secure the promulgation of royal decrees forbidding under severe penalties the continuation of this illegal trade; but despite the efforts of officers of the crown, and threats of dire disabilities from the church, each year saw greater and greater numbers of the most daring and most adventurous members of the community leaving the settlements for the half-wild life of the forest. They penetrated the vast unknown interior, following the rivers to their sources, and they blazed the trails for the civilization that was to follow long after they were turned to dust. But the colony was robbed of their strong arm when its need was great.

The red man was responsible for the slowness of settlement, in the second place, by reason of the implacable hostility of the Iroquois. Shortly after establishing the first settlement at Quebec, Champlain had rendered assistance to the Hurons and Algonquins in their wars against the Iroquois, the most powerful confederation of Indian tribes in North America. This had not only earned for the French the undying enmity of the Iroquois, but it had so aroused the fury of the latter against their traditional Indian enemies that they, by a series of vicious onslaughts, practically decimated the whole Huron nation. This left the French to bear the brunt of ceaseless attacks without the possibility of any very great assistance from their former Indian allies. From their homes in what is now the state of New York, the Mohawks, the mightiest of the Iroquois tribes, were wont to come up Lake Champlain and down the Richelieu River, falling upon the settlements along the St. Lawrence, killing and scalping the settlers and burning their homes. Under these circumstances it was not strange that settlement languished.

Finally, in desperation, the authorities at Quebec petitioned the king to send out a regiment of regular troops to teach the ruthless savage proper respect, and to maintain the prestige of French arms. Thus it was that in 1665 there arrived at Quebec the famous Carignan regiment fresh from the victorious battlefields of Europe. The first expeditions against the Iroquois were not particularly successful, owing to the inexperience of European officers in Indian warfare, but eventually the Iroquois were effectively subdued. So long as these 600 regular troops remained in the colony there was likely to be comparative security from attack, but the maintenance of such a body of men would rapidly reduce the struggling colony to a condition of bankruptcy. It was at this point that the sagacious Talon conceived the idea of borrowing a leaf from the book of the Roman empire: he recommended to his sovereign that the famous regiment be disbanded and that those of its officers who wished to remain in New France be given grants of land and such other assistance as would enable them to establish themselves as seigneurs, the common soldiers to become their tenants. In return they would be subject to the call of the governor whenever the defense of the colony demanded it. The plan was adopted; and a great many of these seigneuries were located in the valley of the Richelieu, which was then called the *rivière des Iroquois.* In this manner was it hoped to found a military aristocracy, and at the same time provide an effective barrier against future depredations at the hands of the Indians.

Among those officers of the Carignan regiment who accepted lands was François Jarret, sieur de Verchères. He was only twenty-four years of age at the time, and unmarried; but he soon fell a victim to the charms of a young girl of the colony to whom he was married in 1669. There were born to them twelve children, of whom Marie Magdelaine, who was to add a glowing page to the romantic history of New France, was the fourth.

The seigneury of Verchères was situated on the south shore of the St. Lawrence River, about midway between Sorel and Montreal. It consisted of two square leagues of land, more or less, with a frontage on the river and extending back almost to the Richelieu. Here, near the bank of the St. Lawrence, de Verchères built his fort and brought up his family. Like many others, he found it difficult to get settlers willing to cultivate the land, and when once secured, to keep them there. The nearest forts of importance were a considerable distance away and, being in the path of the Iroquois, Fort Verchères was particularly exposed to attack. Two sons met death at an early age—one in a fight with the Iroquois and the other in an expedition against the New England colonies. A son-in-law was also killed by the Indians.

Between the years 1690 and 1692 the French colonists were subjected to almost ceaseless terrorization. England and France were at war. Lurking parties of Indians swept down upon isolated seigneuries, killing and burning; men and women working in the fields were pounced upon and scalped; cattle were driven off, and crops destroyed. At length conditions became so bad that work in the fields was possible only when armed patrols were provided.

As the summer of 1692 waned, the depredations of the Iroquois eased off somewhat, and the tenants belonging to the different seigneuries who had retreated with their families within the palisades of the forts had begun to return to their respective homesteads. But the menace of invasion from New England was not entirely removed, and many of the seigneurs were still gathered at Quebec, whither they had been summoned by the governor.

Thus it came about that on October twenty-second Magdelaine de Verchères, her father at Quebec and her mother being called to Montreal, found herself in charge of the fort at Verchères. Besides herself there were in the fort her two younger brothers, a servant named Laviolette, an old man of eighty, two soldiers and a number of women and children, the families of some of the tenants.

Magdelaine was inspecting the boats on the bank of the river in front of the fort in the early morning when she was startled by the report of a gun, followed by cries of terror coming from the direction of the fields where a number of her father's tenants were working. As she turned, she beheld two score or more savages running in her direction, tomahawks uplifted. She ran with all speed for the gate, while musket-bullets fell thick about her, barely succeeding in swinging the heavy gates shut as the foremost of the Iroquois was upon her. In fact, she left her shawl in the grasp of the pursuer.

Once within, and a brief respite gained, she gave quick thought to the perilous position of the little company within the palisade. It was such as to daunt the most courageous. Outside the walls, their war whoops rending the air, clamored a band of bloodthirsty savages; while within, under the command of a young girl of fourteen, was perhaps the weakest garrison that ever held a fort, encumbered, in addition, by the presence of a number of women and children whose husbands and fathers had so recently fallen victims to the ferocious Iroquois. Some stakes of the palisade had been allowed to fall into disrepair and must be replaced immediately. This was done, Magdelaine herself assisting in the work. It was then that the two soldiers were found to be missing. Magdelaine, making a tour of inspection, the better to decide upon a course of action, finally discovered them hidden in the redoubt, one with a lighted fuse in his hand.

"What are you doing with this fuse?" she demanded.

"We want to fire the powder and blow up the fort," replied the poltroon.

"You miserable wretches," she retorted in indignation, "Begone! I command you."

Shamefacedly, the soldiers proceeded to execute her orders.

Addressing her brothers in words which will live as long as the annals of Canada endure, she said: "Let us fight unto death for our country and our faith. Remember

(*Concluded on page 12*)

En Tour in China

Concluded from page 9

gap or outlet for the boats to pass. As we reached the first of these, the boatman used his pole with great strength and deftness, at the same time shouting quick commands to his son. Looking at the great boulders on either side in the current ahead, we shuddered and held our breath: the gondola creaked, quivered and darted over the cascade to the lower water level, some four feet below. Within the next two hours, thirty-six more miniature waterfalls, with their accompanying thrills, brought us to more peaceful waters where pike poles gave place to paddles.

During our stay with friends in Yu Hsien, there was almost incessant rain, so that on the afternoon of the third day when we stepped aboard a large native sampan, the swollen stream carried us ninety li (thirty miles) in three hours. Finding a hotel and requesting an upstairs room, if any were available, we were asked if the foreign lady could climb a ladder. Very glad for the prospect of getting up and away from the dampness and mold of the dirt and stone floors, we were escorted to the loft where a large quantity of cowhides and horsehides was stored. Some of these were removed and others were stacked up to afford room for our occupancy. But the odor!

Arising long before daylight, we folded our bedding and partook of a hastily prepared breakfast. With a suppressed shudder we climbed into our chairs.

In a land of estimated, not measured, distances, one hundred li was given as the mileage to the little town on the Lei River that we planned to reach by nightfall: but that May day was exceedingly hot, and the li, in the language of our coolies, were "very long." At 5 p. m., while we were passing through a vast, uninhabited region that produced little except dwarf pines, our chair bearers gave evidence of much fatigue and suggested that we camp for the night in the wilderness. But after a half-hour's rest and refreshments at a little desert roadhouse, a promise of extra pay induced them to complete the journey. From hotel to hotel we went seeking lodging, but at "New Earth" (Hsin Shi Giai), as in Bethlehem of old, there was no room in the inn.

At length, passing the most substantial looking store we had observed in the town, I entered, and telling the proprietor our situation, asked if he had any suggestions. With true oriental courtesy and apologies that he had nothing better to offer, he invited us in, and escorting us past huge vats and tanks of vegetable oils—his establishment being a large wholesale oil depot—and through numerous hallways and storerooms to a spacious, well-ventilated room in the rear, we were soon made very comfortable for the night. On awakening in the morning, what was our surprise to look out of the door upon a little quiet, private courtyard with numerous well-trained plants and flowers. A little later, our generous host sent a tray of steamed rice, fried eggs and wheat cakes. After a few hours on a small sailboat we reached Lei Yang and met one of my former students, Mr. Wang (translated King), who pressed an invitation for us to visit his mountain home, ten miles distant. We accepted, and a few days later he provided sedan chairs with which to make the ascent of some two thousand feet. On our arrival we were greeted by a large company that had gathered about the group of farmhouses. Through a massive brick archway and across the courtyard to rooms that had been prepared for us, our friend led the way. Crowds eagerly followed, standing about the doors and peering in through the windows. Why should we censure them? Never before had a foreigner set foot on that mountain range and but few of them had ever seen a white person. A visit from an American and his wife was indeed a notable event. After numerous strangers had been introduced to us as "Mr. Wang," or "Mrs. Wang," I turned to my friend with some astonishment, saying, "How many Mr. and Mrs. Wangs reside here?" He replied, "In our family there are about 600, but reckoning all the families of the Wang clan together, there are nearly 10,000," adding that the clan owns a tract of mountain land, seven miles in length and three in width, while scattered about here and there are the family villages with several hundred or possibly a thousand dwellers in each.

Following a suggestion of our host to visit other parts of the compound, we were soon off for a tour of inspection. The antique predominated. On either side of the large central lobby were ponderous, wooden benches weighing several hundred pounds each, said to have been carved from an oak two centuries ago, yet showing no signs of weakness or decay. Some apartments disclosed furnishings both meager and plain, while others revealed a wealth of oriental art and luxury. In various private shrines, ancestral tablets were displayed and gilded images of Buddhist and Taoist worthies grinned or frowned upon us in all their ugliness. From their accustomed places in other rooms the gods and goddesses had been removed by occupants who had learned to love the Christ: in exchange for these symbolisms of heathenism appeared a Gospel scene, a Scripture motto, or a Ten Commandment chart.

Our visit ended, several sturdy "Kings" bore us safely down the mountain slope and through a picturesque country to a river town, twenty miles away.

The Cowboy as Ballad Maker of the West

Concluded from page 7

among those who lived on the plains in the early days and could sense more fully its wild, weird note, affords a curious instance of the way a snatch of sentiment sometimes will catch hold of the imagination and be passed along as a folk song. Remember the words?

> O, bury me not on the lone prairie
> Where the wild coyotes will howl o'er me,
> In a narrow grave just six by three,
> O, bury me not on the lone prairie.

But all the songs of the cowboy are not in melancholy vein. Many of them are stories of exploit, Professor Lomax said, and breathe of the reckless, dauntless spirit of the cowboy and the devil-may-care attitude he developed by taking things as they came. Some of the songs express a certain sympathy for the outlaw, and students have remarked here a similarity to the ballads of Robin Hood. Humor, too, is found among them, and nearly always the roughriding virility of the life the cowboy led. For instance, here is a characteristic bit from one of the songs which Professor Lomax found to be a favorite:

> Whoop ti yi, git along, little dogies;
> It's my misfortune and none of your own,
> Whoop ti yi, git along, little dogies;
> For you know Wyoming will be your new home.

Quite as interesting is a song written originally by Baird Boyd and repeated with variations all over the West. The first verse starts off in this rollicking fashion:

> I'm wild and woolly and full of fleas,
> I'm hard to curry below the knees,
> I'm a she-wolf from Shamon Creek,
> For I was dropped from a lightning streak,
> And it's my night to howl-oow—whoo-pee!

Those first two lines, I venture to say, have become a part of the folk literature of three-fourths of the boys of the West, if we may, by stretching a point, so designate the snatches of song and verse they sometimes pick up and pass along by word of mouth, often with variations of their own. The song itself is familiar to many, but those two lines have become practically common knowledge.

The cowboy has been much misunderstood and caricatured, according to Professor Lomax. Much fiction written about him and filled with drinking, shooting and blood-curdling episodes, he holds, is entirely misleading.

"Owen Wister has given us perhaps the best picture of the cowboy in 'The Virginian,'" he said. "In my association with cowboys, I have known many men just as big-hearted and just as courageous, with just as fine an attitude toward women. The cowboy, rough sometimes and lacking in polish, has an innate sense of chivalry.

"To be a cowboy, a man had to have a splendid physical equipment. He had to have courage. The life of the cowboy in the early days was ten times as dangerous as almost any other occupation. Think of riding full tilt over a prairie dog town and roping a steer! A cowboy was expected to be able to rope and throw a 1,000-pound steer out on the range alone.

"Many cowboys were young men from good families who had grown tired of the conventions and wanted some freedom. There were second, third and fourth sons of English families in search of adventure. Some were young men who had become tired of college. Of the families I knew in Texas, the most aggressive fellows always went West and became cowboys. They were the best type of their time.

"Names didn't matter, but what a fellow could do. There is a line in an old song that illustrates a fairly common trait: 'My name is nothing much, so that I will not tell.'

"Many of our leading citizens in the Southwest are former cowboys. The life of the cow-puncher was a hard school, where only the fittest survived, and many good men have come out of it. For instance, there was a man who gave the University of Texas $2,000,000 the other day. He went 'up the trail' some thirty times."

The cowboy was an important factor in the civilization of the West. Some authorities attribute its conquest more to his influence than to the gold seeker and the soldier. Certainly he contributed an element of virility to our composite national character. So it is worth-while to record the songs and ballads which are so much an expression of himself. Roosevelt was especially appreciative of the songs and gave Professor Lomax some assistance in his work.

The cowboy is passing. The big ranches are being broken up for farms, and the practice of "going up the trail" long ago was ended with the opening of the country to settlement. Cowboys of very much the same type still exist in many sections of the West, Professor Lomax says, but the number is decreasing.

"We don't appreciate the cowboy fully now," he said. "Perhaps we are too close to him. There is a curious difference between the East and the Middle West in this, for instance. I have talked about the cowboys and their songs at Yale University, when there would be at least a thousand boys practically hanging on my words. All through the East, I find the same interest in the cowboy. But take a university out in the Middle West, and the crowd nearly always is smaller, and the majority will be women. The West is too close to the cowboy yet."

Marie de Vercheres: a Heroine of New France

Concluded from page 11

the lessons our father has taught us, gentlemen are not born but to shed their blood in the service of God and the King!" and placing a soldier's helmet on her head, she disposed her little garrison to the best advantage. Her only plan was to keep the enemy from learning how really defenseless was the fort. Therefore she gave orders for the cannon to be fired, more for the moral effect than with any hope of direct results; and she sternly ordered the women to cease their lamentations, since no sign of weakness must be allowed to get to the besiegers. Meanwhile the boys and the soldiers kept up a steady musketry fire from the loopholes.

During the day a canoe containing the Sieur Fontaine and his family was seen approaching the landing-place. They were returning from Montreal, and if allowed to land without warning would most assuredly fall into the hands of the waiting Iroquois; so Magdelaine herself decided upon a bold stroke. Ordering the servant to stand guard at the entrance, and leaving instructions that if she were killed the gates were to be closed and the fort defended to the last extremity, she took her musket, and still wearing her helmet, strode down to the river's edge. The audacity of the move was its safeguard. The Indians, suspecting some trick, allowed her to escort her friends within the fort in safety.

The condition of the defenders was serious at all times, but during the long hours of darkness the advantage would lie heavily with the enemy. As night came on, to make matters worse, a violent storm of wind accompanied by snow and hail came up. Truly the situation of the little band grew more desperate hourly. But the courageous little captain was still undismayed.

"God has saved us today from the hands of our enemies," she addressed her little force; "but we must be careful not to be caught in their snares tonight. For my part, I wish to show you that I am not afraid. The two soldiers, La Bonte and Salhet, will take Lafontaine and the women and children to the redoubt which is the strongest place. You have nothing to fear; and I bid you not to surrender the place even if I am taken, cut to pieces and burnt before your eyes. I shall guard the fort with the youth of eighty, who has never fired a gun, and my two brothers."

The "youth" of eighty! Even the imminence of the great danger which threatened could not stamp out the tendency toward mirth; could not daunt the high spirit inherited from a race accustomed to accept the decrees of fate with a jaunty indifference, be they ill or fair. She took her place as sentry upon one of the bastions, assigning her brothers and the old man, respectively, to the other three. Throughout the night the lurking Iroquois must have no occasion to think that the garrison slept; at regular intervals the sentries challenged the night with their call, "All's well!"

This seeming vigilance on the part of the "garrison" deceived the Iroquois, who, as they admitted later, had made preparations for an attack during the darkness. But the night was not entirely without incident. Some little time after midnight one of the sentries cried out, "Mademoiselle, I hear something approaching." "I left my post to join him," says Magdelaine in an account of the affair which has been preserved, "and through the darkness, aided by the reflection from the snow, saw a group of horned cattle, the remnant which had escaped from our enemies. My first impulse was to open the gate and let them in; but, being well aware of the tricks of the savages in covering themselves with the skins of animals I determined to wait. After having satisfied myself that there was no danger, I called my two brothers to my side, and each with musket in hand stood ready to fire, as I opened the gate and let the poor cattle in."

The first night having been passed in safety, Magdelaine was more determined than ever to hold the fort at all hazards. If the Iroquois realized how poorly Fort Verchères was defended, they would probably assume the other forts along the river to be similarly weak, and doubtless would not cease their depredations until they had ravaged them all. During the second day another opportunity occurred for Magdelaine to prove her audacity, and at the same time continue to mislead the watchful Indians: she remembered that a considerable quantity of linen had been spread on the river bank a few days previously to bleach. Supported by a "barrage" from the cannon on the bastion, she and her brothers marched to the river bank, gathered the linen into sacks and bore their bundles back into the fort, again under the eyes of the enemy. This exploit was undertaken in no spirit of foolhardiness. Aside from the value which the moral effect of the act had upon the Indians, the saving of the linen was a matter of particular importance: all the household linen and wearing apparel of the colonists was spun and woven by the women and, besides representing much labor, was of great value and practically impossible of early replacement.

By the maintenance of sleepless vigilance, the defense was kept up for eight days and eight nights. Early in the ninth day, however, the sound of boats on the river was heard, and in answer to Magdelaine's challenge, the joyful intelligence was borne back to the well-nigh exhausted defenders that succor was at hand. It was a detachment from Montreal, an officer and 40 men. As the officer stepped on the beach Magdelaine saluted.

"You are welcome, Sir," she said; "I surrender my arms to you."

"Mademoiselle," said he with a courtly air, "they are in good hands."

After they had marched into the fort and the officer had inspected the slender resources of the defenders and expressed his admiration, the heroic girl relinquished her charge.

"Kindly release my sentries, Sir, that they may take a little rest, for they have not left their posts for eight days," was the request of Marie Magdelaine de Verchères.

Writes Books for Boys; Lives Boy's Life

Leslie W. Quirk Who Has Done Juvenile Fiction for Twenty Years Says It Is "Hard Work"

The home of Leslie W. Quirk, Madison, Wisconsin, the writer of fifteen books and more than 200 fiction stories about boys.

LESLIE W. QUIRK

By

FRED L. HOLMES

IT WAS at an athletic meet. Thirty high schools of the state had sent their young Spartans to the public competition. It was unlike a great college football game, where the spirit of rivalry is divided between two groups. Instead there was a score of teams vying for honors—youthful discus throwers, runners, pole vaulters, hurdlers, high jumpers—the whole gamut of spring athletics.

Youth carries an intensity, a sort of a spirit of heroic martyrism, into its contests. The enthusiasm of the crowds inspire; the waving plumes and ribbons of gold, purple, white and blue of the schools lure their contestants onward—to win.

Beside me on the bleachers sat a youthful looking man of probably forty years, who was absorbed in every detail of the events. His muscles grew tense as the runners neared the finish; his eyes glistened as the hurdlers sped down the field evenly over gate and box, and the spirit of enthusiasm broke into cheers when some diminutive youngster would carry off the prize over his taller and more clumsy competitors.

"That's the story writer for boys," nudged my companion as he saw my interest in the individual.

Leslie W. Quirk, for twenty years a fiction writer for boys, gets the material for his stories from the boys themselves. He writes about boys because he lives a companionable life with active, robust, spirited, normal boys, who love the contest of athletics, the hike into the woods, the camp fire and the spirit of friendly rivalry. Out of this chance meeting at the high school meet grew my acquaintance with Mr. Quirk.

One drawer in the desk of the author at his picturesque Madison, Wisconsin, home contains a package of treasured letters. Most of the envelopes are written in an uneven hand. The inclosures tell a story of enjoyment and inspiration that would encourage any author. They are boy correspondents, some in high school, some in college, who are asking for more literary thrills from the cinder path, or another dramatization of the freshman crew race. To their youthful imagination the author must be like a Grecian hero, garlanded with the laurel of athletic honor.

Nor are these boys mistaken. In school and university Leslie Quirk was an athlete, one who saw himself thrust aside to play second on the football team because of his diminutive size and his slender, spindling appearance. Out of the burning desire within himself to be a great athlete grew the heroic boys of his books, who break records on the fourth down in football or the third strike at bat.

"I write stories for boys because I know more about that type of fiction than any other," Mr. Quirk told me. "It is not literally true that I began doing that at the outset, but I should. For something like a year, while I was in school, I turned out intimate yarns of royalty and love and crime and business before I pulled up short and did some intensive thinking.

"I reasoned it out like this: 'You're only a school boy yourself, Quirk, and you know exactly nothing about kings and passions and crooks and dollars. Some of the stories sold, yes, but that was probably because the editors were in the same blissful state of ignorance. Isn't there something and somebody you really know?' I asked myself.

"Well, there was. I was a normal boy and I knew boys. I knew how they felt when they faced danger, or temptation, or some problem of life that had to be solved. So I wrote a juvenile yarn about a foot race. I wrote it from the heart. I crammed into it a lot of the emotions I experienced when I ran a race myself—the queer fancies about the cinder track rolling like a ship in a storm, the conviction that the runner has taken his last possible stride and is about to die, the insane hopes and fears about becoming a hero or a rank quitter before all the fellows who are watching.

"I made two copies of the manuscript because I resolved secretly to start at the top of the juvenile magazines and work down to the possible purchasers. One copy went to the *Youth's Companion* and one to *St. Nicholas*. Both bought the story. Right at the beginning of what I termed my literary career I was in disgrace.

"But I weathered that storm, thanks to the big-heartedness of the editors, and kept on thinking about the juvenile field and experimenting occasionally while I evolved my philosophy of writing. In the end I resolved to concentrate upon stories for boys. First, I liked writing about them and for them; it was just as much fun to work out the intricate details of a football or baseball game as it was to sit in the bleachers and watch one. Second, writing for boys paid in a strictly monetary sense. Such stories were easier to write; they were easier to sell, owing to less competition in the field; they brought better prices than stories of equal merit for adult readers; they were grist to the mill of a later book, thus commanding two prices. The story about the foot race, by the way, appeared later as a chapter in my first book, 'Baby Elton, Quarterback.'"

Although it was written nearly twenty years ago, this first volume is still selling and the royalty on the book in the last six months amounted to $96. In spite of the fact that the rules of the athletic games have changed, boys still read this story, because of the breathless interest of the hero in a tight pinch or the suspense that comes to the boy nearly at the goal of success.

"Where did you get your training to write?" I asked.

"I tried to be practical in attacking my problem of writing for a living," he replied. "I went at it in an honest, unemotional, common-sense way. While I was at the University of Wisconsin I worked on a local paper and covered the athletic games. That was probably the start. Then I went to Ohio for a year. From 1903 to 1908 I published in New York a trade magazine for writers and conducted in connection with it a literary bureau, which required me to read and criticize personally more than 5,000 manuscripts a year. That was a part of my education in learning to write. Any person who reads a hundred manuscripts a week, of which perhaps ninety-five are hopelessly unsalable, and attempts to explain just why they are lame and halt and just how they may be straightened and taken apart, and put together again on the operating table, at least learns something about plot and structure and style, if only by the process of elimination."

There were in New York at that time several other young Wisconsin people who had gone to school with Mr. Quirk. Horatio Winslow, who later was to win fame for his African stories; Mrs. Honore Willsie, who became editor of the *Delineator* and author of far-western tales; Charles Tenney Jackson, who was to find his field in writing Louisiana treasure-trove sketches, and Berton Brailey, who was to demonstrate to the literary world that there was still a field for the poet, were then striving for literary fame. Occasionally they met and the social intercourse with his old schoolmates became to him a staff of encouragement.

"Just what sort of stories do boys enjoy?" I asked, anxious to keep up the conversation.

"The story for boys is necessarily a moral story, which is entirely different from a story with a moral," he continued. "It must please the boy for whom it is written, the parents who guide his reading and the editor who buys it. That is a nice equation, but not as complex as it sounds. At heart most boys are honest and clean and possess a keen sense of right and wrong.

"It is a trite truism, of course, that the boy reader imagines himself the hero in the reading story. But I wonder how many people will accept my theory that the hero in the story is also the writer. In any event, I try to visualize myself as the hero, not as I am in real life, but as I should like to be. My central character is really proxy for reader and writer alike, and we are pleased and proud of ourselves in direct proportion to his successes.

"For that one reason, the hero must be a real boy. My reader and I aren't sissies, goody-goodies or mamma's boys; neither are we out-and-out villains. The hero must be a normal youngster, but he must also have the inevitable weaknesses, faults, wrong ideals and the like, else I find no peg on which to hang plot. And one point more, while I'm preaching: I am proud of the fact that in my fifteen books and two or three hundred short stories I have never written a story for boys in which any character was thoroughly bad. No matter what reforms the action of the story achieves, no matter what bad ends wicked kids may reach, I realize that I can never hope to erase the contamination spread to the reader by such characters. In my stories there 'ain't no such animile.'

"My best stories, I think, are those in which the action arouses dormant qualities in the hero. In visualizing the courage motif, for example, I stress the fact that the truest courage is that founded upon the fighting back of fear, upon the overcoming of fear to accomplish some definite result."

Mr. Quirk tries to know the heart of the boy through acquaintance. He realizes that the boy is reaching for the branches, just a little ahead. So, many of his stories deal with the life of boys in college and with their sports.

There are no athletic games that do not interest Mr. Quirk. He will watch the playing of pool by the hour, or take his car and go out in the country to witness some crossroads ball game. Where the boys play in numbers, there he will be found.

While there is greater opportunity to dispose of literary productions by living in New York, nothing can quite compensate the compelling human interest in a college or university town. It was for this reason that Mr. Quirk left New York and returned to his old home near the University of Wisconsin.

"There are many advantages in living in New York, where the publishers of magazines can be frequently met," continued Mr. Quirk. "Editors have their peculiarities as well as boys. When you come to know them, you come to realize the character of contributions they desire. It used to be quite a joke among some of the writers that a story that portrayed a child as one of the leading characters always found a ready buyer with one editor, while another was always anxious that some animal play a part in the plot."

"Writing fiction is just like any other employment," said Mr. Quirk. "It is hard work. It is fascinating work, but there is a certain routine to it. I study the magazine field, know what the editor is looking for, and then attempt to supply a part of his demand. Not long ago, Horatio Winslow and I decided to study the magazines and collaborate on a series. We wrote one hundred and three fiction stories in one year and sold all but three."

How Coolidge Made History in Bay State Politics

Concluded from page 8

dilemma. He told the men that he favored the increase but that he was in a quandary as to how it could be obtained. The policemen took measures to protect their interests by turning their mutual benefit association, the Boston Social Club, into a union and applying to the American Federation of Labor for a charter.

When Commissioner Curtis learned that a union was being formed, he issued an order disapproving the action and stating that the policemen, in forming a union, were violating the spirit of the oath they had taken as public officials. He therefore ordered that all such activity cease at once; and when the patrolmen-officers of the union refused to heed his demand, couched in the form of an official order, Commissioner Curtis promptly cited the men for trial on charges of insubordination. After a hearing they were found guilty and suspended.

The Men Walk Out

INCENSED by what they characterized as unfair treatment of their spokesmen, the policemen called a mass meeting and proposed to strike. The question was submitted to a vote by ballot, and when the votes were counted, the decision to strike had been carried by an overwhelming majority. The strike was called for 5:45 p. m., September 9, and the policemen's union appealed to every trades union to approve its action by its moral support.

It was Commissioner Curtis' next move. His repeated assertions, made public through the press, that he "had the situation thoroughly in hand" and that the city would be adequately policed if the policemen walked out, dispelled whatever fears timid people had about the city's safety. Curtis was adamant. The strike hour came. The men turned in their badges and revolvers and walked out, leaving on duty only a handful of their associates, who had decided at the last minute not to join the strikers.

The night of September 9, 1919, was a night never to be forgotten in Boston. Except for the captains, lieutenants and sergeants, with the comparatively few patrolmen who refused to strike, the city was left unguarded. Curtis' boast that he had made provisions for adequate protection of life and property had been a bluff. It was said that Curtis never dreamed that the men would walk out; that the proposed strike would be called off at the eleventh hour. Under the constitution of the state, the governor had no authority to act. In the event of lawlessness, the matter was one for the mayor of Boston to handle until such time as the governor should decide that the mayor had failed to protect the public welfare. With the coming of darkness, thugs and thieves, free from the restraints of their veneered civilization, took possession of the city. It was a night of pillage and plunder. Stores were broken into in all parts of the city, men were held up and robbed, women were assaulted, gambling outfits were set up in the streets, gangs of hoodlums trailed through the suburbs, false fire alarms were rung in, and everything that wasn't nailed down was carted away.

A Plot Is Charged

FRIENDS of the striking policemen and representatives of organized labor charged that the failure to police the city with volunteers and guards had been a deliberately preconceived plan to deal a smashing blow to the policemen's cause and to discredit unionism in general. It was part of a gigantic plot by "Big Business" to crush Labor. The union offered to support its contention by an affidavit made by Rev. Paul Harris Drake, a Unitarian clergyman whose church connections had been severed because he had become a liberal in his social thinking as well as in his religion, and who had returned to his former profession of journalism. Mr. Drake had been "covering" police headquarters for an afternoon Boston paper. Mr. Drake said he had overheard conversation which indicated to him that Curtis' failure to police the city, after he had been given ample opportunity and time, was exactly what the union leaders were charging—the result of a prearranged plan to discredit the policemen. When Mr. Drake unhesitatingly stated what he had heard, he was summarily "fired" from the staff of his paper and all efforts on his part to learn why he had been dismissed elicited no explanation. Drake, admittedly one of the ablest news writers in the city, had been satisfactory to his city editor up to the very minute his own opinions and statements of what he had heard had become "indiscretions of a newspaperman."

All through the day of the tenth of September, after a night of pillage and plunder, no concerted effort was made to prevent a repetition the next night of the lawlessness that had shaken Boston to its very foundations. It was true that what was left of the Boston police department was swearing in volunteers to augment the force. But it was a case of "putting it up to Mayor Peters" and giving him nothing to work with.

On September 11 Governor Coolidge issued a proclamation which read:

"The entire state guard has been called out. Under the constitution the governor is commander-in-chief thereof by the authority of which he could not if he chose divest himself. That command I must and will exercise." And in an executive order to Commissioner Curtis, he said: "You are hereby directed, for the purpose of assisting me in the performance of my duty, pursuant to the proclamation issued by me this day, to proceed in the performance of your duties as police commissioner of the city of Boston under my command and in obedience to such orders as I shall issue from time to time, and obey only such orders as I may so issue or transmit."

There was a hurried conference between Mayor Peters and Coolidge and the scene which took place there was said in newspaper circles to have been a "hot session"; but not a word of the rumors which were common talk crept into the news stories of the day. A certain group of the striking police officers, realizing the gravity of the situation which they never foresaw as a result of their walking out, urged their associates that the proper action for them was to offer to return and to help in the task of restoring law and order. Overtures were made for their return and their reinstatement. It was freely reported that Coolidge favored leniency. For a time he dropped from view and could not be located. From certain close supporters of Curtis came word that Curtis and not Coolidge was the man who was staging the "show-down" fight.

Coolidge had ordered out the state guard on the eleventh, and late that afternoon mounted troops were entering the city to rescue it from the reign of anarchy which had sprung up as if in the twinkling of an eye. No one who lived in Boston through those two nights of lawlessness could do other than praise Calvin Coolidge for the manner in which he brought order out of chaos; for no man's property—millionaire's and laboring man's alike—was safe in that maelstrom.

It was whispered about that Coolidge at first seriously considered the proposal that the policemen return to work but that Curtis brought pressure to have the governor back him up in his determination not to reinstate a single man. What might have happened is now only a matter for conjecture. Just when negotiations for the return of the men were at their most critical juncture, however, Samuel Gompers, president of the American Federation, sent a telegram to Coolidge demanding immediate reinstatement of the men and the removal of Curtis.

Whatever hope the rank and file of the men had had for reinstatement was dissipated in a single hour. Coolidge issued a telegraphic reply to Gompers without mincing words, and the text, when it was given to the press, gripped the entire nation—"There is no right to strike against the public safety by anyone, anywhere, any time."

Hailed "Man of Hour"

THERE was much disorder in Boston for more than a week after the state guard had been called out, and it was not until September 24—two weeks and a day after the policemen had walked out—that Coolidge issued his now famous proclamation on which his campaign for re-election was subsequently based. In this proclamation the striking policemen were castigated for deserting their posts.

"The authority of the Commonwealth," said Governor Coolidge, "cannot be intimidated or coerced. It cannot be compromised. To place the maintenance of the public security in the hands of a body of men who have attempted to destroy it would be to flout the sovereignty of the laws the people have made. It is my duty to resist any such proposal of the men. Those who would counsel it join hands with those whose acts have threatened to destroy the government. There is no middle ground. Every attempt to prevent the formation of a new police department is a blow at the government. That way treason lies. No man has a right to place his own ease or convenience or the opportunity of making money above his duty to the state.

"This is the cause of all the people. I call on every citizen to stand by me in executing the oath of my office by supporting the authority of the government and resisting all assaults upon it."

It was a proclamation that shattered the policemen's hope; the straw that broke the camel's back, and Coolidge was heralded far and near as a new "man of the hour."

Political opponents of Coolidge within his own party were prompt to repeat the assertion that Curtis and not the governor was the dominating force behind every move in handling the police strike, and that Coolidge, a mere political opportunist, was "copping off the glory."

Richard H. Long had been nominated by the Democrats, and he at once made clever use of the assertions which friends of Curtis were making. Spurred on by many of the recognized labor leaders, Long announced that if he were elected governor he would reinstate the striking policemen who had been victims of a conspiracy hatched in State street by the money powers. Organized labor appeared to be swinging behind Long's candidacy, and the Republican leaders at state headquarters were becoming thoroughly alarmed at the prospect of a Democratic victory.

The campaign for Coolidge's re-election lacked generalship. Not a man to toot his own horn, Coolidge himself was doing nothing, and the confusion at Republican headquarters plainly reflected the haphazard methods by which valuable time was being lost. Complaint was heard on every hand among Republicans that the "machine" was "laying down on the job," and ugly rumors were afloat that some of the politicians who had always cordially hated Coolidge, were knifing him in the back while pretending, purely for party reason, to be with him.

How Baxter Won for Coolidge

CHARLES S. BAXTER, one of the ablest campaign managers in the state and confidential adviser of Governor McCall, was told bluntly that his services were not needed in the fight. The reason for this lay in the fact that McCall and John W. Weeks, now Secretary of War, had been at swords' points since 1912, when both were candidates before the Massachusetts legislature for United States Senator.

Management of the campaign went from bad to worse. Those who were supposed to be in charge were floundering in the puddle of their own incompetence. Coolidge's prospects were growing gloomier and gloomier. Seasoned politicians were predicting that organized labor would go solidly to Long. And not until ten days before election day did the thought percolate through the Old Guard's collective cranium that it was cutting off its nose to spite its face. "Charlie" Baxter was the one man, the Old Guard agreed, who could pull them out of a bad hole. But it was a bitter pill for the Old Guard to swallow. But Old Guards will do anything to save their political necks.

Would Mr. Baxter take hold of the campaign? He would. Being a practical politician, Mr. Baxter had a certain interest in the success of Mr. Coolidge's campaign. If it had been a matter of saving the Old Guard, the Old Guard could have gone hang for all he cared. Few men in Massachusetts understand crowd psychology better than Charles S. Baxter. He organized a "flying squadron" of twenty automobiles and announced that his speakers were going right to the mill gates in the great textile centers—right into the strongholds of organized labor—and defend Calvin Coolidge's course taken in the police strike as the only course a red-blooded governor could have taken.

Vote for "Law and Order"

"MEET this issue squarely," said Baxter. "The only way we're going to get votes is to put it squarely up to the average man whether he wants law and order or anarchy and destruction. Go tell these men who work in the mills and the shoe factories and the shops that their homes would not have been safe in Boston on the night of September 9. Put it up to them, and I'll bet they'll vote right."

On the afternoon of election day, 1919, the writer was present at Republican state headquarters when John W. Weeks and other optimistic individuals of the Old Guard declared that if Coolidge received a majority of 10,000 over Mr. Long he would be doing well. Up to the last minute before the votes were counted they refused to believe that "Charlie" Baxter knew what he was talking about, and even when 125,000 majority were counted in favor of Calvin Coolidge in one of the most momentous elections ever held anywhere, they were puzzled to understand how the "labor vote" had turned a flip-flop from the path in which it had been bidden by its leaders to go. But there was no mistaking the telltale figures. "Labor" had put Calvin Coolidge across. "Labor" had voted for "law and order." "Labor" had approved at the ballot box what Coolidge had done.

King's Chapel Crams History Within Walls

Concluded from page 3

its foundations were probably undisturbed, and that, together with the communion table and chancel rail with hand-carved pillars, are the oldest still in use in New England. The Bible on the reading desk was given in 1768, and the miter and crown, although put away for safe keeping during the Revolutionary period, still adorn the organ. In the gallery are the pews reserved for slaves, but the narrow one in the rear where condemned prisoners heard service the day before their execution has disappeared.

The governor's pew has lost its canopy and the visitor today is more likely to be interested in those of Oliver Wendell Holmes, Charles Sumner, Presidents Eliot and Lowell, and where George Washington sat, when, in his uniform of a Virginia colonel, he came to inform Governor Shirley of the death of his son, and where later, as President of the United States, he listened to a concert in his honor. The clock in the rear was presented by Lieutenant-Governor Oliver and the bell was brought from England and recast by Paul Revere and his son.

One of the most interesting of the monuments is that of Samuel Vassall, the first to resist the tax of tonnage and poundage, and son of that Vassall who, at his own expense, fitted up two ships to fight the Spanish Armada. In one corner of the tiny churchyard, at the front, is buried in what was once the strangers' tomb, the Chevalier of Saint Sauveur, who was killed in a street riot during the Revolution. Congress at that time voted money for a monument, but in those troublous times it was not erected. About fifteen years ago some historian, poring over the dusty volumes, came upon the record, and so it happened that the Chevalier at last got his monument with the long inscription in French upon it, composed at the time by some devoted friend.

Adjoining the church is the burial ground, the oldest in Boston, dating from the very time of the settlement. Here lie buried Governor Winthrop, his sons and grandsons, Robert Keayne, the first captain of the Ancient and Honorable Artillery Company, whose tombstone is his doorstep, and Thomas Bromfield, who built the first organ in America. Here lie also Mary Chilton, who, according to tradition, was the first to land from the Mayflower, Lady Andros, and Elizabeth Pain, who was perhaps the Hester Prynne of Hawthorne's "Scarlet Letter." A horizontal stone informs us that "here lyes entombed the bodyes of ye famous reverend and learned pastors of the First Church of Christ in Boston," and then follows a goodly list of names with John Cotton at their head.

Wisconsin's Electric Legislative Roll Call

Designed by Milwaukeean, Machine Speeds Voting and Prevents Disputes

View of the desks of the members of the Wisconsin assembly where the first electric device in the world was successfully installed.

THE Wisconsin legislature through four sessions has demonstrated the feasibility of voting by the electric signal. It is the only legislature that has installed such a device, although both the states of Iowa and Illinois now contemplate such an innovation. The electric roll call is the greatest time-saving device that has been invented to solve the delay and complexities of modern lawmaking. It performs in the fraction of a minute the work of calling a roll of 100 members that formerly took from six to ten minutes.

Statisticians have estimated that the expense of taking a roll call in the House of Representatives at Washington is close to $1,000. Should Congress install the electric voting device as used in the lower house of the Wisconsin legislature it is likely that the cost would be reduced to $25.

Necessity proved to be the mother of the electric voting device in the Wisconsin legislature. Members of the 1913 Wisconsin legislature endured upward of 850 roll calls, averaging six minutes each—seventeen legislative days of five hours each frittered away through the slow revolutions of an obsolete voting process. This legislature voted to install the electric voter.

At the close of a hot day's session of the Wisconsin legislature in 1911, C. E. Shaffer, the veteran chief clerk of the house, explained to the members that he believed the tedious process of calling and recalling the names of members, to record their votes on measures, could be obviated if someone would invent a system to signal the clerk's desk the way the member desired to vote.

Listening to the conversation was a little, dark-haired, nervous man, who had always been dabbling with signal devices. The suggestion kindled his imagination.

"I'll solve the whole process before the next session of the legislature," remarked B. L. Bobroff, the Milwaukee engineer, who had overheard the conversation.

Back to the 1913 session came Engineer Bobroff with an electrical device which he claimed when installed would accurately record the votes. For weeks members of the legislature tinkered away at the little toy which he had worked out. The session was prolonged into early summer. The days were growing hot and the roll call of names droned over and over was becoming monotonous.

Then one day, toward the close of the session, a bill was rushed through to appropriate $12,000 for the installation of the electric device. The legislature thought the suggestion was worth a trial.

That was the beginning. Wisconsin had just completed its $8,000,000 capitol building, with its sumptuous assembly chamber. How to work out a simple machine that would give the chief clerk an accurate record of every member's vote, without marring the architectural beauty of the assembly hall, became a problem for the inventor. He solved it.

Engineer Bobroff was ready for the 1915 session of the legislature. The intricate mechanism had been installed. He was ready to give a complete demonstration of the feasibility of his voting device. From the first day it worked like a modern cash register. It seemed almost human in its accomplishments.

Two years ago some small improvements were made in the mechanism, but the system now in use is the one designed for the session eight years ago.

In operation, the electric roll call is simplicity itself. When a roll call is announced by the presiding officer, the chief clerk instantly makes the vote register ready for active use by switching on a recording device.

On the desk of each member of the assembly is a little box locked by a Yale key. Only the member who holds the key for the box can unlock it and the individual voting device on the member's desk will not operate until unlocked. This safeguard was taken to prevent one member voting for another during an absence.

When the presiding officer announces a roll call, and the chief clerk switches on the mechanism, the members by pushing a little button in the electric wired box on their desk can vote. By pressing the electric button once, a "yes" vote is recorded; twice a "no" vote and three times the member records himself as "paired."

High up on the wall, occupying space formerly used as a part of the gallery, is a bulletin board, so that every person can see how the members have voted. On this bulletin board are the names of the legislators. Three little electric lights are imbedded after each member's name. These lights are connected with the desk of the member. When a legislator presses the electric button on his desk once, a white light appears after his name and is known as a "yes" vote; two presses of the button a "red" light, or a "no" vote, and three presses of the button a "blue" light, which indicates that on this roll call the member is "paired" with some other member who is absent.

That there may be no mistake as to how a member has voted, there are three similar lights imbedded in the box on his desk which show the same color electric signals registered on the bulletin board.

The bulletin board, or vote register, on the gallery wall is an interesting piece of mechanism. The back side of the board has a duplicate list of the names. When the "white" light is flashed on the side of the bulletin board to public view for a "yes" vote, on the opposite side after the member's name appears the letter "Y," which has been brought into view by the appearance of the "white" light. Similarly an "N" appears for the red light, when a member votes "no" and a "P" after the name of the members who vote "paired." If a member makes a mistake in voting or wishes to change his vote, he can do so by simply pressing a button, which registers his real intent without waiting or wasting time.

After allowing the time set for voting, the speaker announces that the roll is closed and the chief clerk turns off the mechanism, which automatically locks the vote, no further changes being possible without the clerk's again engaging the device.

Immediately, a photograph is taken of the side of the bulletin board opposite from public view. This photograph becomes the roll call of the house on this piece of legislation. The lights on the vote register are automatically switched off by the photographer after the vote picture is snapped.

On the desks of the chief clerk and the presiding officer are two sets of dials—a "yes" and a "no" system. As the members press the buttons on their desks and the little "white" and "red" lights appear after their names on the elevated register, each vote is being registered and counted on these dials on the desks of the presiding officials. If there were twenty-five members who voted "yes," an indicator would move over to "25" on the "yes" dial. Meantime, if forty-one members were voting "no" the indicator on the "no" dial would move over to "41." That is, the computed vote and the photographic record that is taken on the bulletin board is the picture result.

Assuming that all members pressed their voting buttons instantly and together, it would be possible to take, count and permanently record by photograph the vote of the 100 members of the house within twenty-five seconds. The actual record, day in and day out through the session, is less than a minute for each roll call.

Chief Clerk Shaffer, who had years of experience in calling the rolls and recording the members' votes before the installation of the electric register, declares that the new system is more accurate. It prevents errors due to faulty hearing of responses, or mistakes in printing or adding.

Moreover, the electric system of voting prevents the legislative expediency for delay known as the roll call filibuster. There is no time, once the key for voting has been turned on by the chief clerk, for hemming or hawing, so common in the vocal roll call—no opportunity for extended remarks in explaining votes.

Members of the legislature take as much interest in watching their votes recorded on the bulletin board by the electric process as do the visitors.

"The question is, shall bill 250 A, providing an appropriation of $150,000 for a new university extension building in Milwaukee, pass," announced the speaker when this measure was up for voting. "Those who favor the passage of the bill will vote 'aye'; contrary, 'no.' The clerk will prepare the roll."

"Click—click—click—click," is heard from the assembly floor after the chief clerk has turned on the mechanism. As they vote, the members look at the light in the box on their desk and then to the bulletin board to see that their vote is recorded.

"Have all voted?" asks the speaker after several moments have elapsed and the bulletin board appears in its lighted colors of red and white lights.

"I declare the roll closed," he continues and the chief clerk turns off the switch. For a moment the clerk and the speaker examine the dials on their desks.

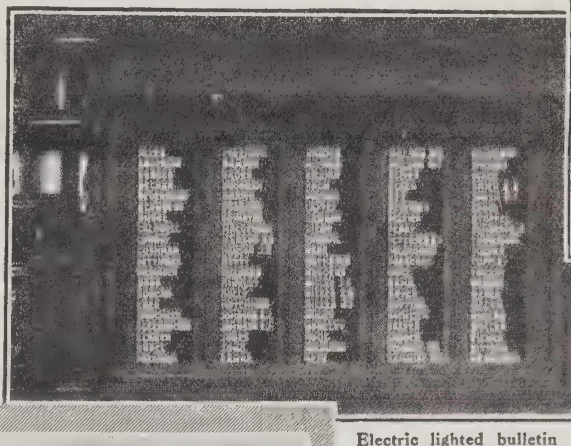
"Ayes, forty-one; Noes, twenty-five, and the bill is passed," announces the speaker, and the chief clerk instantly begins the reading of another measure for consideration. Everything moves with electric rapidity.

C. E. SHAFFER,

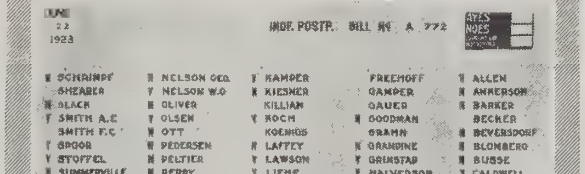
Veteran chief clerk of the Wisconsin assembly, whose suggestion led to the inventing of the electric roll call.

B. L BOBROFF,

Milwaukee engineer who invented the electric roll call used in the Wisconsin legislature.



Electric lighted bulletin board in the galleries which shows how each member has voted on the roll call.



A recorded roll call of the Wisconsin assembly on the indefinite postponement of bill 772 A taken on June 22, 1923. The recording of this roll required less than a minute of time. "N" before a member's name means "no"; "Y" means "yes" and "P" means "paired." Members not having anything written before their names were absent when the roll was taken.

URBANA ILL

BRIEFLY TOLD

Bootleggers of New York City are offering for sale, at one dollar a collection, photographs of all prohibition agents stationed in the metropolitan area. The wary bartender, after carefully examining the pictures on the circular, can easily guard against arrest. Circulars are kept up to date and subscribers are supplied with photographs of new agents, or informed of any transfers on the force.

Indian chiefs in their dealings with the United States Government now use the finger and thumb print instead of their witnessed mark. This applies only to those Indians who cannot read or write.

Speed in travel appeals to the Chinese and thousands of Chinese take joy rides simply for pleasure. It is no uncommon thing for a poor coolie to spend his last "cash" on an automobile ride that leaves him stranded many miles from home. He is glad to trudge back complacently and is satisfied in his own mind that his money has been well spent.

San Juan County, Utah, is located in the southeastern corner of the state. It is larger than the entire state of New Jersey and the last census gives the population as 3.379. Much of this country is unsurveyed and consists for the most part of a great expanse of red rock, carved into innumerable canyons, buttes and fantastic promontories. Some of the remote valleys contain grass and water but the greater part is desert formation. Many of the canyons have never been explored by white men. The first of the natural bridges in this country were visited by white men as late as 1903. This district was the scene of the recent Ute uprising. It is the last frontier.

An immense dam is being thrown across the Dix River near Burgin. Kentucky, which when completed will be the highest dam east of the Rocky Mountains. Two auxiliaries are now under construction which will generate more than 125,000 turbine horse power.

The Chinese buy thousands of tons of our daily newspapers each year and use them for wrapping purposes.

When Harry H. Kabotchnick presented a petition in Philadelphia to have his name changed to Cabot, objections were made by counsel for the Pennsylvania Society of the Order of Founders and Patriots of America. Assumption of the name, it was argued, would "mislead persons as to the origin and ancestry" of the petitioners. The court held the petition under advisement.

The giant Sequoia, thirty-two feet in diameter and 280 feet high, which is the second largest tree in the world, was dedicated to President Harding's memory as the Warren Harding Tree. The giant redwood is 5,000 years old and is second in size to the General Sherman Tree.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

"To re-establish the Constitution of the United States and the principles and ideals of our government in the minds and hearts of the people," the American Bar Association is planning a Constitutional Week, September 16-22.

By dint of hard work and heavy taxation, Czecho-Slovakia is one of the few European states that is in a sound financial condition today. In 1922 the country's trade balance was favorable by 5.390,000,000 crowns, compared with 4,877,000,000 crowns in 1921.

Six thousand tons of Alberta coal will be sold in Toronto at $12 a ton. This price compares with $15.50 asked for United States anthracite there, or $3.50 less a ton.

Waterbury, Connecticut, wins questionable publicity in the recent announcement that during June of this year, as compared with the same month in 1922, the number of work permits granted for the employment of children in industry increased 800 per cent.

President Obregon, of Mexico, says, "My international creed is that of world peace and international brotherhood. I believe that war should cease forever, and that we should cease to emphasize national lines and understand that we are all brothers."

The Japanese Parliament is modeled externally upon that of Great Britain, but its spirit is entirely different. In Japan, debates in Parliament are pleasant occasions where men of second rank are permitted to display themselves. The leader of a party may not even have a seat in the chamber.

Believing that the thousands of visitors received by President Harding did much to break down his health, the American Philatelic Society recently canceled an engagement to shake hands with President Coolidge. This custom of setting aside an hour daily for the reception of visitors frequently brought to the White House as many as 1,200 persons a day to shake the President's hand.

William Allen White in the Emporia *Gazette*, says, "Until the farmer has learned the organization game, the game that fixes prices and gives up its independence for the right to prosper, the game that all the world has learned in the last 200 years, the farmer's cake is dough."

Pack horses used in the Canadian Survey party which mapped the land north of Athabasca Landing, Alberta, did not need to be taught what a smudge was for. The moment it was started they crowded up into the smoke to escape the tormenting flies. This made it easy to round them up for the next day's journey.

Hazing will be permitted at the University of California, provided the hazers observe the rules of good sportsmanship. Full responsibility for any excesses will be placed upon the shoulders of the student body. Approximately 3,000 freshmen will register at the university soon.

The German fleet that was scuttled at Scapa Flow is to be raised, cut up, and sold for junk.

Edward W. Edwards, of Cincinnati, says, "The bigger you are than your work, the easier you will find it, and the swifter will be your progress in it. Certainly others will be attracted to help you along, or buy whatever you may have to sell in goods or services, in the measure that you are an all-round human being—big, broad, and kindly—and not simply a machine, as a man always becomes who permits his work to master him."

Enginemen on locomotives when going through a tunnel frequently encounter heat ranging as high as 136 degrees with smoke and moisture-laden atmosphere often filled with deadly carbon monoxide gas. The Bureau of Mines has experimented with gas masks for use of cab crews, and has perfected a small pocket respirator for quick use when in a tunnel. A more satisfactory method for combating the gas is to supply fresh air to the men from the air brake system on the train. A rubber tube fitted with a funnel which is held close to the face furnishes an adequate amount of air.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

Dictatorship May Mark End of Mussolini

CHRONICLER OF THE NEGLECTED TRUTH

Who Owns the Money Controls the State

The Hard Story of Our Privately Owned Panicky National Financial System

By WESTERN STARR

CENTURIES of controversy have failed to develop a system of Finance that entirely satisfies public needs. No system heretofore adopted has been permitted to continue in operation for more than a relatively short period. The importance of the financial system has been greatly magnified by the industrial development of the last century. The legal, political and social nature of money; the prominent place it has held in history; the countless experiments made in its manufacture; the utterance of its symbols; the political struggles that have centered on its control; the vast study devoted to its principles by philosophers and statesmen, warrant the most serious study of the subject and the application of scientific methods to the abundant historical material it offers.

The problems of war finance compel the reorganization of existing monetary institutions, and this makes necessary an elementary survey of the entire problem of money, its nature and functions—and of the cognate elements and factors of public finance.

It was expressly set forth in the Constitution that Congress should have power to "coin money and regulate the value thereof, and of foreign coin and fix the standard of weights and measures," the intent as to both money and standards being the same.

As interpreted and applied to weights and measures, this obligation has been duly and fully discharged by Congress. It has fixed the standards of length, weight, volume (both of dry and liquid measures): Congress has fixed the standard of measurement for quantities that were unknown when this duty was placed upon it. Light, heat, energy, physical power, are now measured, bought and sold, by units of measure fixed by Congress, as readily as cloth, oil or wheat.

Politically Free, But in Economic Bondage

THE power of Congress to "coin money and regulate the value thereof" has been held to include the power to issue credit notes or bills as money; and under this power Congress issued credit notes in the darkest days of our history. From our beginning as a nation there has been a constant struggle to get control of and the right to exercise this power of Congress to issue money and regulate the value thereof.

In 1781, the surrender of Cornwallis ended the Revolutionary War. In 1781 the Continental Congress, instead of creating a National Bank, authorized the incorporation of the Bank of North America and gave to it a charter with power to issue money. The bank opened for business in January, 1782.

The ending of the Revolutionary War was one of the supreme events of world history. It was followed by a monstrous anti-climax.

A nation secures liberty and sovereignty for its people by heroic sacrifice and long suffering—only to hand over its greatest treasure, its national credit, to private agencies, to do with as they wish.

The same scene follows the Civil War. That war was fought with credit bills issued by the general government, after the banks of the country had closed their doors and gone into bankruptcy, this in December, 1861. When the war was ended, these same bankers demanded that the credit bills that carried the nation through four years of war must be retired, and that Congress turn over to them the power to issue their own notes as the nation's money; in place of the greenbacks that had won the war. Congress again failed in its duty to the people. It issued no more national credit bills. It destroyed billions of greenbacks, that is, retired them. It once more gave over to private agencies control of the nation's credit to do with as they might wish. Abuses of this power became so oppressive as to threaten the system. In 1908, not satisfied with the power to control national credits and to prop up a tottering structure of railroad and industrial monopoly finance, an attempt was made by the more powerful banks to legalize these monopolies and to institutionalize their private finance by making their stocks and bonds the legal basis for enlarged bank credit and circulation, notwithstanding and probably because these stocks and bonds were merely the capitalized values of the monopolies they possessed.

For the time being, this effort failed. The lesser banks were unwilling to surrender their powers to a gigantic monopoly of monopolies, the credit masters of the nation.

In 1913, after a campaign of educational moral suasion, a measure substantially identical in form, content and purpose became the law. Both of the historic political parties claim credit for this legislation, demonstrating the invisible differences between them, when the interests of the oligarchy conflict with the interests of the people. The Federal Reserve Act was so drawn as to permit an unlimited expansion of credit for an unlimited time, for which, at that time, there was no visible necessity. *Is it possible that American financers anticipated the demand for credit that must follow the entry of America into a World War and foreseen only by themselves?*

Under this law, the Federal Reserve Act of 1913, credit control is so centralized that less than a dozen men hold autocratic dominion over every industry in the land.

The making of bank credit is a very simple process: It is called "money of account"; *a shadow money,* and is a matter of absolute discretion with the banker. A would-be borrower wishes to purchase $100,000 of bank credit and applies to the banker for the loan. If his standing in the commercial world is O. K. and his collateral is satisfactory, the borrower turns it over to the banker with a power of attorney. He also signs a note stating the amount and promising to pay off the loan whenever the banker demands. The power of attorney authorizes the banker to sell the collateral, if for any reason the borrower fails to fulfil every letter of his contract. Considering the bank system as a unit, the borrower puts nothing into the bank nor does he take anything out of the bank. Yet he walks out with a credit balance of $100,000 that he has bought, and the bank calls this debt, this credit, an asset. When he comes to pay off his loan, he pays interest and other charges for credit, or the use of money that was never printed and never existed except in imagination. There was more than $50,000,000,000 of this phantom money outstanding in the American business world in January, 1920, and drawing interest for the private agencies to which our Congress turned over the control of the money functions of our government.

There is another species of credit, or, rather, spurious —pseudo—credit, that has become a part of our public finance: that is, the fictitious capital securities issued by corporations enjoying monopoly privileges. Every dollar of such capital issues that does not represent actual investment, that represents nothing beyond a power to exploit, such as is conferred by monopoly in any form, is a spurious dollar. Yet under our system it travels on all fours with real dollars actually invested. Prices fixed for products of such enterprise are arbitrary—bear no logical relation to cost of production and are a constant drain of unearned wealth from industry.

The raw material of credit is the faith and confidence of the people. Its machinery and equipment is the sovereign power of the people, through Congress, to issue the people's money and regulate the value thereof.

The menace and effects of the present false system of public finance is fairly illustrated by the consequences of its abuse in 1907. The usual, ordinary and regular practice culminated in a perfect example of a hand-made panic that year. The facts of that episode in American public finance are on unchangeable and unchallengeable record. It was the year preceding the national election of 1908. There had been several years of expanding business following the Spanish War: large enterprises had been set going and still larger plans were in tow.

The Spanish War bonds had produced the natural inflation of currency—augmented the volume of money; price levels had gradually risen to keep pace with an increased volume of money. The circulation of money had increased velocity. An ambitious soldier of fortune, an adventurer on the seas of politics, was President and his eyes were fixed on the future. During his chief magistracy there had come into being in American industry a colossal monopoly in the steel and iron industry, formed to annul competition and capitalized on the basis of tariff and other monopolies. This enterprise, the United States Steel Corporation, was under the control of the masters of American high finance and American national credits.

How the 1907 Panic Was Staged

THE general conditions of business prosperity had led to the investment of large capital in an iron and steel enterprise in a section of the country outside the control of the United States steel monopoly; a section where all the factors of a successful business offered exceptional opportunities. Ore, fuel, lime, short hauls; and more than these, unlimited, cheap and docile labor.

Early successes and brilliant prospects led to the investment of additional capital, borrowed upon a majority of the securities of the Tennessee Coal & Iron Company. There were indications that the operations of the Tennessee Coal & Iron Company threatened to interfere with the purposes of the United States Steel Corporation to maintain such monopoly prices on steel products as would valorize the floods of fictitious capital in its issues. To insure this it required an impregnable monopoly. The President had chosen his successor for the election year of 1908. The "practical" men, who were the masters of American high finance, had dealt with him as a practical man on other occasions. They knew him for what he was. As a preliminary move, and to avoid local suspicion, they developed a business panic in London. They drew $125,000,000 of gold from London banks, this to fortify their position at home and precipitate credit disorder abroad. Interest rates in London were raised to prohibitive figures, tradesmen were ruined by thousands, and tens of thousands of working men and women were thrown into idleness and acute distress. Credit restrictions in London were the excuse for credit restrictions in New York, and the credit masters immediately proceeded to call loans, cut off credits and to call their loans on the Tennessee Coal & Iron collateral. They pulled the string on the trap they had baited with the lure of continued prosperity and cheap credit. Credit was now unobtainable at home or abroad. General industry became involved: the panic was on.

A rush was made to Washington for help to save the situation. Naturally an ambitious and forward-looking President could not permit his administration to be stained by the calamity of a protracted period of industrial stagnation and a slow industrial revival that would hang over into 1908 to imperil the success of his party or jeopardize the executive benediction of his favorite for the Presidential succession.

There was already $150,000,000 of the people's money in New York banks, deposited by the Secretary of the United States Treasury. This official poured $35,000,000 more government money into the New York banks in less than a week. By December 1, there was more than $250,000,000 of government money in the New York banks to plug the hole of the $6,000,000 loan to the Tennessee Coal & Iron Company. Did it stop the hole? It did not—and every additional million of government money only made it that much larger. Conference and consultation followed, with the President, with the Secretary of the Treasury, with the Attorney-General.

Meanwhile, *more than three billions were wrung out of market prices of Railroad and Industrial securities on the list of the Stock Exchange of New York; thirty billions were squeezed out of the market values of the products of American industry and the accumulated properties of the people. Bread lines, soup houses, were the order of the day in American cities,* while insanity and suicide swept across the nation. Still the masters of high finance, the credit managers of the nation "had done all in their power"; there was nothing more they could do, *unless, possibly they could be allowed to break the law.* Unfortunately, there was a very specific, definite statute that alone prevented their doing the only thing possibly able at once to arrest the stampede of ruin that was sweeping the country:

"Let them take over the properties of the Tennessee Coal & Iron Company, at present prices, and assume their liabilities and they would turn the tide of destruction into a healing stream of prosperity overnight."

Public Finance Becomes Private Property

THE Attorney-General, head of the Department of Justice (and to establish justice this government was created), found it a simple matter to conclude that the safety of the people is always the supreme law, regardless that the first principle of justice insists that no man shall be allowed to profit by his own wrongdoing. He found no obstacle to the course proposed—promised absolution, so far as his official action could go—and the thing was done. The panic stopped as casually and as suddenly as it had begun.

In less than two years (that is merely overnight for high finance), the market values of stock exchange securities were back where they started from in October, 1907. But the equities in thousands of millions were securely in the hands of the bargain hunters of high finance, the credit masters of the nation; who are masters of life and death for the industries and commerce of the people. Andrew Carnegie is reported as saying that he could have picked up fifty millions from the wreckage made by this conspiracy to confiscate the property of a business rival.

But the episode of 1907, although more definitely segregated, more clearly marked, as an example of the abuse of credit power and its consequences to the whole people, is only one of a series of very similar episodes in our financial history, 1857, 1873, 1883, 1894, 1907 and 1920-21, every black year *a natural consequence of the control of the public function of credit by private agencies.* The cost of these experiences to our industry and civilization is beyond computation. In money values alone it exceeds more than five times the national debt. It would rebuild every railroad in the United States more than six times over, more than a billion dollars for every year since Washington became our first President.

This is the price we pay, and must continue to pay for our system of public finance; for *permitting public finance to become private property.*

To abolish private exploitation it is only necessary that the general government resume its delegated authority to issue the money of the people.

A nation that, as to its political form and organization, is a democracy, but which as to its substance and function is an economic autocracy, is a kingdom divided against itself. It cannot endure permanently with form and function in opposition. It will become avowedly a political autocracy, in form as well as substance, or it will become, in substance as well as form, the economic democracy designed by the fathers.

So long as this state of affairs continues, so long as individuals in place of government retain control of the monetary measure, there can be no real religion, there can be no real liberty, there can be no real national life. The bases of religion are love and fraternity. There can be no fraternity while an unjust measure is permitted to introduce discontent and strife into all the relations of social life. The basis of liberty is justice. There can be no real justice while an unjust measure continues to nullify the lessons of wisdom and experience. The basis of national life is equality. There can be no equality so long as an unjust measure continues to rob the many for the benefit of the few. The control of weights and measures, including money, and the materials of which its symbols are made, is a prerogative, and a necessary prerogative of national life. It has been held so by all the courts of judicature, by all the exponents of law from Plato . . . . to the decisions of the Supreme Court of the United States.

The gold question remains; and in our strenuous life the gold question involves considerations which not only affect the future of this nation, but of mankind at large.

Under these circumstances the time seems to be approaching when the money question will have to be debated upon much higher grounds than any which have hitherto been advanced in the contention. It will have to be argued not by appeals to ignorance and passion, but by appeals to religion and patriotism, to fraternity and to equity.

Where Dixie Sleeps Farthest North

Confederate Prisoners Who Never Went Back to Their Homes Rest in Peace in Wisconsin Plot

By HAZEL HANKINSON

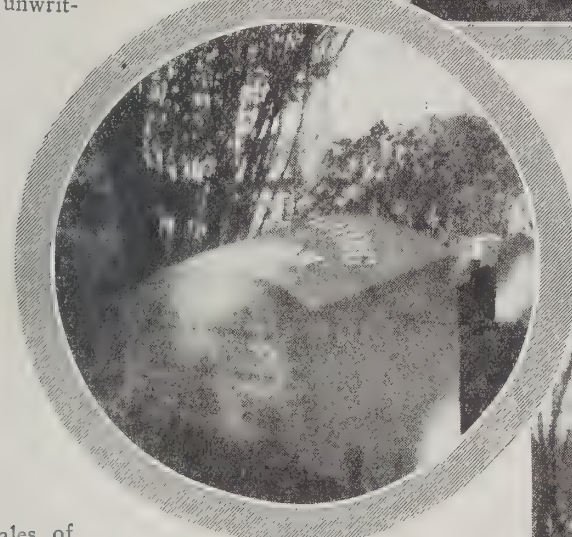
"At her request, she is buried beside 'her boys,' not one of whom she ever knew personally."

VISITORS to Madison, Wisconsin, are surprised to find in a quiet corner of the city's beautiful cemetery rows and rows of little stone slabs marking the graves of one hundred and thirty-six Confederate soldiers who were laid there to rest during the days of the Civil War. That there should be a Southern cemetery in a state which lies so far to the north of the war's battlefields seems a curious fact. But the really puzzling part of it is that there is included within the plot a one-hundred-and-thirty-seventh grave—the grave of a woman.

How these soldier boys came to be buried here, how a woman's grave came to be among them, is one of the stories from among many unwritten tales of loyalty, of love, and of allegiance, which the Southern people felt for the cause they were sure was a worthy one in the days from '61 to '65.

Present entrance to Camp Randall where hundreds of Southern soldiers were kept prisoners in the days from '61 to '65.

Row on row of little stone slabs mark the graves of Civil War soldiers of the South at Madison, Wisconsin. It is the nation's most northern Dixie cemetery.



Circle—Mrs. Alice Whiting Waterman's grave among those of "her boys" in Confederate Rest.

Right—The last remnant of Civil War days at Camp Randall, Madison, Wisconsin. This old guardhouse remains as it was when Northern and Southern "boys" served time in camp for misdemeanors.

"It happened in '62," relates one of the old Wisconsin guard, "that a goodly number of the 'Boys in Gray' were stationed on Island No. 10, a point in the Mississippi near the corner of Tennessee, Missouri and Kentucky. Early that spring a troop of them were surprised and taken captive by a regiment of Federals, and thence they were sent to Northern camps to be retained for a time as prisoners of war. Some of the 'rebels' were kept at Springfield, Illinois; a few remained at Camp Douglas; while a large number were dispatched in boats up the Mississippi to be cared for at Madison.

"And they needed to be cared for," continues this veteran of the Nineteenth Wisconsin, the regiment selected to guard the prisoners at Camp Randall, the site of which now borders the campus of the Badger State's great university. "In the defense of Island No. 10, the Southern boys had been exposed to the cold rains of early spring. Often they had stood up to their waists in water in resisting our attacks, and they were not physically fit to endure the cold, raw winds of Wisconsin's April weather. Neither did they have clothing warm enough to come into such a climate."

That they received the best treatment possible, the Southerners themselves who survived admit. They were given the same rations as the "Boys in Blue." They were given as comfortable quarters as could be arranged for them. But just as the dread influenza took away so many of our soldiers of the World War, so pneumonia seized these boys from the South, and they died by the tens and the twenties. In less than two months from the time they arrived, the little plot of ground set aside by the people of Madison for receiving their bodies was filled. And the greater number of those who died were members of the First Alabama Regiment.

How some of the citizens of Madison, loyal supporters of the North, carried food and medicine and comfort to the suffering young fellows in the hospital; how one family, some of whom still reside in the city, took one of the boys to their own home and cared for him until he finally succumbed; these are touches of tenderness which show that at heart North and South were never far separated. But the chief concern of this narrative is the woman who "is buried beside 'her boys,' as she loved to call them, not one of whom she ever knew personally."

For several years after the war was over, "Confederate Rest," as the little Southern graveyard came to be called by the people of the Northern city, was almost forgotten. And it was not strange, for Wisconsin, like every other state, had her own soldier-dead to mourn over and to tend. While the resting places of the strangers were not allowed to be molested, they were neither marked nor given special attention.

One day there came to live at Madison from Baton Rouge, Louisiana, a Southern woman, Mrs. Alice Whiting Waterman. A widow she was, without very much of this world's goods. But when she discovered the little cemetery, "Confederate Rest," where lay the "Boys in Gray," she gave all of her spare time to the tending of their graves. With her own hands she heaped the earth into mounds above each of the one hundred and thirty-six. From her own meager funds she paid for wooden slabs which were marked with the names of the boys, and with the dates of their deaths. She became as devoted to "her boys" as though they had still been alive, and by her beautiful character and personality she won the aid of others in her noble work. Three of her most loyal helpers, it is said, were Union men, each of whom had lost an arm in Dixie. Around the little plot of ground Mrs. Waterman planted hedges, "to keep the cold wind off my boys," she said. White flowering bushes are still to be seen there after fifty years or more. She had planted them amid the graves because they would blossom even though she were "not there to watch them." Two butternut trees were set out through her efforts so that "the children will go there to gather nuts, and thus make the place more pleasant by their presence."

And so, when Mrs. Alice Whiting Waterman died in 1897, having cared for "her boys" for twenty-five years, she, too, was laid down for her last sleep in "Confederate Rest." During all those years she had longed for the establishing of a monument of granite on which should be carved the names of these dead soldiers of the South. But not until after her death was the place marked through the efforts of the Daughters of the Confederacy, and then no greater consideration was given to the soldiers themselves than was bestowed upon the little lady of the South who had mothered them after they were dead.

Today at "Confederate Rest," the northernmost cemetery of the "Boys in Gray," stands the longed-for monument of substantial proportions containing all the names of the soldiers and that of Mrs. Waterman in bold relief. Each grave is marked with a slab, and that of Mrs. Waterman is distinguished by one larger than the rest.

The graves of the Southern "mother" and "her boys" are as tenderly cared for as are the graves of the Wisconsin soldiers in their plot only a few rods away. Each year on Memorial Day, every grave of the Confederates, as well as every grave of the Union soldiers, receives the Stars and Stripes and an offering of flowers. Each year, midway between the resting places of the "Boys in Gray" and the "Boys in Blue," the salute is fired by silver-haired men in blue and young men in khaki.

And a little woman who loved "her boys" whom she had never seen did much to find and to foster that spirit of tenderness.

On One Point They Are Mute

WATCHERS on the partisan towers are not so sure as they were a few months ago that they have squelched the Money Question by throwing the spotlight on Prohibition. The amount of so-called "sound money" propaganda in the country is amazing, and it is being printed in the best dailies as well as the smallest weeklies of the land. There can, of course, be no objection to this: the more propaganda the sooner will the people realize that there actually is a Money Question and that it is not academic nor of interest only to financiers. And the greater the halloo for "sound money" the better the chances that the thinking classes of the people will inquire as to the cause of the hue and cry and investigate for themselves whether our present system is "sound."

The Dearborn Independent has contended all along that this question is not for amateurs but for men with the financial mind. It is perhaps the measure of our emergency that men with the financial mind have been more captivated by the profits of the present system than with the principles by which money becomes necessarily the servant of all. Not that the high priests of the present system are unaware that danger threatens—they are very well aware of it, but there are no prophets to lead the financial world to confession and reformation. If this state of mind continues, then, as always has been the case, the awakening will come only through disaster, and it is disaster which the warnings uttered here would prevent.

In all the propaganda sent forth by the various financial groups there has been no straightforward discussion of Interest. Yet it is on the rock of Interest that the present system is to be wrecked unless its course is changed. There have been, it is true, a few elementary appeals to the common sense of the people showing that some hire or reward is due for money lent. But as to Interest in the commercial sense, as to Interest with bonuses and commissions and usury as the Banks have notoriously practiced it during the past ten years, no word. As to Interest itself, what it is, why it is, how arrived at, the extent and character of its effect on society, no word. Yet the propagandists must know, if they are admitted to the confidence of the financial high priests for whom they work, that it is precisely this matter of Interest which is causing restless nights among the hierarchy of gold.

The problem is simple. There are about five billions of dollars among the people.

The people are paying interest on forty billions of dollars.

How long can a people pay interest on eight times the amount of money in existence or at their disposal?

This question is more alarming than it would have been ten or twenty years ago, for we are mounting toward the cracking point at a pace which amazes even the financial rulers. Because we have paid for fifty years is not the slightest indication that we shall be able to pay another fifty years, the reason being that the peak is reached, the crisis has been sighted even by financiers who would like to deny the possibility of a crisis.

Now that there are so many "experts" writing on these subjects, will not one of the bankers' groups or one of the political parties commission someone to take up the matter of Interest? Tell how much of the charge made for money today is really "interest" and how much is something else. State the scientific basis of interest. State the facts regarding the interest charges borne by the United States today (the rest of the world is simply crushed under Interest). Tell us, if possible, how the annual interest charges can be borne, unless the increase of national wealth will mean a great increase in money—and if money should be based on wealth what would then become of that other fetish of the system, the Gold Standard?

There is no objection whatever to all the propaganda the aroused financial interests desire to broadcast. But why not discuss those parts of the question which touch the people's daily experience? In fact, we challenge a discussion of Interest.

Give the President a Chance

IT IS regrettable that the political note has been sounded so early in Mr. Coolidge's administration. The fact is part of the essential indecency of politics, and although Mr. Coolidge's friends have been among the offenders it must be remembered that the President himself has given every evidence of being more interested in the task that confronts him than in his own political fortunes.

The result of unwise and premature electioneering, however, has been to subject the President's actions to political interpretation, especially among those in office and in journalism whose meat and drink is political speculation and mystery. It is earnestly to be hoped that the habit will not spread among the people. For if there is any duty which citizenship lays upon a people who have endured the death of one President and the installation of his successor, it is the duty of giving the new incumbent the fairest of all fair chances. The success of Calvin Coolidge in the discharge of his responsibilities is the success of the United States, and that is the only light in which Americans can view the matter.

Mr. Coolidge doubtless can take ample care of himself, but it is submitted that judgment should not be passed upon him until his motives and methods are fairly well known. To illustrate how easy it is to misjudge a President and dishearten a people, take the handling of the coal strike. One view is that Mr. Coolidge flinched in the face of his first serious problem by handing it over to Governor Pinchot. Pinchot partisans, anxious to manufacture political thunder out of the situation, have even said that Pinchot forced the President of the United States to hand over the anthracite strike for settlement at Harrisburg instead of at Washington.

That these interpretations can command credence simply shows how necessary it is that Calvin Coolidge should be better known.

Heretofore we have demanded that our Presidents do everything and delegate nothing, a habit which has arisen through the methods of certain Presidents who unduly loved the limelight. But suppose President Coolidge has other ideas about that? Suppose that he has resolved to be a Constitutional President with a constitutional regard for the constitutional right of other officers of the Government? As Governor of Massachusetts Mr. Coolidge learned what pertains to the office of governor. It is related that as Vice-President of the United States *en tour,* a certain program required the governor of a state to pay his respects to Vice-President Coolidge. Mr. Coolidge immediately canceled the arrangement and revised it to require the Vice-President to pay his respects to the governor, because in the limits of his own state a governor is superior in station to all save the President of the United States. If, then, the anthracite strike centering in Governor Pinchot's jurisdiction, President Coolidge should regard the governor as the first authority properly to undertake the work of settlement, is he to be judged as sidestepping a duty or as proceeding with entire propriety? Clearly the latter. Mr. Coolidge took proper action and the result though temporary is appreciated. The next step, the reduction of railway rates on coal, comes more directly within the President's official jurisdiction. So that the Coal Question is still within the President's sphere of influence and responsibility.

What this country desires is not a President of this or that party, nor a President of this or that temperament or method; we all desire a President who will serve the people in their numerous difficulties, and to the end that Calvin Coolidge may do that to the utmost of his powers it is only good citizenship to give the President every chance and the benefit of every doubt.

Will the Wizard Whiz?

IF MR. LLOYD GEORGE comes to the United States it will be interesting to observe with what success his prestige survives the experience. America is the rock on which all their Foreign Mightinesses have broken. From the visit of Prince Henry of Prussia to the front of Clemenceau, reputations are few that have survived the calmer atmosphere of American judgment. M. Coue proved a better ambassador than them all, and even he departed just as the inquisitive were finding that the god was stuffed with sawdust.

It must be said, however, that Mr. Lloyd George has had expert counsel in preparing for his visit. He has made it almost imperative for the Jews to accord him a great reception. He has made it absolutely imperative for Mr. Hearst to tie down all the sirens of publicity. Mr. Brisbane has already started the ballyhoo work. It will probably be a personally conducted tour such as defaced the first of the recent visits of Dr. Lorenz who came on as a press attraction and was so surrounded by Jews that the general public dropped the matter in disgust. Dr. Lorenz is now an almost unmentioned resident in the United States.

Mr. Lloyd George has been first the creature and later the companion of the Jews to such an extent that he has been totally discredited in his own country. The election that turned Lloyd George out of office also cleaned out his Oriental friends. Lately he has written a very ignorantly composed article on "Anti-Semitism and Zionism," which, aside from his own too evident desire to secure Jewish favor, contains nothing but what has been printed endlessly in Jewish propaganda. To make a critical analysis of his article would be a waste of space. Never a thinker, much would still be forgiven him for being only a truth-teller.

Mr. Lloyd George says he comes to bring Canada his "thanks," which indicates an unconscious pose of royalty *en tour.* Canada will smile at this. His thanks, forsooth! Is it part of his mission to induce Canada to let down the bars which that Dominion has put up against the Jews? Quite likely.

The preceding visitor from England, Lord Robert Cecil, coolly informed us that the Great War was fought to attain two objects: one was the League of Nations and the other was Palestine for the Jews. After that Lord Robert Cecil was hearkened to no more. Lloyd George stands for the Palestine end of it, but is likely to say so only in exclusively Semitic circles.

Nine Generals Govern Spain

THE disgust with which portions of Europe have regarded inefficient government has manifested itself in Italy by the Fascisti movement and in Spain by the protest of high military authorities. Both movements are notably the same in character—they are revolts not against constituted authority but against dishonesty and inefficiency in high places. The Italian king and the Spanish king both accepted the objectives of the revolts. The news from Spain was, naturally, given a bad color at first, and in American ears the announcement of military rule has a prejudiced sound. But, quite regardless of the question of militarism, it is generally true that a nation's army is more jealous for the nation's traditions than are its politicians, and in a crisis honest army officers are more to be depended on than are self-seeking statesmen. This is true of the British army, the United States Army and the Italian army. It is probably not too much to say that Americanism is better understood by the officers of the United States Army than by any other class of citizens, and it is a refreshing experience to get the army point of view in evaluating certain movements going on in this country.

The Italian army saved Italy from a government that was rapidly ruining it. The Generals of Spain seem to have the same service in view for their own country, though it is rather early to know how they will succeed.

These invasions of the civil field by the trained military citizen may indicate that the suggestion to use the American Army for law enforcement in the prohibition crisis is not so impossible as it may seem. The army has been used for less important purposes than that, and the upholding of the Constitution of the United States is a sufficiently dignified work for any body of men in the public service. But what is most important of all—

The Army could do it!

Mr. Ford's Page

WHATEVER is not related to some necessary, urgent and practical end soon tends to faddism. In whatever direction the observer may look it may be taken as almost an infallible rule that where the most fads are seen there is the least certainty of knowledge or usefulness of method. Education, for example. Here the fads change like the styles, indicating a fertility of invention as well as a lack of guiding principle, and perhaps also a shrewd conviction on the part of the suppliers of educational utensils that the more ephemeral the fads the brisker the trade. The constant tinkering of our money system, the endless revision of our political methods, the restless searching of the people for foundations which they took on hearsay and which do not exist, all these show that a day of judgment has arrived in which all that is base and false is to be tried by that fire which tests every fiber.

IT IS time to protest against the fad of denouncing industry as "materialistic" and this age as an "age of materialism" because it is industrial. If lily-fingered inefficiency is "spiritual," the sooner the calloused hand becomes general the better for the world. To manipulate materials that they may serve the personal and family and community life of the world is very far from "materialism." Industry is not materials alone, and even if it were, materials are among the most wonderful creations. Industry is Science, Faith, Vision, Destiny, Discipline, Growth—all the spiritual qualities of common life. Industry is Idealism crystallized and made real to all the elements. The "age of materialism" was when men had no materials; their mastery of materials is emancipating them from the sordidly materialistic.

The most persistent fad of all was slightly indicated on this page last week and may now be described as the Fad For Denouncing The Material World. This fad in its superficial aspect is fostered in the name of art and in its deeper form is held in the name of religion and philosophy. There is a fad for the use of the term "spiritual," which may mean anything or nothing depending on the novelist or politician who uses it. In every case it is used as the opposite of "material."

The "spiritual" is supposed to be the lofty invisible essence of perfection, and the "material" the crass and sordid sign of degeneration. Because the period in which we live is busy stocking the world with the utilities of community life it is denounced as a "materialistic" generation, and because this work is gratefully absorbing to the mind and energies of men we are condemned as being the prey of "materialism."

And these judgments are usually passed by people who, through material means, are able to load on others the work of gratifying their material needs. Has an engineer ever been heard to use "materialism" in this sense, except when speaking of those whose greed for gain hinders the work of building and service? Hardly. This is left for the faddists.

The trouble is that we are wrong on our opposites. In the old religious phraseology it used to be assumed that Justice and Mercy were opposites; the Deity was not assumed to be Just because that was assumed to prevent his being Merciful. But the opposite of Justice is not Mercy, the opposite of Justice is Injustice. And so with "material" and "spiritual," they are held to be utterly antagonistic one to another.

Modern industry is held to be "materialistic" and hence "unspiritual." To "spiritualize" industry apparently a lot of talk must be injected, a lot of meetings held, a lot of artificial rosy atmosphere created, and the practical purpose of industry impeded. Speechmakers and advance agents of impossible millenniums, who are themselves supported by the "material" labors of farmers and bakers and clothing makers, and sheltered by the "material" labors of builders, and warmed by the "materialism" of the mining industry, and transported hither and thither by the "materialistic" transportation system, constantly berate the system on which they subsist, although every opportunity that has been given them to produce a better system has resulted in hunger and suffering. Now, hunger and suffering are truly a spiritual tragedy which our so-called "material" civilization constantly averts.

It is a fact that men never so really merit the term "materialist" as when the material things of life are scarce. Who is more a "materialist" and yet who more lacks materials than the savage? One fact is absolutely determined, that the lack of the material means of living leads more surely to "materialism" than does their possession. The lack focuses the mind constantly on the material thing; the possession of the material thing releases the mind to other considerations.

One of the great spiritual minds of the race, a mind whose thoughts have been received as Sacred Scripture, said: "That was not first which is spiritual, but that which is natural; and afterward that which is spiritual." There are degrees apparently but no primal antagonism. There is order but no necessary enmity. The way to the one is through the other. In practical life the way to creative living is through emancipation from the hourly uncertainty of supply. Too much of the material may become a burden—and it is a burden when it is a mere accumulation—but too little of the material is a ceaseless anxiety which soon becomes a drain on all the energies of life. "That is not first which is spiritual, but that which is natural." The ages of spiritual renewal were ages of a degree of material security.

If it cannot be claimed that modern industry is spiritual, may it not be said that it has all the elements of spirituality within it? Does the millennium require our getting rid of it? In the Golden Age will people not eat bread?—and if so who will raise the grain and grind the wheat and bake the flour? Shall there not be modes of transportation?—and if so who will man the shops in which the vehicles of sky and earth and water are manufactured? Shall there not be a money system also?—and who will administer it in justice? Are not all these things implicit in the marvelous system which we have seen grow up around us this last half-century?

True enough, too many hindrances prevent this view of industry being taken today. No one would claim that the average workingman thinks of himself as a public servant. But are not the elements for that thought present? Look over the spiritual elements of industry, which strangely enough are its strongest material elements, too. There is, first, Science. Though it deal with matter, Science is not materialistic; it discovers truth, principle, the invisible and spiritual laws by which all things exist and consist. The more Science involved in an industry, the stronger that industry's foundation, the sounder its service. The less Science, the more fraud and waste and evil effect upon the community. Businesses that have gone under the ban are those that have been false to Science for the sake of gain. Knowledge, Science, is third in the list of spiritual qualities—faith and virtue being the first two: "add to your faith . . . . knowledge."

Then there is the quality of Service—not only the "service" which is urged for the sake of getting trade, but that which runs from the individual to the universal purpose. All who are engaged in legitimate industry are serving the world whether they give themselves the credit for it or not. But beyond that daily service of individuals to the community there is the service of industry itself to the furtherance of the purpose of human society. No one now doubts that modern industry is a stage in development which had to be passed through, and is an essential layer in the foundation of a greater future. We say of prophets and statesmen that they came in their time to do their work, we may say the same of industry and its universal products. Can anyone doubt that the wireless and the motor car and the airplane have come in their time?

One other spiritual quality in industry—Discipline. The control of matter and mind, the bending of energy to a given purpose, and not for the moment only but for programs of progress and production extending over years and in some cases over lifetimes, this surely is not "materialism," it is rather the descent of the higher elements into the lower for the sake of refining and elevating the significance of the lower.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Dictatorship May Mark the End of Mussolini

Italians Find Repression Irksome and Usually End It, History Reveals

By WILLIAM KNIGHT

ONE of the most difficult tasks for a nation, as for an individual, is the living down of a past. Since 1870, when the unification of Italy was completed with the annexation of Rome, the new Italy which resulted has been under the tremendous burden of a glorious past. To the rest of the world, Italy has been, during the last fifty years or so, "the petted godchild of Europe" and "the great-grandmother of civilization." Ruskin and Browning, Howells, Byron and Goethe, and, in fact, the great poets of all nations have made of Italy a fairyland populated by the shadows of a past, a past so glorious and so romantic that it is almost impossible for a foreigner visiting Italy for the first time to see anything other than shadows, ghosts and the ruins of a mighty empire.

It is all very well for a nation to have a past, and it is very gratifying to hear people of other countries extolling the past of your native land, the beauty of her skies and the art treasures of her museums, but when you have heard this sort of music all your life and you have never heard a word of praise and appreciation for what the present generation has accomplished, as Italy has, you cannot reproach the Italians for feeling sick and tired of hearing Rome mentioned as the "Eternal City" and beginning to resent the admiration of the world for the "petted godchild of Europe."

Italy Before the War

THE Italians, these highly gifted and temperamental Latins, successors of a world-conquering race, are not so universally understood. The fact that Italy has today a merchant marine comprising upward of three million dead-weight tons, twenty thousand kilometers of railways, a number of most important national industries and enormous possibilities for hydroelectric applications, has not been generally known to the world at large until recently.

Politically as a European power, up to 1914, Italy was never taken seriously by any important nation. Its rôle was always to agree to the policies of one of the dominating European powers. In every cartoon illustrating the part played by Italy in the so-called Concert of Nations, Italy has always been represented as the dancing partner of either England, France or Germany. In every colonial adventure or annexation expedition organized by a European power for its own benefit, while it took the meat, Italy was sometimes allowed to have the bones and, more often, not even that much.

While in the eyes of tourists, Italy was only a "has been," in the eyes of the governments of the great nations of Europe, Italy was little more than a geographical expression and a negligible factor in international politics, although in a commercial sense she was an important factor as an importer of raw materials, foodstuffs, and manufactured products, and as an exporter of wine, fruits, marble, alabaster, sulphur, cotton and silk products.

Italy could do no more in fifty years than she has done. Moreover, the governments that Italy has had during this period of national growth could not have done any better; yet, in the eyes of the younger generation of modern Italians, the policies of Zanardelli, Sonnino and Giolitti have appeared weak and vacillating when compared to the policies of the earlier governments of Cavour and Crispi, and to the legendary exploits of Mazzini, Garibaldi, and Victor Emmanuel II, the fathers of the Italian nation. The trouble with the Italian Government was that common to all democracies which are not created by the self-conscious will of a united people. Politically, the unity of Italy had been obtained in 1870; actually, the North, the Center, and the South of Italy were separated by centuries of independent history, each having different interests, each having a different conception of the state, which was the melting pot of a race divided into small historical groups having nothing in common but their origin. Such being the case, how escape from that political quagmire, of which Giolittianism has been only one type, government by the distribution of patronage the smothering of opposition by bribery?

Italy's Aims of Empire

SUCH a state of affairs was bound to create a strong feeling of dissatisfaction among the younger Italian generation which knew not the Italy of pre-revolutionary days. The present generation was born in a united Italy. It does not know what a hard task it has been to form such a political union and what an even harder task it has been to form the Italian consciousness. Consequently, for years, even while Italian industry was growing and while Italy was becoming every year more and more a strong power, the youth of the nation was clamoring for the "new man" who would guide Italy to the goal of high destinies.

Strange people the Italians. While on the one hand they resented the grandeur of Rome and the natural beauties of their country being mentioned abroad as the outstanding features of Italy, they themselves were always clamoring for the "new man" and the "higher Italian destinies," meaning by that, the MAN who would lay hold of the Italian government and secure for Italy the respect of all other nations, restore the prestige of Rome and the power of Venice, re-establish the Italian supremacy in the Mediterranean and extend the Italian borders over the Alps.

This strange sentimental mixture of aspirations for the future, pride in a glorious past, and restlessness of a naturally emotional race was not, however, the only cause of dissatisfaction in Italy. Economic causes have been more important than purely sentimental causes in the Italian history of the last forty years. In 1892, Bissolati and a small group of earnest men organized the first real political party in modern Italy, the "Socialist Party of Italian Workers, and founded the newspaper, *Avanti*, which has since been the organ of Italian socialism. The Italian Socialist party preached the redemption of the workingman, and the Socialist movement has greatly contributed during the last forty years to the awakening of a political consciousness of the industrial and rural masses.

Alongside the Socialist party, another political party, the Catholic party, has also done much for creating a sense of political responsibility and for amalgamating into a political union Italians of the North, the Center and the South, who previous to that time had nothing in common but a flag. The Catholic party has been the great support of Clericalism and its chief issues have been the school and the "Roman question." This party has been particularly strong in the agrarian sections of Italy, which include one-third of the total population.

A third political party must be considered before we can obtain a fairly complete picture of the Italian political complex. This is the Nationalist party. There are manufacturers and employers of labor in Italy who have created Italian industry and commerce and who take pride in their patriotic creative effort. But there is also a "political industry" in Italy which is not grounded on natural conditions and which survives only through governmental protection and manipulation of the machinery of the state. The National party is a recent creation of this latter type of industry, the sole function of which is the maintenance of a favorable atmosphere of political intrigue. Imperialistic in foreign policy, this party favors the capture by force of foreign territories to supply resources that Italy lacks, and in domestic policy follows the Bolshevistic idea of the dictatorship of the *millionariat*.

To this nationalistic idea of an "Imperial Italy" were naturally attracted the enthusiastic young men of modern Italy in quest of the "new man" who would guide Italy to her "higher destinies." Their motives, however, were purely emotional, while the motives of the particular class of industrial and commercial interests that gave rise to the National party were selfish and partisan. The Libyan war of 1911 was the first practical materialization of modern Italian Imperialism. While the Socialist and the Catholic parties are purely popular parties, the National party is the exponent of a class of intellectuals possessing a nostalgic desire to revive the grandeur of Rome, backed up by a small but powerful clique of financial interests. It is the party of patriotic demagogues which makes no great campaign for votes but contents itself with the appliance of direct pressure upon successive governments for the furtherance of its interests. This party is particularly strong in Northern and in Central Italy but is strongly opposed in the South where Socialists and Catholics have always been decidedly against any sort of external war, being concerned only with internal class struggles.

A National Spirit Created

THE most important social function of all political parties in Italy has been to create during the last fifty years a national spirit which did not exist before. To this end the national public school system has also greatly contributed, and, more than anything else, the compulsory military service, which brought together Italians of the North, the Center, and the South. The army and the navy have really been the true melting pot of modern Italy, and the World War has been the great test of fifty years of earnest efforts on the part of both the government and political parties for creating the Italian consciousness.

In spite of the fact that in 1914 many persons opposed Italy entering the World War, the great majority of Italians from all sections of the country forgot all differences of political opinions and proved to be Italians first. This is particularly true of the large majority of the Socialist party which, when Italy joined the Allies in the war, flocked to its banners and accepted the World War as a struggle for international justice and international solidarity, even if this was in opposition to the rigid tenets of Marxism and the dogmas of the doctrinaire majority then in control of Italian socialism.

The part played by D'Annunzio in bringing about the entrance of Italy into the war is probably the best illustration of what can be done by appealing to the emotions of a highly temperamental nation, which is "a strange mixture of explosive youthfulness and of encumbering decrepitude."

At the end of the war Italy emerged from those momentous and tragic years of struggle possessed of her redeemed provinces and with victory over her inveterate Austrian foe. She also inherited from the war acute labor disturbances and financial chaos, attendants of post-war conditions in all other combatant countries.

Shattered ideals of peace based upon a chimerical international justice, broken promises, death and misery, were the rude awakening from the ghastly nightmare of four years of war. Revolution and violence were the reaction. There was, however, a new element which had germinated out of the war—the returned soldier, who had fought and suffered, who had saved Italy on the Piave and had settled the old Irredentist problem at Vittorio Veneto. The returned soldier was not disposed to let Italy be torn to pieces by Italians after he had saved her from the enemy. To those who pointed to Russia as the mother of a new civilization, they answered that if the world needs a new civilization, this will be dictated by Rome. A leader was needed, a "new man" who would guide Italy to her "higher destinies." That leader was found—Benito Mussolini. A name was needed for the movement—"Fascismo" was the name adopted. A formula was demanded of this new movement and the answer was—"Italy above all else; but through the agency and under the direction of those who by their blood saved her."

This is the fundamental formula of Fascismo, its immediate purpose being to destroy each of the antagonists of the national idea, socialism, clerical agrarianism and the bureaucratic, paternalistic state. The means used for this purpose—any means. Its final program was enunciated by Mussolini at the conclusion of his speech on the Capitoline during the celebration of the birthday of Rome: "We shall ever march onward, toward that Imperial Italy which is our dream and our faith."

Fascism a Strange Mixture

OF ALL the revolutionary movements which have taken place in Europe, during and since the war, Fascismo is one of the most interesting and represents a strange mixture of revival of long-forgotten imperialistic dreams of world domination, of Bolshevistic methods of government accepted by a nation which is fundamentally anti-Bolshevist, of capitalistic interests saved from Communism by a man who in June, 1914, was on the brink of conquering Italy as the leader of a turbulent revolutionary Socialism, and of justice, injustice; dreams and realities.

Under the sway of Fascism, "Italy today," writes George D. Herron, "teems with the voices, with the clamors and vital forces, with the turbulent overlife of a new national springtime."

Fascismo is the resultant of social and psychological forces integrated by a born leader of men, a modern "signorotto" of the Italian rural districts who, as Doctor A. Livingston, head of the Italian and Spanish Bureau of the Foreign Press Service, defines him, "rode the black horse of political revolution for the first half of his life and who now chooses the white horse of patriotism for the rest of his ride to domination and immortality."

A native of the province of Romagna which has always been a boiling pot of political agitation, Benito Mussolini has the greatest contempt for the mob, for the politician, for anything which is not *will* and which is not *action*. The soldier does not mean anything to him except as a means of action. Mobs, politicians, soldiers, financial interests and political programs—he has used them all and has allowed himself to be used by them, swallowing them all in the end, till it is a question whether he will be able finally to digest them. His conception of politics and history has led him, since the beginnings of Fascismo, to the organization of returned soldiers into a military oligarchy to restore order at home and to create at the same time a strong Italy worthy of the traditions of an Imperial Rome and the Venetian Republic. The whole Fascisti organization is modeled and disciplined as were Caesar's legions.

Fascismo is a word derived from *Fascio* which was the insignia of the Roman Empire—a bundle of rods tied around an ax symbolizing the colonies of the Roman Empire all tied together with Rome as the center. The Fascisti helmet was patterned after the Roman helmet, while the black shirt and the fez are strongly reminiscent of the Venetians of the bravest days of old. The Fascisti army is composed of army corps which are called "Legions." The Legions are divided into "Cohorts" and Cohorts are divided into "Centuries," commanded by a "Centurion." These are again divided into "Squads." The names are those used by Imperial Rome. The fighting Fascisti are called "Principis" and the reserves, "Triarii," or men of the third line. Again we find the Roman names. The Roman army salute is used by all Fascisti, by all schoolboys and is gradually becoming the generally accepted form of salute among all Italians, and the rallying cry, "Eia! Eia! Alala!" is a combination of Venetian and Roman war crys.

What Mussolini Faces

FROM top to bottom, Fascism is the rebellion of an old race of conquerors, of artists, of sailors, merchants, artisans and poets that for centuries has been kept separated into small groups and that after fifty years of national life has found once more, at the end of a bloody war, that spirit of nationality that centuries of foreign domination could not destroy. It is not surprising that Fascismo revives in Italy the memories of Rome, if we consider that the Roman Empire remains the only *national* government that Italy has had in two thousand years. The Roman army salute revived by Mussolini—a swift, graceful, upward sweep of the right arm, hand extended, palm down, stopping at the level of the forehead, a salute which has been adopted by almost the entire nation, has destroyed within a few months the barriers erected by centuries of different culture and different history between Italians of the North, the Center, and the South.

If Fascismo lasts long enough, Italy will be once more the most imperialistic nation in the world. External problems are only beginning to be faced by Mussolini, who has always wanted one thing at a time. After getting it, however, he has always wanted something else and something bigger. But we must keep in mind the fact that for Mussolini, modern Italian history begins with and has its sources in the war. The question of the emigration of the surplus Italian population is bound to be the keynote of the foreign policy of the Italian Government,

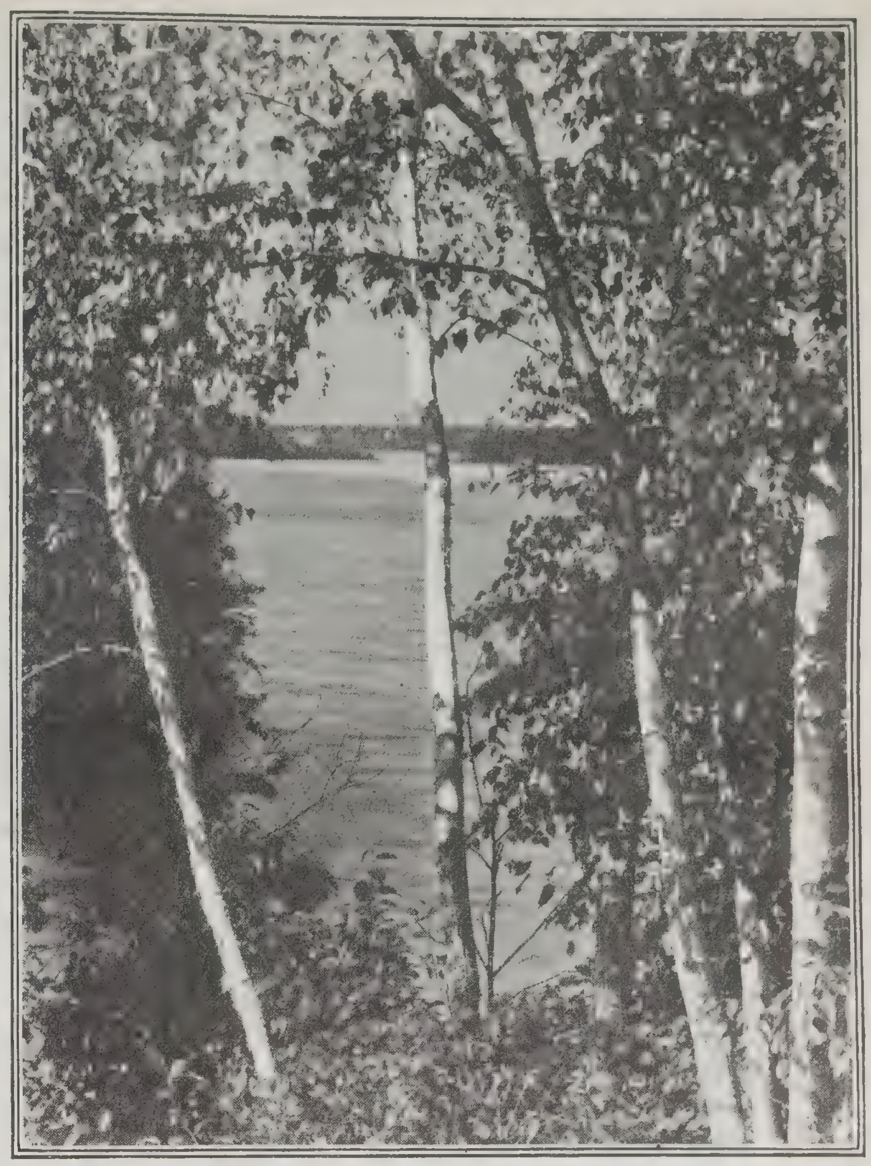
Balancing Beauty and Usefulness

Individuals and Communities Profit and Further Plans for Out-of-doors

By FRANZ A. AUST

Associate Professor of Landscape Design, University of Wisconsin.



Preserving beautiful views for folks to enjoy is part of Wisconsin's plan.

SAID a business men: "When I go out into the country to make a deal with a farmer, as I often have to do, I know by the looks of the dooryard the kind of man I'm going to meet. Pig pens near the front door, calves bawling around the front yard, no grass, not a tree—I know before I see the man there's neither plan nor system on that farm. A few miles farther on, maybe, I come to a place that's different—quiet stretch of green, grassy lawn, shrubs planted around the house, trees, restfulness, beauty. 'Here's a good business man,' I say to myself, and I haven't yet been mistaken."

Good advertising? Both the man and his farm have gone up several notches in value in the stranger's mind just because the dooryard was neat, and that old elm at the corner softened the angles of the house, and the redness of that sumach along the driveway was so cheery, and the Virginia creeper over that kitchen door spoke of a contented wife and children somewhere around. It's a common trait of a city man to appreciate beautiful surroundings when he sees them on a farm.

And speaking of traits. There is, among neighbors, one much used and abused. Sometimes it affects us in the form of a more expensive car when Mr. Next Door buys that "something-better-than-a-flivver." Sometimes it's the wife wanting new curtains like Mrs. Brown's. There are some objections to this trait which probably was a gift to us from Solomon or his neighbor, the Queen of Sheba—whoever envied which. But it works wonders with dooryards, especially in newly settled communities. One family desires beauty and color in the dooryard. Soon a whole neighborhood is adding a flower bed here and a lilac bush there, and everyone finds himself growing a greater respect for himself and for everybody else whose surroundings are becoming more attractive. Then follow more and better books, and good music, and young people going to college.

Said one of these young agricultural students recently: "I never knew hawthorn bushes were worth anything until I saw one being set out on the university campus the other day. Why, we have skads of 'em at home on the farm; might have one or two in the yard as well as not, and they wouldn't cost a cent. Never seemed very pretty all bunched in, the way you find 'em wild. Have to tell Dad about it."

Little things, these seem, all of them, sort of exalted boomerangs. But the good opinion of the city business man, and the standard-raising envy of the neighbors, and the added respect of the farmer boy student for the growing things of the countryside, are all playing a part in the big program. It's a program of profit for farm and family and community in the country. It's a program to bring about a better countryside which many a state is trying to see fulfilled.

Some states have a definite organized service for beautifying the landscape. This service is either furnished by the state college of agriculture, or by the United States Government working through its Department of Agriculture, or by a special bureau of the state government.

Massachusetts furnishes plans and surveys and tries to get in touch with every community through her college of agriculture together with funds from Uncle Sam. There is a service for the designing and beautifying of school grounds and parks and playgrounds and cemeteries. Exhibits showing what is being done in other communities are placed in libraries and town halls. Lectures which specially emphasize the community's own problem are delivered. While rural communities are given the preference, no town or city in the state is barred from receiving assistance.

Iowa through her college of agriculture gives advice to individuals and communities, but no plans. She keeps what she calls a "Demonstration Farm" or two in each county, however, and the owner of each must be a capable farmer or professional man financially able to carry out the project well. A good example, he must be, so that the whole countryside may see the value of the more beautiful farm dooryard. There is one "Demonstration School" in each county, too—a consolidated school—and there are lectures and movies and suggestions for the smaller schools and for many other community activities.

In the South, Georgia is perhaps doing the most of any one state. There is a "field agent in landscape gardening" who goes about over the state's 60,000 square miles. He visits the farmers who have already made plans for beautifying their places, and right there he makes suggestions for improving and carrying out the plans. For schools and other public work he makes plans and specifications. "And," says the president of the state college, "we could use more men in the field of landscape extension, if we only had the money to pay them."

In another southern state, a home demonstration agent recently made it a club requirement in her county that each member should do something to beautify the foundation of her home. Thus the women became interested. And since most of the houses are built on piers, it meant the building of wall or trellis, or appropriate plantings, and sometimes it meant both building and planting.

In helping folks to own farms and country homes, California is doing a unique work. The farm colony at Durham is becoming known everywhere as a splendid example of rural community development. The department of landscape design of the University of California is helping this work along by the making of townsite plans. The plan for the community center at Durham is a great influence in making farm life more attractive, as it provides meeting place, athletic field, automobile camp, and experimental gardens, laid out most conveniently and artistically.

And then, in the work which Pennsylvania is doing, the keynote again is beauty and service combined. The "bureau of municipalities" of the state gives information and advice about choosing and developing sites for public buildings and parks and parkways and playgrounds. It tries to see that all public improvements are made in such a way that they bring added advantage to those whose homes and business are close by.

These are various parts played by some of the states in the big program. But the greatest part of all, and that in which all states concerned unite their interest, is to stimulate the attention of folks—the farmer, the farmer's wife, the children, the community leader—in making for themselves a better outdoor world in which to live: boosted occasionally, of course, by the city business man, and the neighbors, and the student.

As next in importance to the farm home, take the little country school. Since there is value added to the farm home by having its surroundings more beautiful, is there not an advantage in having the schoolhouse look like something more than a huge cracker box in an open field?

In a certain county of Northern Wisconsin stands a school in a wealth of natural trees and flowers and shrubbery. Through the teacher who loves the out-of-doors, the children are being taught to care for their native plants and flowers, and they learn to love even the ones which are most common on their own home farms. Since the children have also a separate play yard, there is no reason for their carelessly harming the growing things, and thus they are taught an added lesson of respect for property which is not wholly theirs. An ideal country school grounds is this, and although not a demonstration project, it is spreading an influence which is needed throughout the state. It is furthering Wisconsin's plan.

Where the "cut-overs" are being rapidly settled in upper Wisconsin at present, much attention is being paid

(Concluded on page 15)

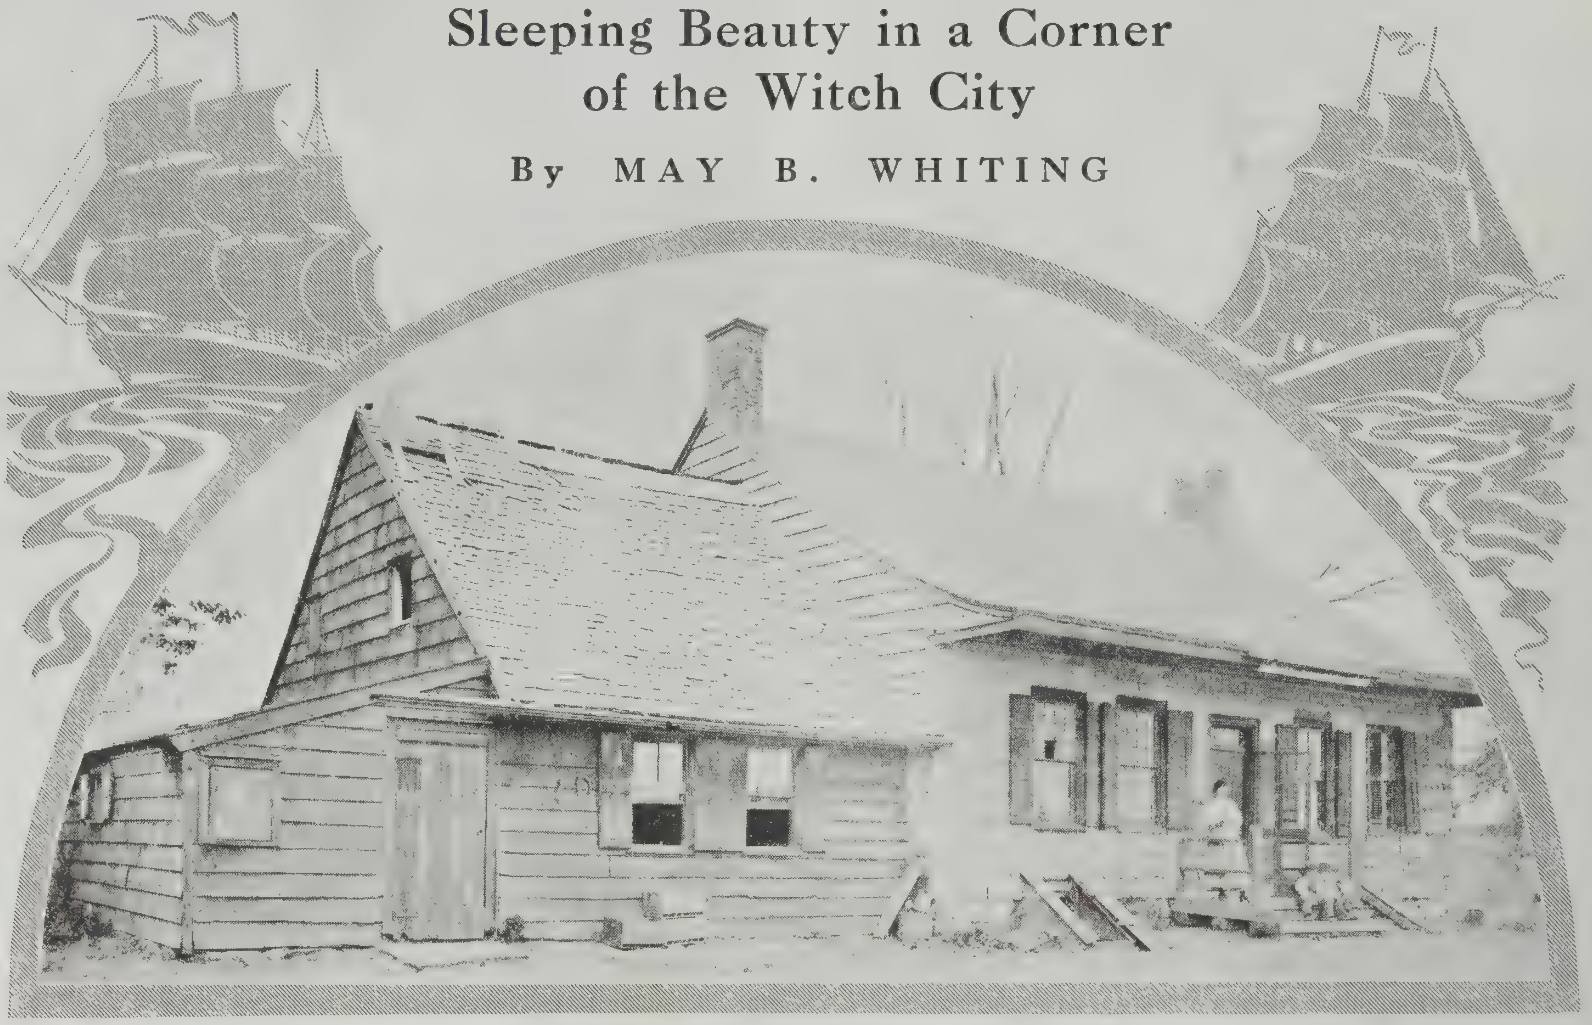
Above—Planting trees along the roadside to bring about greatest beauty and usefulness is a problem that landowners, road engineers and landscape designers should work out together.

Right—A new settler in the cut-over country added these touches of beauty to his home grounds during his first year on the land. It was the direct result of suggestions offered by the extension service of his state college of agriculture.

The Last of the Old Salem Shops

Sleeping Beauty in a Corner of the Witch City

By MAY B. WHITING



The old Wyckoff homestead on Canarsie Road, south of the old Flatlands Neck Road. Now known as the Konwenhaven Place, Flatlands, Brooklyn, New York.

LONG before Miss Hepzibah Pyncheon opened her store in The House of the Seven Gables, shops were a distinctive feature of old Salem. It seems as if every settler made it his ambition to build a lean-to where those of his family, unfit for active labor, might turn an honest penny. Years ago, distinguished tourists found these unique establishments delightful and wrote charmingly about them for the *Atlantic*. But in the last half-century, with the coming of the department store and other uncouth innovations, the little shops have one by one folded their shutters and pined away, a storehouse for forgotten rubbish.

Not that there are not plenty of shops in Salem, of the modern variety, with glaring painted signs, pretending an antiquity to which they have no claim, their windows bright with a foolish display to tempt the passer-by to enter and to buy what perhaps he cannot afford. Not so the real old Salem shop which would scorn to flaunt its wares. You have to know where it is to find it, and then you must look twice or you will pass it by.

And so, if you wish to visit the last survivor of the ancient line, you must follow directions closely. From the station, walk down Essex street, past stately colonial mansions, three-storied, with classic porch, and mediocre modern structures jostling at their elbows. Soon, at your right, you pass the Witch House, dark and frowning, and scarcely more than a stone's throw away on the opposite side, is Mr. Cousin's Art Store.

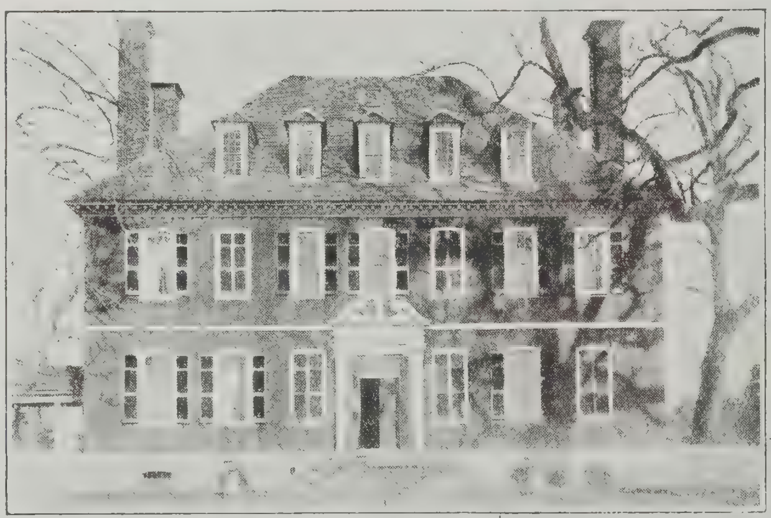
At first the prospect does not seem inviting. It is very evident that the house has a past, perhaps a wicked one. Gambrel-roofed, with small paned windows, it presents a narrow, noncommittal front to the street, but to the rear it stretches itself out rakishly in a tangle of bushes that was once a back yard. There is nothing on the outside to indicate a shop, unless it be a little card, stuck carelessly in a window and not legible from the street, but on the porch at the side there is an empty glass frame that seems encouraging. So you walk down the brick paved way and push open the outer door. Here, at last, is the sign. THIS IS THE PLACE, it reads in clear, black type, and then, completely reassured, you enter.

As you cross the threshold you realize that you are leaving the world of automobiles, of soda fountains, and of movies, very far behind. This is another world, old, very old, not merely with the forty years of its existence, but with the accumulated lore of almost three centuries of little shops behind it.

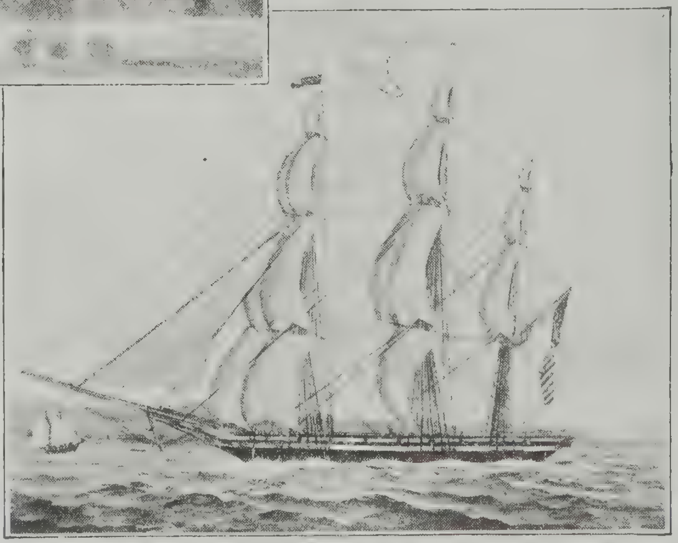
In the half light, made dim by dust and cobweb festoons, you try to make out the surroundings. On the window ledge there are a few flower pots with withered stalks protruding limply from the hardened earth. There is a dish of bulbs, black and wizened things, and dried peach stones on an earthen plate. There seems to be nothing salable in sight, but on a fine old mahogany table there are boxes piled high, and you come close enough to read the labels. "Witchcraft," "footscrapers," "wall paper," "window fasteners" (one *might* buy a window fastener although not in need of one at the moment), "cupolas," "pilasters," and so on, through a mystifying list.

And still there is no one to wait on you. Above your head, in plain sight, is the shop bell. No doubt it used to jangle warningly at the entrance of a customer, but the cord is long since broken. In the darkest corner stands a handsome old-fashioned secretary. Perhaps that has a display. But on its shelves is a collection of minerals, neatly labeled in a fine, painstaking hand. Surely *those* are not for sale. Some one loved them too dearly.

At last, with shuffling step, the proprietor enters, appearing suddenly from some recess of the rambling old house. He takes his place behind the counter with much seriousness and surveys you contemplatively. He is such a proprietor as the last of old Salem shops ought to have, a big man, past seventy, whose countenance shows only lines of gentleness and the luster of whose dark eyes the cares of this world have not dimmed. Slowly he takes out his spectacles and puts them on. They are magic spectacles with only one lens and by them he can tell whether you are a person of sufficient intelligence to warrant his bringing out his wares. The examination over, he asks in a low, musical voice, well suited to the silence of the shop, "And what pictures can I show you today?"



The main building at Westover, James River, Virginia, was built in 1737. Theodore Roosevelt said he did not know there was so fine a house in America.



Ship *George*, Thomas West Master, from Calcutta. Off Cape Ann, bound to Salem, Massachusetts, in 1820.

Before you can get your wits together for a reply, his partner enters. (You know it always took two people to keep a shop. There was the Button Shop of the Misses So-and-So, and poor Hepzibah with her brother Clifford.) The partner is a woman, a frail little body, nowhere near reaching the shoulders of the proprietor. With noiseless step, but with a peculiar directness of movement she glides into the room, takes her place beside him, and fixes blue, unwinking eyes upon you. Then you draw a little gasp of surprise. This partner is blind!

"A new customer, sister Hattie," says the proprietor with infinite tenderness. Then to you again, "What pictures shall I show you?"

With a little start you come to. To ask for "views" seems too commonplace. You look at the walls for inspiration, catch a glimpse of a faded photograph, and murmur, "Ships."

"Ships," repeats the proprietor. "Have we any ships, Hattie?"

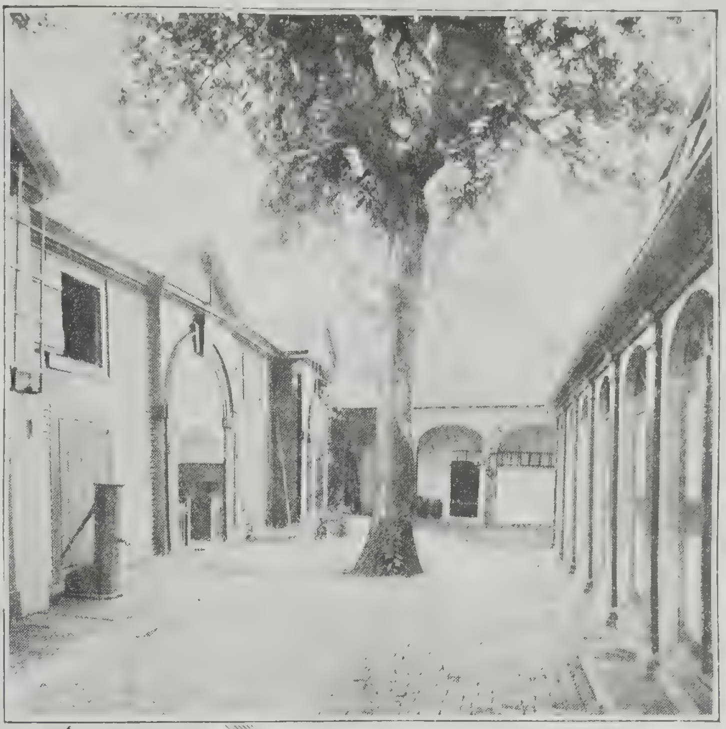
A thin little laugh greets this question. "We've got lots of ships. They're on the right-hand side of the chimney cupboard."

"So they are," agrees the proprietor and opens a door of a closet that runs back the length of the chimney. Years ago it held logs for the fireplace. Now it is piled high with boxes. The proprietor carefully selects one and blows the dust off.

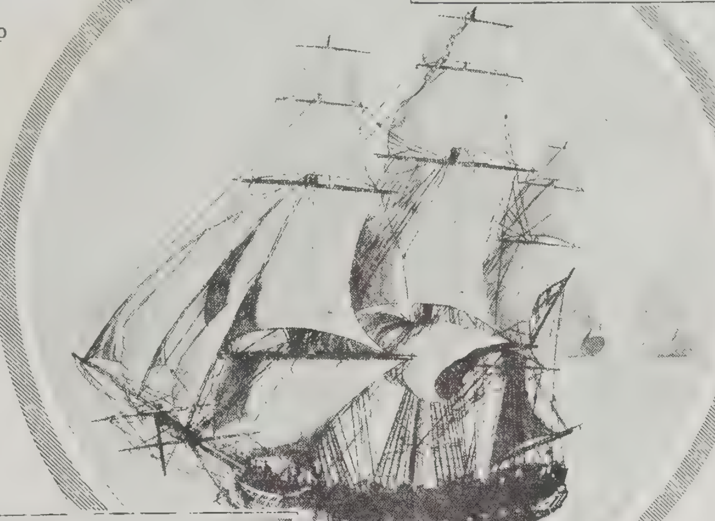
"I haven't been over my ships lately and I'm not sure how many hundred I have, but here's some of old Salem." Then he takes them out, one by one, naming them over as he lays them on the counter.

"Here's the *Light Horse* that opened up trade with Russia, and the *Grand Turk* that went to Batavia. This is the *Atlantic* that took the flag first to Bombay and there's the good ship *George* with her. Here's the *Margaret* that first went to Japan and the *Rajah* that made the whole world look to Salem for its pepper. Here's the *Come Along Polly* and the privateer *America.*" Then with a little sigh, "When those ships were on the seas, Salem was the foremost port in the New World."

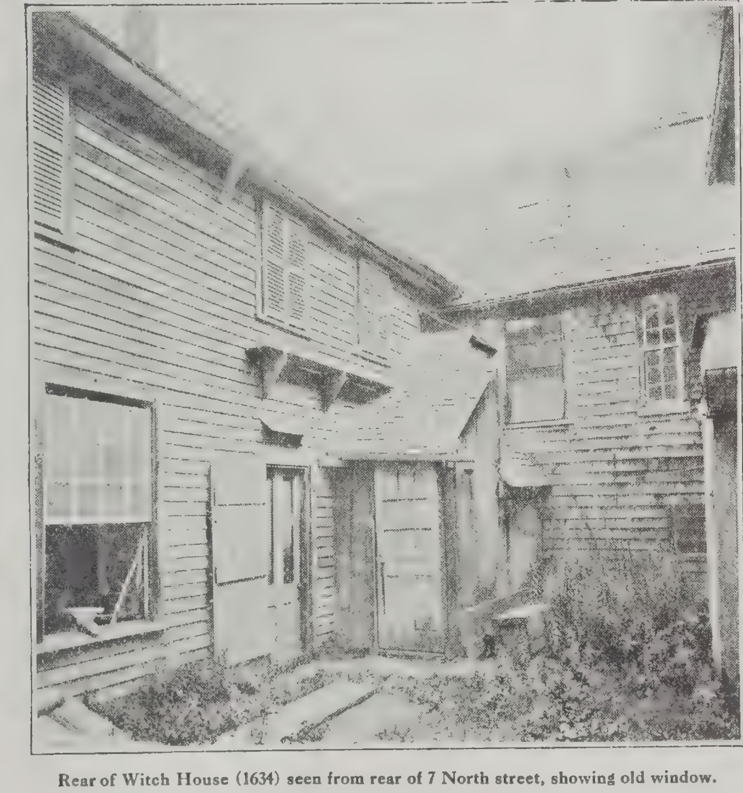
"And here's the *Mount Vernon,"* he continued after a moment. *"She* was a lovely ship. She carried twenty gun and fifty men and a carload of sugar to the Mediterranean. She had to fight off French cruisers all the way. But she did it and she exchanged her cargo for wine and silks and brought back $100,000 profit for her owners. Those were the kind of men they were."



The English courtyard of the Pierce-Nichols House, 80 Federal street, Salem, 1782.



Ship *Mount Vernon* of Salem, Massachusetts, 1798.



Rear of Witch House (1634) seen from rear of 7 North street, showing old window.

"It must have been hard on the women folks at home," mused Miss Hattie.

"She was Elias Derby's last venture. He promoted 45 cabin boys to be captains and left the biggest fortune in the country. But of course there was some bloodshed and considerable evading of laws, I suspect."

By this time your interest is shifted from the pictures to the gentle-voiced proprietor; still handling them over with loving fingers. "Perhaps you are of that race of seamen that made America known?"

"Most old families in Salem are," he answered simply. "My father was a seafaring man. But don't you want to see some porches? I have hundreds of them. These are of Salem, which has the finest architectural streets in the country."

And then, as if by magic, there blossoms in the dinginess the beauty of classic arch, with pure Ionic and Corinthian columns, Georgian gateposts, and wrought iron, delicate as lace, so that the drab little shop is quite transfigured.

"Strange how some folks never get their deserts in this world," mused the owner. "Did you ever hear of the McIntires? You never did! And they were the greatest family of architects and builders we ever had, but no one wrote about them. There's Paul Revere. He was a good workman and he rode to Lexington. And Shem Drowne. He did some carving and Hawthorne made up a story about him. There's Charles Bulfinch. He was a tasty man and had rich friends and a daughter who wrote down every move he made. But none of them were geniuses like the McIntires. The whole of them, brothers and uncles and cousins. worked together, and the flower of the family was Samuel. He made the most beautiful face of Washington that was ever done, I think. Carved it in wood, too For fifty years it was over our Common gate, and now it's in the Essex Institute. Everything they did was good, fences and all. Take the fence of this Pierce-Nichols house. It's worth a trip to Salem to see that alone."

"And the furniture in that house," piped up Miss Hattie.. "It would make your eyes stick out to see it, all carved, and Chinese chairs and such."

"They furnished them from the four corners of the world," agreed her brother. "But think of the times in which they lived. There's no romance in the world today," and he stares at you so fixedly that you fear he will read the denial of his statement in your eyes. *"Then* the streets of Salem were like a bazaar, with silks and spices and jade and ivory in the storehouses, and parrots and monkeys in the shops, and sailors with pigtails and earrings, and sail lofts where it was dim and cool, and captains walking the streets like kings—"

"And one of them married a Chinese wife," chirped in Miss Hattie, "real Chinese, and high caste, too. And he brought her home to Salem and she's buried in the Charter Street Cemetery with Governor Bradstreet and all the rest. I've seen her grave. It must have been kind of sad living here for her. Lots of folks have sad lives."

Then a little hush falls over the shop. The proprietor and his sister seem absorbed in their own thoughts, and you have a panicky feeling that somehow the spell may break. You try to think of something to say that may prolong it.

"You must have taken many photographs," you remark at random.

"Thousands of them. Southern colonial, Dutch colonial. I have them all. Whenever I hear of anything beautiful I go and get it. I have never been to Europe but I have 100,000 photographs of galleries and works of art of the Old World. But I like American things best. I'm an authority on colonial affairs."

The magic of the witch city again! An authority in an obscure corner.

"All the architects know me," he continued, "that is, the best ones. I only sell my pictures to the best. You'll find my photographs in the Congressional Library, the Metropolitan Museum, Columbia University, and almost everywhere you go."

Miss Hattie had been standing by, an absorbed listener. "Tell about when you sold to J. Pierpont Morgan," she said in her thin little voice.

"That *was* queer," reflected the proprietor, a bit shamefaced. "I don't know what made me say it. I opened a box and he took out, say a hundred, and ran them under his thumb as you might a pack of playing cards. I don't know how it happened, but I took them out of his hands and said, 'I'm no salesman, Mr. Morgan.'"

Miss Hattie answered with thin, eerie laugh. "And then what did he say?" she asked.

"He said he'd take two hundred and how much would they cost him." And then to you, "Have you found some that please you?"

A trifle bewildered, you make a random choice, and, as the active partner is doing them up, Miss Hattie suggests rather wistfully that you might like to visit the garden. With eyes still dazed, you make your way down the weed-choked path that leads to the rear of the house.

Dear Miss Hattie! Your garden is a wilderness beside which Miss Hepzibah's, in "The House of the Seven Gables," was a paradise of order. There is no trace of the paths that once wound between its beds of yellow lilies and snapdragon. The creeping Jenny and the ramblers have scaled the shrubs and the pear tree, and cast out long feelers over the tops of the phlox and larkspur.

But although it is neglected and almost forgotten, the summer finds it, and its scattered blossoms greet the visitor with more of sweetness and of courage than those of the well-kept gardens across the way.

Manhattan, the Wise? World Knows It as Hick

It's Little Old N'Yawk That Falls the Hardest for Green Goods

By PETER SCHUYLER

SOME years ago a young man with the urge to show up the Great Middle West dashed off a novel of deadly serious satire and called it "Main Street." He laid the scene in the hypothetical village of Gopher Prairie. After the book had been catapulted into the class of best sellers and everyone had stopped talking about it, Manhattan turned its languid attention to the pages and read them, laughing heartily at the strange people of the strange western community.

When a play, a very bad one, was whacked out of the cavortings of Carol Kennicott and her roughnecked medico husband, Manhattan dropped in to see the drama. Again it laughed heartily at the goings-on of the weird people of Gopher Prairie. Some of its interest may have been due to the fact that one of the most notorious gang of thugs Manhattan had ever raised was known as "The Gophers." Perhaps it expected the drama to contain a scene or two from the playfully murderous wars between the Gophers and the Hudson Dusters, another collection of street bandits whose campaigns had uplifted the front pages of the newspapers on more than one occasion.

Know the Town as It Is

ALL the time Manhattan was laughing uproariously at both book and play it was cheerfully ignorant of the truth that Manhattan itself, and not Gopher Prairie, is the original, simon-pure Main Street. Even if it did discover itself for what it is, Manhattan would not only conceal the discovery but vociferously deny that it had ever happened. Manhattan must, at all costs, preserve its reputation for "wiseness" though all the world realize that it is nothing but the hickiest of hick villages when it comes to things, persons, and happenings outside the confines of two of the five boroughs of Greater New York. For all the impression they make on Manhattan the villages of Brooklyn, Queens, and Richmond might just as well be Finisterre, Philadelphia, or Terre del Fuego. Nothing exists for Manhattan except Manhattan. Only occasionally is the human beehive, called the Bronx, permitted a casual nod of recognition; as, for instance, when a lady in a fit of pique shoots her cavalier into the morgue or a gentleman wearies of his wife and buries her among the pansies in the front yard. Even then such little pleasantries must not happen too far uptown if they would receive even passing notice.

The process whereby Manhattan has acquired and preserves its reputation for wiseness is an extraordinarily simple one. It refuses to believe that anything of importance can happen, or anyone worth while can exist, outside its limits. It considers, in spite of millions of daily proofs to the contrary, that all the human oddities it views necessarily come from somewhere else.

"They Talked—Loudly"

I SAW an illuminating example of the latter viewpoint the other night in one of Manhattan's smartest dining and dance places. At the table on the right, next to mine, was a group that declared to high heaven in every word, gesture, syllable, and article of wearing apparel, that it was one hundred per cent Manhattanese. A bushel basket would scarcely hold the women's jewels though a vanity box might comfortably house their gowns. They smoked like Pittsburgh's chimneys and they talked interminably loudly and authoritatively, when they were not eating or drinking. The whole world was their gridiron and they toasted on it all and sundry who were not of Manhattan. The men, like the men of Manhattan, simply sat and waited for the check. The other people in the place afforded inexhaustible fodder for sarcastic comment. All who were not instantly identified as true natives were flopped into the conversational frying pan and done to a crisp. One lady, in a burst of inspiration, created a new game and the group proceeded to play it with vigor and loudness. As each pair of dancers jazzed past each one, the occupants of the table called out the name of the city or state or village from which they judged the male dancer to have come. Whoever shouted the funniest sounding place was chosen the winner and was privileged to order carte blanche from the waiter's hip. One weary-eyed young man won with startling regularity and he was finally implored to tell his system. He explained boredly, that it was all a question of hair. If a man wore his hair cut round in the back after the model of the festive soup bowl, he came from one place. If the neck fringe was trimmed in a straight square he came from another. Valentino sideburns indicated that the home town of their owner was north of the Mason-Dixon Line. The semi-scalping cut, known as the Army and Navy Special, proved conclusively that its owner hailed from the far Northwest. His ability to identify all the varieties that whirled past indicated a marvelous ingenuity and an extraordinary knowledge of strange sounding places in the weary-eyed youth, but beyond merely announcing his system he refused to go into further particulars.

About one-thirty in the morning, a man with a long and magnificent white beard entered and sat down at the table on my left. Instantly the home-town guessers focused their attention on him. While he ordered his meal the contest to determine his domicile raged and I learned more about geography in fifteen minutes than I ever dreamed possible. Having informed the waiter in no uncertain manner what he wanted to eat, the elderly gentleman with the magnificent beard sat back, combed his whiskers contemplatively, and appeared to enjoy the spectacle wiggling on the dance floor. Fiercer and fiercer waxed the game at the table on my right. The weary-eyed young man for once was stumped, although he ranged the globe from pole to pole. At last the waiter appeared with the old gentleman's food, and after depositing it carefully on the table, flipped open a napkin with a flourish and extended it to the prospective eater who eyed it as if it were something he had never seen before. The waiter indulged in another flourish of the napkin. His purpose seemed to burst suddenly on the old gentleman with the flowing foliage, for he waved away the fluttering temptation. Then parting his beard carefully he drew the two sections of it through the arm holes of his vest, tied the ends in a perfect lover's knot over his shirt front, picked up his knife and fork, and went to work with no more nonsense. Consternation reigned among the speculators on my right. It looked as if they were coming to blows, so heated became the debate. Wagers of money were made, the weary-eyed young man plunging heavily on his conviction that the man with the whisker napkin was from Salt Lake City.

The Answer Unexpected

TO REACH an agreement devoid of blackened eyes and bloodied noses seemed impossible, so it was decided to appoint a committee of two to wait on the old gentleman and settle the dispute. The weary-eyed young man and a lady with four chins were appointed. They approached the victim just as he was finishing a large slab of apple pie and an hunk of American cheese.

"Pardon me, sir," led off the male member of the committee.

"Go as far as you like!" said the old gentleman amiably.

"My friends and I have just made a little bet about your home town," explained the young man. "They say you are from Kansas and I think you are from Salt Lake City. Am I right?"

Rising angrily from his chair the old gentleman roared his reply. "Kansas? Salt Lake City? What do you mean, you young upstart! I was born in Manhattan and this is the farthest uptown I have been in fifty-five years."

* * *

Lately I have been reading the biography of P. T. Barnum, written by M. H. Werner, and have been impressed by the fact that "The Prince of Humbugs" realized just how easy it was to fool "wise" Manhattan. For Manhattan was "wise" further back than the memory of man runneth. Barnum knew it and worked that wisdom for every nickel in it. Observe the case of his exploitation of Jenny Lind, whom he had neither seen nor heard until he met her at the boat landing when she arrived.

Months before the thousands gathered to bellow their enthusiasm for "The Swedish Nightingale" to the skies at the foot of Canal street that beautiful Sunday afternoon, September 1, 1850, Barnum had worked the gullibles of Manhattan to the pinnacle of expectancy. Reams of editorial and reportorial bosh had been published by the newspapers, for then as now the "wisest" and easiest of all Manhattan's creatures is its daily press. The journals of the day erupted with superlatives, all furnished by the astute Mr. Barnum who had gambled $187,500 on an operatic lady whose chief claim to public appreciation, as far as he knew, lay in the fact that she had contributed large sums of money to sundry European charities. Gambled is hardly the correct word, because Barnum, better than anyone who ever lived in America, until the time of Morris Gest, knew that he was taking no chances on the Manhattanites who had paid so famously for the privilege of viewing General Tom Thumb, the Fejee Mermaid, and The Woolly Horse Lost by Colonel John C. Fremont in the Rocky Mountains. How well he knew is demonstrated by the box-office returns for Jenny Lind's first New York engagement of six concerts, which were more than $87,000.

"But all this was long ago when we were not so wise as we are now," retorts the special pleader for the sapience of the Manhattanites. Is that so? Let's have a look. What Barnum did in 1850, Morris Gest repeated last year with the Moscow Art Theater. Mr. Gest probably knew more about the Muscovite actors than Mr. Barnum did about Jenny Lind's high C, because they came from his neck of the woods. But Mr. Gest followed Mr. Barnum's scheme exactly. For months before the Russians arrived, the papers were larded with notices about them and their histrionic powers. They were the best trained, the most talented group of performers ever seen by the eye of man—or woman! One day they were announced as being on their way. The next morning brought the appalling news that they might not come after all! The Soviet government could not spare them! It was afraid that if they were permitted to leave Moscow they would play hooky and never return and what would dear Russia do then, poor thing!

Smoking It Up for Morrie

AS IN the case of the Swedish singer, the press of Manhattan was the first to sound the call for all true local intellectuals to come to the aid of the city and show the Moscow Art Theater that Manhattan knew a good thing when it was told it was a good thing. The dramatic critics outdid one another in the effort to say the most extravagant things about the art of the invading troupe. Gentlemen, whose acquaintance with things Russian was confined to the strict limits of a tiny of imitation caviar, exploded erudition by the column. What is called, in the business of prize fighting, "smoking up a match" was pursued by the individuals interested in raiding Manhattan's pocketbook, with vast success. While there were not thirty thousand persons waiting for the boat containing the Russians to come in, as there were when Jenny Lind sailed up the bay, the crowd that stormed the theater the night of the première was enthusiastic enough to satisfy even Mr. Gest.

The night the Swedish Nightingale sang for the first time at Castle Garden the audience was a volcano of enthusiasm from the beginning to the end of her program. The evening the Moscow Art Theater uncorked its gutturals at the Jolson the reception they received was proportionately as hilarious. The ticket holders, who had paid through the nose for the privilege of attending the performance, almost raised the roof with their plaudits, although ninety-eight out of a hundred of them did not understand a word of what was being said upon the stage. The dramatic critics swooned in ecstacy by groups in the lobby after the first act and remained in that state until the engagement of the company ended. The Manhattan money cow having been milked dry after some weeks, the troupe was hauled off to the provinces where people looked longer at ten dollars than they do at hyperbolical press notices, and where its stay was short.

Where Do the Nebs Live?

BUT the result had been accomplished as far as Manhattan was concerned. Once again it had shown how "wise" it was by paying exorbitant prices to see what was only a good stock company do a lot of plays which might just as well have been done in the Siamese language. It was only when the aggregation had left the Statue of Liberty in its wake that Manhattan awoke to the cheerful realization that it had been hoodwinked. Then the same Manhattan newspapers began to discover that the idolized Russian players had feet of artistic clay and to withdraw their untempered commendation, just as they had done seventy years ago in Jenny Lind's case. But Mr. Gest, counting up his receipts for the Manhattan engagement, doubtless has decided to hie himself to Timbuktu for another novelty with which to take the money of the "wise" ones this season.

Whether Barnum ever said, "There's a sucker born every minute," will no doubt be the subject of intercollegiate debates some time about the year 2226. But in the meantime one thing is certain: the sucker birth rate in Manhattan is higher than any other place in the civilized or uncivilized world, and it is mounting all the time.

* * *

Every small town has, some time or other, been afflicted by a medical mountebank who breezes into the main street, hires an empty store, and proceeds to cure all the ills of the community with a secret preparation good for man or beast and retailing for a dollar, "not more than one

(Concluded on page 14)

The United States Through Japanese Eyes

By DR. TASUKU HARADA

DR. TASUKU HARADA,

Chairman of the Japanese history, literature and language department of the University of Hawaii, and former president of Doshisha University, Kioto, Japan.

JAPAN owes much to the United States of America for the opening of her country, and for leadership in the advancement of her modern civilization. The United States has been responsible to a large extent for that remarkable transformation which has taken place in Japan during the last sixty years, and which has been called the "miracle of the nineteenth century." The United States has been Japan's kind teacher, unselfish friend and foremost customer. It is, therefore, natural for Japan to entertain good will toward the United States, and to hope that her friendship with America will be lasting.

Japan's good will and her desire for American friendship were not in evidence, however, when the two countries first came into contact. When Japan yielded to America's persuasion to throw open her doors, she did not do it voluntarily; neither did she do it because she was moved by American good sense. She yielded to America's demand because of the strong pressure brought to bear upon her; in other words, she simply had to do it. If Japan had not complied with the wish of the United States, she might have been bombarded by an American fleet, for it is a fact that the United States was ready to take possession of the Loo Choo Islands, and the attitude of the United States at that time was understood by the Japanese to be intimidatory.

England and Russia were rivals in those days for commercial and political expansion in the Far East. Russia, having completed the annexation of Siberia in the eighteenth century, began to threaten Saghalien, and the frequency of Russian ships on the northern coasts of Japan frightened the latter country and caused Japan to feel the immediate necessity of defense against the intrusion of her northern neighbor. Under those circumstances, the entry of Perry's fleet into the Bay of Uraga in 1853 created a great commotion in Yedo, and, in fact, all over Japan. The Shogun's ministers were perplexed; the Imperial Court at Kioto was stirred, and prayers were ordered to be said at all the great national shrines.

No Racial Antipathy

THAT Japan was a hermit nation, isolated and secluded from the rest of the world until sixty years ago, is well known. Moreover, it is true that prejudice and antipathy against aliens were intense. But it should not be understood that such an attitude always has been maintained by the Japanese, either by the government or by the people. At the time of Nobunaga's supremacy, for example, Catholic missionaries were given welcome by him, and by several other daimyos. So much was this true, in fact, that at one time half a dozen daimyos and several hundred thousand of their subjects were counted as Catholic converts. Iyeyasu, in the early part of his administration, offered sites for settlements in a suburb of Yedo for Spanish, Portuguese, English and Dutch traders, giving all of them a great deal of freedom. At that time, the policy of the Japanese Empire was free trade, and Iyeyasu's attitude is well shown by a law enacted in 1602, which says, in part:

"If any foreign vessel, by stress of weather, is obliged to touch at any principality, or to put into any harbor, of Japan, we order that, whatever these foreigners may be, absolutely nothing whatever that belongs to them, or that they may have brought in the ship, shall be taken from them . . . . Likewise, we order, in a general manner, that foreigners may freely reside in any part of Japan they choose, but we rigorously forbid them to propagate their faith."

The last clause suggests the reason for the policy of exclusion so severely carried out by the Tokugawa Shogunate. Missionaries were suspected of being political agents for the exploitation and ultimate possession of the land. It is recorded in one instance that "an indiscreet remark by a European sea captain that his master accomplished foreign conquest by first sending priests to win the people, and then getting possession of the country through the native Christians, had aroused Hideyoshi's suspicion against foreigners in general and Christians in particular."

What I want to make clear is that racial prejudice and national antipathy toward foreigners are not natural temperaments of the Japanese; they are the results of an exclusion policy by the government, and an isolation of the Japanese people by that government, which lasted for more than two and one-half centuries. Fortunately, the political designs of the Spaniards and the Portuguese against Japan were checked. Holland was unable to carry out her territorial ambitions against Japan. But in the nineteenth century, Great Britain, France and Russia began to show the spirit of territorial aggressiveness. India had been annexed to Great Britain in the eighteenth century; Indo-China and Annam had fallen into the hands of France; England had carried her plans into China, taking Hongkong. Japan, apparently, was the next step. Russia, continually watching for an opportunity to come down from the north, had annexed Saghalien, which was claimed by Japan as her rightful domain. Under such circumstances, it is only natural that Japan was in a suspicious mood when she beheld approaching her shores the extraordinary expedition headed by Commander Matthew Calbraith Perry.

But the opening of the country, and the intercourse of the Japanese with the people of the United States, rapidly transformed the feeling of the Japanese toward America. Among the principal causes for this transformation may be cited:

1. The friendly attitude toward Japan of the American diplomats, beginning with Townsend Harris, the first minister. In the matter of revising the treaty to eliminate several unfavorable clauses for Japan, the United States was the first nation which showed her willingness to conclude a new treaty, which surrendered the chief points in dispute.

2. The repayment by the United States of her share of the indemnity demanded by the British, French and Dutch governments, as well as the United States, after the bombardment of Shimonoseki. No single act helped the advancement of good feeling toward the United States more than this. The amount so repayed was used by the Japanese Government for the improvement of the harbor of Yokohama.

3. The realization on the part of Japan that the United States had no aggressive designs against her. It did not require many years for Japan to come to regard America in a different light from that in which she regarded European countries.

4. American professors and teachers in public and private institutions of learning, and missionaries engaged in educational, religious and social work. The number of these educators from America outnumbered those from all other foreign countries put together.

5. The fact that a large number of Japanese educators and publicists have been educated in America, or have been well versed in American ideals. Mori, once the Japanese minister in Washington, later the minister of education, was a great admirer of America, as was also Fukuzawa, founder of Keio University. Neesima, founder of Doshisha, the first Christian university in Japan, at Kioto, is a graduate of Amherst. Baron Yamakawa, president of Tokyo Imperial University until two years ago, is a graduate of Yale. These are only a few among a legion. I may add that many thousands of Japanese youths who studied in the institutions of America are now in important positions in professional, governmental and business life in Japan.

This friendly attitude, I believe, has been more or less reciprocal between the two nations for forty years. At the time of the Chinese-Japanese war, American sentiment was on the side of Japan. During the Russo-Japanese conflict, America was predominantly in favor of Japan. And it was not until after the termination of peace negotiations at Portsmouth, that the situation between the United States and Japan changed completely, in certain sections of the country, and among certain classes of people, at least. The United States began to distrust Japan; Japan began to doubt the friendship of America. At this very time came the discriminatory treatment of Japanese children in California, and the fear prevailed at one time that events might develop seriously between the two countries. At this critical time, the United States sent her entire Pacific fleet to Japan, which was regarded by the Japanese as a demonstration against them. Nevertheless, the American fleet was given a royal welcome by the government and the people of Japan.

The "Gentlemen's Agreement" being concluded in 1908 to the satisfaction of both governments, good will apparently has been restored between the two countries. Anti-Japanese agitation in California has been active since then, however, and has spread somewhat to other Pacific Coast states in recent years. While there is no breach of feeling between individuals, in or of either America or Japan, it appears to me that the countries themselves are drifting apart. For more reasons than one, this is indeed regrettable.

During the World War everything went on quietly, but immediately after the Armistice was signed, the agitation against Japan was started more vigorously than before. Some of her activities before and after the war were made objects of attack and suspicion by the Americans. Japan's annexation of, and her militaristic administration in, Korea; the capture of the German possessions in Shantung; the so-called "Twenty-one Demands" on China; the dispatch of a large army to Siberia; and, more recently, the mandatory over Yap, have been, it seems to me, the principal subjects of discussion and misgiving among the Americans.

How Japanese Argue

"JAPAN has treacherous designs," the Americans argue. "She is militaristic; she is warlike, and always has been warlike. Japanese politicians are not to be trusted, and her business men are unreliable. Her immigrants dislike America, and are 'absolutely unassimilable.'" These and many other arguments, accusations and fulminations are hurled against the Japanese. One has to rub one's eyes, sometimes, in the face of the radical change from bygone years, when the two peoples enjoyed more sympathetic and more happy relations.

"What then," you ask, "does Japan think of America?"

The Japanese people as a whole are as friendly to the United States as ever. Americans in Japan are as safe as Japanese in America, if not safer. Between individuals there is no noticeable difference, but I must regretfully admit that among the people of the intellectual class in Japan, warm friendship toward the Americans has cooled to no small degree. Among the Japanese politicians and publicists, it is undeniable that there is a decided reactionary tendency against the United States.

To be plain and frank, the Japanese may argue about as follows:

"The United States, during the last century, has expanded territorially with remarkable rapidity. In the South, she annexed Texas; in the West, she acquired from Mexico a vast territory, including California and several other states; more recently, she took possession of the Philippines, and Porto Rico from Spain, and annexed Hawaii. She is now laying her hands on islands in the Atlantic and in the Pacific, wielding dominating influence in the two great oceans. We Japanese do not question her methods in effecting these acquisitions and annexations, but the result is the same as with European nations, when they have extended their territories through the practice of imperialism."

"Do Not Condemn Us Alone"

AND so the Japanese protest most vigorously that Japan alone should not be condemned as a nation that is imperialistic.

As regards extension of armaments, the United States has long been held up before the Japanese people as a nation with the expenditure for her army and navy. Here is, they were told, a land where the high ideals of peace and democracy attained their full realization. But the reactionary tendency in America since the World War has been a tremendous disillusionment and disappointment for the Japanese, especially for those who are of a liberal tendency. At one time, the Japanese were told that the United States was planning the largest navy in the world, and we were informed that "almost four-fifths of the total disbursements of the United States Government since 1899 have been for war or for things relating to war." The Japanese, therefore, may claim that theirs is not the only country which is militaristic.

The Americans fear the "Yellow Peril," while the Japanese fear the "White Peril." The Americans talk of Japanese misrule in Korea, while the Japanese point out American mistreatment of the natives in Haiti and the horrible tales of the lynchings of Negroes. The Americans criticize—and I believe rightly—the twenty-one demands on China, while the Japanese point to the American interference in Mexico, in the interests of American capitalists.

These few points may give you some of the angles from which the Japanese observe the United States and things American. You may say that the Japanese are absurd in their conclusions, or that they are utterly ignorant of the true interpretation of American history, and you may be right. But this point should be kept in mind by both Americans and Japanese:

The sympathetic attitude of mind is the first and last requisite for the understanding of a foreign nation. In other words, you have to put yourself in another man's position if you wish to understand him.

The future does not come strictly within my subject, but may I not add that the future of the relations between the United States and Japan depends, I believe, upon the solution of two problems, which may be stated, possibly inadequately, as follows:

1. The extension of armament expenditure is unbearable for Japan. Japan is anxious to reduce it if possible. The rise of liberal and democratic sentiment in recent years demands a considerable reduction of arms, if not total disarmament. It is no longer a negligible element in the politics of Japan.

2. There is, however, a strong military part in Japan, and its fate must be settled before long.

The Washington Conference of 1921 was an outstanding event in American-Japanese relations. It has wonderfully clarified the clouds threatening on the political horizon of the Pacific.

In conclusion, I wish to say that Japan has no desire to insist on the further immigration of laborers into the United States. What Japan hopes to obtain is a fair and indiscriminate treatment for the Japanese who have lawfully entered.

Is the Presidency a Man-killing Job?

Official Work Has Trebled Since the Time of McKinley

By AARON HARDY ULM

TWO weeks before President Harding became ill, Rudolph Forster, who has been on the office staff of the White House for twenty-five years, was asked: "Isn't the job of President becoming too big for one man?"

"It has become a full man-sized job," he replied; and then, with a slight check in his tone: "It is a man-killing job!"

Mr. Forster added that the official work imposed on the President has more than trebled since he became a White House attaché under McKinley. The volume of that work, together with proposals for relieving the occupant of the White House of much of it, is now being widely discussed. Perhaps something will come of these discussions.

This present discussion, however, will concern chiefly another phase of the problem, and possibly its most important phase. It has to do with unnecessary drains upon the energies of the man who happens to be President, drains that are not accountable to official demands upon his time and thought.

As the Harding funeral train made its long run across the continent, or while the body of the deceased President was being duly honored in Washington, numerous persons, with pleased vanity, made remarks like the following:

"Just a few months ago Senator So-and-So took me to the White House to meet the President."

"When I was in Washington as a delegate to the Blank Convention, the President posed for a picture with us, and received us all at the White House."

"Why, I received a letter from the President only a short while ago in reply to one of mine about 'Laddie Boy.'"

It is doubtful if those who can thus boast of kindly and unofficial courtesies shown them by the genial and obliging Harding realize that they had something, and possibly considerable, to do with the recent tragedy in national political life.

The Unnecessary Burdens

IN NO other country are unnecessary burdens put upon public men in the wholesale fashion that is customary in America. The more conspicuous the man and his office, the greater the volume of unofficial burdens imposed upon our public officials. And it reaches almost impossible proportions in the case of the President.

This state of affairs is owing to the tradition that a public officer must prove his democracy by being a good fellow.

This tradition did not adhere to the Presidency in the beginning. George Washington, while the head of the nation, lived in dignified and gentlemanly seclusion. His touch with the general public was of the most formal kind.

His rule of austerity probably was carried too far by his successor, John Adams. Thomas Jefferson perhaps went to the other extreme, but, though he established a legend of democracy, his geniality was of the aristocratic kind. During his and the next several Presidents' terms the White House continued to be free from invasion, by person or by letter, on the part of busybodies.

Andrew Jackson's term at the White House marked the adoption of policies whereby the President became an object of free interest and miscellaneous appeal. The super-democratic note sounded by Jackson first turned the crowds toward the White House and its occupant. A writer of the time said of the multitude that came to Jackson's first inauguration:

"It was like the inundation of the northern barbarians into Rome, save that the tumultuous tide came in from different points of the compass. The West and the South seemed to have precipitated themselves upon the North and overwhelmed it."

In the Days of Jackson

"AT THE first Presidential levee, in the White House," wrote Noah Brooks, the famous newspaper correspondent, "the mob which poured into the mansion to gaze upon the hero and dip into his barrels of punch was so disorderly and riotous that tubs of tipple were carried out of the doors to entice a division of the hungry and thirsty; and broken glasses, soiled furniture and wet carpets proclaimed the advent of the sovereign people."

Jackson's adoption of the spoils system also augmented the toll of energy made upon the President on the score of patronage. Prior to his time new Presidents made changes only in important offices. From then on every new President was expected to see that political friends occupied even minor clerkships in the government service.

Historians generally credit the death of President William Henry Harrison, which occurred one month after the inauguration, to the army of job-seekers which bore down upon him. They allowed him time scarcely for eating and sleeping, not mentioning the important duties of his office. Being an old man and not strong physically he succumbed under the strain.

The tragedy, however, caused no cessation of the continuous attack—first invited by Jackson and permitted by others—on the White House by hordes of persons who wanted to connect with the public pay roll.

Once during the Civil War a visitor calling at the White House found Abraham Lincoln in a state of seemingly mental wretchedness.

"What is the matter?" the President was asked. "Surely the Union Army must have met disaster in the field."

"It is nothing so slight as that," the great Lincoln said, with a forced smile. "What's torturing me is the postmastership at Cross Roads, Indiana."

The assassination of President Garfield by a disappointed job hunter hastened the adoption of the present selective system of filling minor government positions and thus relieved the White House of some of its troubles incident to small patronage.

Woodrow Wilson, however, was the first President who announced on taking office that he would concern himself with no patronage matters which could be handled for him by heads of departments. And in making this announcement he made it clear that he meant the pronunciamento; for he declared that when job hunters forced themselves upon him over the heads of department chiefs, the act would be set down as one prejudicial to their claims.

Since then such patronage as that in the Postoffice Department has been handled altogether by Cabinet members or other sub-executives.

Patronage, however, still lays a heavy toll upon the energies of the President. Small patronage of which the general public rarely hears probably causes more worry and bother than filling important places, like cabinet positions and ambassadorial posts.

For example, in the summer of 1922, Congress authorized the appointment of a new Rent Commission for Washington, D. C. It was to have only two years of life. Yet such a rumpus was raised over who should be the members of the new commission that President Harding was able to make the appointments only as he was leaving on his Alaska trip, nearly a year after the act was passed. Local interests wanted local people named; Senators and national politicians urged the appointment of several applicants living in their bailiwicks outside of Washington. The President had to submit to many interviews and read scores of letters having to do with a matter purely local to Washington.

The more kindly natured a President is, the more such small matters of business tax his energies. The making of nearly every appointment involves grievously disappointing many persons he would be glad to favor.

Even though he be callous about such matters, it is notorious that little items of patronage may cause much trouble in important directions. Since the historic Conkling-Platt episode—the resignation of the two New York United States Senators because President Garfield would not appoint to a job some person they recommended—national politicians haven't dared take their quarrels with the President over patronage to the people. For both Conkling and Platt were defeated when they made their issue with Garfield the platform on which they sought re-election. But a disappointed Senator or a disgruntled leader in the House of Representatives has much more effective and safer ways of getting revenge. He can hamper the President's legislative policies. There is little doubt that several Democratic Congressional leaders who turned on Wilson during his last administration were moved initially in their course by disappointments over patronage matters.

The Pressure of Patronage

OVER the average appointment to office made by the President there probably is ten to a hundred times as much fuss and bother and "pressure" as all true considerations of the public good call for, and in that degree is an excess burden upon his strength. For it the general public is a great deal to blame. Our tendency toward appraising public men on the basis of their ability to "get" is at the root of much of it.

There has been tremendous increase in what might be termed unavoidable work imposed on the President and for which the general public is not to be blamed particularly. It is put upon the President because the Constitution makes him the almost absolute executive of the nation. All Presidents have been jealous of the constitutional attributes of power adhering to the office. Generally they have opposed bitterly any attempt on the part of Congress to subtract from those attributes. The great expansion that has taken place in the national government during the last dozen years has been accompanied by an increasing load of official responsibility on the Presidency.

With this, the unofficial load has grown correspondingly. For as the importance of the office has increased public interest in the man holding it has been enhanced, with the somewhat contradictory result that as his official work has grown in volume the less time he is allowed for attending to official duties. One of the recent Presidents declared wittily that he was not allowed time to be President.

This unofficial load is of two kinds. One might be called semi or extra official. It became established when President Roosevelt undertook to settle a general strike of miners in the anthracite coal regions. Since then it has been taken for granted that any national problem, whether devolving upon it via the Constitution or the Statues, comes within the purview of the Presidency.

There is no reason, however, why the other kind of unofficial Presidential load, and one that constantly has increased, should be made heavier. There is every good reason why it should be lightened.

And for it the general public is wholly responsible, either directly or indirectly. This load might be called the handshaking one, whereby whoever is President is compelled to be a sort of perpetual national show.

The ultra-democratic aspect which Andrew Jackson gave to the Presidency long ago was submerged in strict but necessary rules of a seemingly undemocratic kind. For many years now one who reached the immediate presence of the President had to go through a certain formality. Rules of precedence have much to do with the procedure. The President's time is divided up in advance and apportioned in periods of minutes.

Before entering the White House, Woodrow Wilson announced a return to the "open door" rule of the Jacksonian period. He soon found that it wouldn't work—that if he saw everybody as they came he would have no time for anything else.

In fact, Wilson became, even before his illness—even before we entered the World War—the most secluded of Presidents. The White House grounds even were closed to the public. Regular conferences with the newspaper correspondents and the handshaking periods when almost anyone could meet the President were abandoned.

Wilson Obeyed Physician

IT NOW is known that Wilson's policy of seclusion was formulated by Dr. Grayson, his physician. "They were taking something out of him," he has been quoted as saying of casual visitors to the President's office, and in the interest of the President's health and strength he advised that severe limitations be imposed.

Because Dr. Grayson adopted this sane policy is doubtless the reason Wilson lived to complete his last term and is alive today.

President Harding, being naturally of a "mixing" disposition, said that he found casual meeting with visitors restful and welcomed it. However, there now is good reason to believe that he let his geniality carry him too far in that direction.

Few Presidents in recent times gave more of their energies to the casual social and friendly sides of the office than did Harding. During his occupancy at the White House, rarely did delegates to any convention in Washington fail to be "received" by him at the White House. Almost every day he posed for a picture with some group of visitors, who generally had no legitimate business whatever at the White House offices.

But the purely "handshaking" contacts with others probably isn't the worst part of this kind of needless burden which the general public imposes, or permits to be imposed, on its chief executive.

James Bryce in his "American Commonwealth," written forty years ago, mentioned the growing journalistic surveillance of the President. This in recent times has become torturous; for it no longer applies even chiefly to the President's official performances; it applies with greatest rigor to his personal activities. The newspapers and press associations now maintain on continuous day and night duty at the White House a reporting corps large enough to warrant the maintenance by its members of a duly organized association. To the reporters who merely write have been added a larger number who "shoot"—that is, photograph. These writing and picture-taking vigilantes, the latter with ponderous machines for taking motion as well as still pictures, guard the entrance to the White House offices like armed soldiers on the most important outpost of a military camp.

Hence, not only is the President ever aware that if he sticks his nose outside of his private office the act not only will be written about, but that in an hour or two pictures of his nose will be on the way to newspapers and movie theaters throughout the country.

Public Can Do Much

AND it is the same way when he takes a trip. When he seeks to lose himself for a day or two on the *Mayflower,* the reportorial vigilantes write and "shoot" him off, while others along the course of the President's "pleasure trip" are instructed to keep the yacht under surveillance from shore. They thus tread upon his heels because the public has been trained to believe that anything having to do with the President is "news" and, as such, public property.

This excessive personal interest in our Presidents and other conspicuous public men has been noted by many thoughtful persons as containing an element of danger to the men and to the public good.

"It is in democratic politics that privacy is most neglected, most difficult and most necessary," says Graham Wallas in his book on "Human Nature and Politics." Wallas is a famous English scholar-politician.

"In America," he adds, "all observers are agreed as to the danger which results from looking on a politician as an abstract personification of the will of the people, to whom all citizens have an equal and inalienable right of access and from whom everyone ought to receive an equally warm and sincere welcome."

He explains his contention on the ground of the psychological truth that while a measure of human contact is necessary, too much "mixing" and too little privacy is very damaging to the normal person.

No business man would think of becoming the public slave to which, by reason of a false legend of democracy, the average occupant of the White House is reduced.

The public can do much toward preserving the lives and increasing the efficiency of Presidents. A good way to begin is to develop the habit of looking with disdain on persons who force themselves on the President for no other reason than to be able to boast about the performance. Better still would be a few convincing hints to newspapers and movie show operators to the effect that it is what the President does officially that is important news, and thus make less popular needless news writing and picture-shooting of the President.

Views by Washington Correspondents

T. R. and Taft Always Natural, Thus Easing Strain of Office

By A. R. PINCI

FOLLOWING the announcement of the sudden death of Warren G. Harding at San Francisco, the opinion has been vouchsafed that the modern Presidential pace "kills." Such assertions, made simultaneously by several well-known men, found space in the front page of newspapers. On the whole, it looks as if the charge will be seriously considered and perhaps believed throughout the United States.

But does the Presidency kill? Or is it something else?

This makes timely and pertinent an analysis of fact as to the Presidency as patterned and laid out by our four last Presidents, Roosevelt, Taft, Wilson and Harding. Each in his way, alive or dead, bespeaks a certain tragic characteristic relating to the exalted office as successively held by them—a mental tragedy, as distinguished from McKinley's, which was of violence.

Long experience covering the four past administrations and related campaigns has given me an opportunity to study the Presidency in its two elements—the outgoing and the incoming, and both, it may not be suspected, are decidedly dissimilar, conflicting and the former as wearying and even destructive as the latter is hypnotic and misleading. It is a novel argument that the Presidency is a man-killing job.

Answered by the Presidents

TO BEGIN with, the office is the highest office not only of the land but also of the world. Unlike emperors and kings—even those reputed to be autocratic and absolute—who inherited their office and had to make the best of circumstances, the Presidency of the United States is the open and legitimate goal of any responsible citizen. Many famous Americans have sought it, seek it, and will seek it. It is quite an indictment of such exalted office, therefore, which so many crave and others secretly aspire to, and the remainder dream about, to say that it is as toxic as a slow poison. The fear of death in office certainly is not enough to deter any man from the temptation of becoming a candidate, but that, after all, is not the point. The point is whether or not by evolution or by other method the Presidency today is any worse grind than it was five or ten administrations ago. In fact, is it any more so than it was, say, during Monroe's day? or Lincoln's?

Moreover, has the Presidency become the more burdensome unit by unit, in consonance with the growth of the nation and endless Congressional legislation which makes "the President" the ultimate responsible officer? Or has it become more irksome or fatiguing by simple intensification? Or has it become a difficult and complex job because each incumbent, in his desire to be of service, voluntarily devoted more attention to his office, thereby adding to his own responsibilities?

I shall not answer any of those questions.

They will be answered by the Presidents themselves, so that there shall be no doubt as to what's what.

Theodore Roosevelt, championing the side of the plain people, said that "though the problems are new, though the tasks set before us differ from the tasks set before our fathers who founded and preserved this republic, the spirit in which these tasks must be undertaken and these problems faced, if our duty is to be well done, remains essentially unchanged. We know that self-government is difficult."

William H. Taft said: "Any one who has taken the oath I have just taken must feel a heavy weight of responsibility. If not, he has no conception of the powers and duties of the office upon which he is about to enter, or he is lacking in a proper sense of the obligation which the oath imposes."

Woodrow Wilson, after explaining to me the New Freedom, in an authorized interview in 1912, said: "What gratifies me more than anything else in going about is that if I should be chosen President I will be chosen *something more* than President. I will be chosen the spokesman of my fellow citizens as to the way in which our government ought to be conducted."

Harding Fully Capable

WARREN G. HARDING, who authorized me nearly five months before his nomination to quote him, declared at Marion after the convention was over: "I know that to be President is to engage in difficult work. If I shall be elected the intelligent expression of national opinion I shall welcome as most important assistance. I have a very definite idea about the office, its dignity, what it stands for and its responsibilities. But I am going to be President, distinctly and without reservations."

Perhaps President Harding regarded the office he held more ominously than his predecessors, for as soon as his election was announced he made a formal statement to the effect that he was happy to utter his gratitude but that he was not exultant, adding: "It is all so serious, the obligations are so solemn, that instead of exulting I am more given to prayer to God to make me capable of playing my part."

But any one who has known Harding beyond the conventional handshaking acquaintance knows that he was fully capable, physically and mentally, to measure up to the job. After all, the Presidential office is what its incumbents make it, irrespective of the burdens attaching to it, and neither dead Presidents nor the living ex-Presidents failed from the standpoint of dynamic human capacity to fulfill their executive duties. But as one dispassionately studies the statements made by our recent Presidents the conviction grows that they sought or invited greater responsibilities than the office itself constitutionally provided for. If a President hews the line close to the letter of the law and performs no other duties than those he is called upon to perform he can have a very easy time of it, not unlike some of the figurehead monarchs in constitutional countries where their chief work is to approve routine government measures and then loll back.

Limiting the study to a period of the last score of years it will be found that in politics there exists the ghost of tragedy. Veteran political observers are still of the opinion that President Roosevelt could have had another term in 1908. It was only a short time before that that he admitted regret at what he considered his hasty statement as soon as his victory was assured election night, 1904, that "the wise custom which limits the President to two terms regards the substance and not the form, and under no circumstances will I be a candidate for and accept the nomination for another."

Whereupon the Presidential mantle was draped upon the ample shoulders of Mr. Taft, who thus stepped into the Presidency with very little effort, in 1908. But alas! 1912 was in the offing. That was a bitter year for Roosevelt and for Taft. It ground both of them down. When President Taft received me at the White House one sultry August morning at the height of the campaign he was no longer the Taft I had known as Secretary of War. His smile was gone; the Presidency had left him limp. His smile was gone as Senator Harding's smile no longer graced his Presidential lips. Taft's tariff and Winona were comparable to Wilson's League of Nations and Versailles; both led to defeat, defeat with sorrow, the kind that sears the soul.

Thus the Wilson victory was erected upon the collapse of Roosevelt and Taft. The 1916 campaign, which would have been humorous in its results had it taken place in a world at peace, may be discounted. But 1920 repeats history. Harding rose as Wilson fell. Long before physical misfortune overtook President Wilson the office had hardened him and made him a man of mystery, almost.

Has it been realized that President Harding succumbed, in relation to administrative term, at almost the same time, and under almost identical circumstances, as President Wilson was struck? It has been said that President Harding was an overworked man. Granting that, what should have been said of President Wilson at the time? No one said that it was work, back in 1919. Nor can there be any doubt that after six years of Presidency, five of which with half the world at war and eighteen months of that with this country at war, Woodrow Wilson had been an overworked man, yet no one said so. Moreover, from his aloofness President Wilson plainly showed that he was not really overburdened by the cares of office, nor by the ravages of a consuming and difficult war, nor overtaxed by his repeated attempts to be peacemaker—attempts which were voluntary and extraneous, as was Roosevelt's Portsmouth coup.

A Tonic for Wilson

IN FACT, President Wilson begat a certain spiritual strength, noticeably absent in 1915 and 1916, as soon as foreign countries began to regard him seriously as the new spokesman. The sheer pleasure derived from his new greatness was a tonic. In the same sense President Harding derived immense satisfaction from two official acts in his unfinished administration; one the limitation of armament conference, which France ratified in time to please its author, and the other the funding of the British war debt to the United States. Likewise did President Taft derive unmitigated satisfaction from the arbitration treaties with France and England, in spite of their rejection by the Senate. We have the word of every philosopher and teacher from time immemorial that work as work never hurt any one, and that congenial work, on the other hand, is not to be surpassed as a vehicle to happiness and contentment.

Thus the Presidency, given its dignity, its honor, its fame, its power, cannot involve *per se* murderous work. The danger lies elsewhere—in the politics of the office, and that quality is a constituent of the office itself. It is not possible to remove the politics, which can be traced all along the line, from the President as chief to the least known party men.

President Harding really succumbed at the very outset of this negative political manifestation. A year ago, when he first considered seriously the visit to Alaska, he would have set out upon it there and then with boyish glee and been all the better physically for it. But a year in a Presidential administration makes a difference. Whereas in 1922 he was yet the new President, but a year in office, in the summer of 1923 he was the old President who had to defend his title and office against encroachments. I doubt very much that he ever felt that he would be obliged to be President and on the defensive.

What is there more poignant than the remembrance of President Wilson racing to the United States from the Versailles peace-table in March, 1919, racing against time and against the Senate's hostility and against, when he collapsed, a confused electoral voice? Yet that incident, which led to the famous round robin, in which Senator Harding participated, which was gall to one became a godsend to another.

President Harding was quite hurt by the suspicions attaching to his trip West. Alaska was the goal, some may remember, of President Wilson, who hoped to visit that distant territory some time, but the World War interfered and it virtually passed from his scheme of things after he signed the Alaska Railroad Bill. Just before that Alaska had figured in journalistic space as the bone of contention between alleged predatory interests and political henchmen. Mr. Harding revived interest in it, but somehow there was no response. Alaska was all right, but! That *but* was formidable. Prominent editors uttered it. Politicians howled it.

By the time President Harding started out the trip had lost every vestige of temptation. I have been told that twice he was on the verge of canceling it. Of the press correspondents who set out with the party, many had dropped off on the way to the coast, and this obvious proof of indifference, coupled with the sort of quite unanimous dispatches attesting to lack of popular enthusiasm, must have secretly affected him.

It has been alleged—just as has been alleged of Mr. Wilson—that President Harding was a "very calm man." That shows how well fooled were those from whom he masked his true feelings. Mr. Roosevelt was touchy in many ways while Mr. Taft was tolerant in a judicial way, but Mr. Wilson and Mr. Harding were at one with respect to supersensitiveness. Perhaps this quality was not so apparent in earlier days, but the Presidency intensified it and later sharply defined it.

Both Roosevelt and Taft were their natural selves at all times, whereby they evaded psychological strain. But Wilson and Harding, by restraining their supersensitiveness, encouraged such strain, and supersensitiveness is all the more dangerous to body and life when checked for the sake of appearances or "atmosphere."

Presidents are visible—ocularly—to visitors only on occasions, during which every trace of individualism is smothered if not effaced; and even privileged callers meet them "on parade." So far as is known, no emperor, king, president, regent or other similar authority has officially had a *fit of irritation, bad humor or something like either.* They are "indisposed." Calmness goes to the winds—and all engagements, if any, are called off. That is the incontestable and unappealable prerogative of the office.

'Twould Be a Good Story

I HAVE dropped around the White House quite frequently during the last twenty years, but I do not remember of any official announcement being made that any President was in bad humor or agitated. There were hints, and friends of the Presidents have admitted that they found the Executive "up in the air," "mad as a hornet," "pacing the room like an angry bull," "uncommunicative and aloof," or some intermediate stage of feeling within the circumscribed and described limits.

Perhaps it might be refreshing to read some Washington news correspondence starting out with the information that the President was letting off steam—that he was a human being—and that he was in the office in the worst possible humor. It is beyond imagination that a man can live four or eight years, some under violent strain, without once being off color.

President Wilson modified the old routine of visitors by admitting as few as possible and eventually none at all, and he eliminated the New Year's public reception and all mass handshaking. President Taft modified the Rooseveltian glad hand by radically curtailing the visiting lists, especially at the official functions. When I found myself at the first diplomatic reception given by the Tafts, the East Room seemed relatively deserted in comparison to the crowd that had held forth at a similar state reception under Roosevelt the year before.

Roosevelt was very strenuous; so much so that between the strenuous life he led and the simple life he preached, the average American boy who wanted to be like Roosevelt did not know which hint to follow. Taft made as much of the huge and gawky steam motor car that left its trailing meteoric plume behind as his predecessor made of the horse, and the latter liked tennis as much as the other liked golf. Wilson was indeed the least spectacular in the way of amusement. His customary motor ride, weekly vaudeville, and the game of golf sufficed him. Harding played too, golf, motor, houseboating and the East Room movies, plus some less formal entertainment traceable to Marion days and editorial fashions.

Single Term Would Help

THE day varied in the case of each President, but in general all have been early risers. Sometimes an hour or two of amusement or recreation followed the breakfast and preceded the day's work, and visitors' hours have been set between ten and one, occasionally anticipating and often retarding. Mass meetings, delegations and congresses have always been assigned, with a few notable exceptions, to the afternoon hours.

Luncheon may be work and it may be recreation, depending upon the circumstances. But a great deal has often been accomplished by Presidents at the luncheon table in two hours that would have failed of accomplishment in as many days a few yards away. Even the dinner has been utilized for shop talk—and miraculous results have followed such nocturnal repasts.

The private library, of course, is the ultimate place where every President labored most and where he really solved or disposed of most of his serious problems. There he had no hours. But it would be outside the mark to allege that these quiet hours of study were enervating or unpleasant or fatal. I dare say that as much enjoyment and interest grew out of such restful labors as each man was capable of extracting.

Emergencies have existed where Presidents were up nearly all night. For example, President Harding sat up until nearly four o'clock in the morning writing the message which he read to the Senate when he delivered, later that day, the treaties of the arms conference. But to an old-time editor, what's four o'clock in the morning writing copy?

A late serious development of the Presidency is its alleged aloofness and distance and immiscibility in that which pertains to friendship and the human equation.

Dictatorship May Mark the End of Mussolini

Concluded from page 6

while the lack of colonies will always place Italy in a disadvantageous position. These considerations and the feeling prevailing in the mind of every Italian that the Treaty of Versailles did not give to Italy a sufficiently big share of war spoils, must necessarily be of primary importance in shaping Italy's foreign policy of the future.

The dominating characteristic of Mussolini's tactics thus far has been this: Whenever two opposite groups of interests were in conflict, he has absorbed them both. His first resource in his war against the Socialist party, which immediately after the World War had started a well-organized campaign aiming at the destruction of the nationalistic spirit borne out of the war, was that group of patriotic, nationalistic Socialists headed by Bissolati, who, in 1914, had separated themselves from the Socialist party and had entered the war against Austria.

Nobody knew better than Mussolini who, until 1914, had been one of their leaders, that the Italian Socialist coalition of party and federation was only a political phantom, a vast bureaucracy of labor leaders who talked the language of revolution while having neither the courage nor the ability to seize the government. When the populace seized the factories and part of the land, the capitalistic class turned to Mussolini for help.

Premier Giolitti, who during forty years of political life had played one party against the other and had always succeeded in preventing one party from taking control of the government, thought that in this case also the old game could be safely played and the Fascisti were given a free hand to break up by force the labor unions. In this case, however, the "old fox" had met his match in Mussolini. Mussolini succeeded in breaking up the labor unions with the moral and material support of the government and with the financial support of large industrial and financial interests that wanted organized labor stamped out in Italy. However, he made such glittering promises, which included everything from better hours for labor to division of the land, that the average peasant and laborer, who followed socialism and the other political parties only for the sake of personal gain, deserted the Socialist party and went over to Fascismo. This brought about the collapse of the Socialist Colossus and only a minority of convinced Socialists, loyal to the international proletarian idea, went over to Communism.

When the government wanted to call off the Fascisti it was too late. Giolitti had played with fire, as had Nitti before him. Nitti, when seeking to use labor to forward his own political ambitions, suddenly found that labor was stronger than he, and in June, 1920, the Socialists forced Nitti out of office. Giolitti made the same error with Mussolini. When the government sought to check the progress of Fascismo, the Fascisti were beyond control and Mussolini had won the struggle by adopting his characteristic tactics: He had enlisted in the Fascisti movement both the proletarians and the capitalists.

While the Socialists were taking over the factories in the North, the peasants in the South were taking over the land. In this case, also, the landlords entered Fascismo to destroy the organization of farm hands. Mussolini included in the Fascisti program the very same agrarian reforms that the peasants were trying to obtain through their organizations, and thus, in this case he eliminated the conflict between landlords and farm hands by swallowing them both into the Fascisti movement.

The Fascisti program could not fail to attract to Fascismo the Nationalist party, which, as I have said before, is the exponent of a large mass of intellectuals and is supported by a powerful combination of industrial and financial interests grouped around a program of foreign policy leading to imperialistic wars of conquest. Reactionary clericalism went over to Fascismo on much the same terms as reactionary nationalism, and they both supplied Mussolini with unlimited financial means for arming and equipping a powerful and well-disciplined army that on October 30, of last year, marched through the ancient Flamarian Gate, now the Porta del Popolo, into the capital of Italy and established the Fascisti dictatorship.

Mussolini has succeeded in reducing the deficit in the budget with drastic methods of economy. Loans, taxes and reduction of armaments have eased greatly the strained financial situation. The state railways, together with the postal, telegraph, and telephone services which have been decidedly in the deficit class, seem to be headed toward private ownership. The limit of reasonableness has been reached if not exceeded by the law authorizing the state to confiscate all excess war profits. Certain large fortunes are now paying a maximum of fifty per cent and the revenue derived from taxation represents more than eighteen per cent of the national income, a high figure for a country like Italy.

The conservative element which represents the large majority of the nation is, without any question, behind Mussolini and will support him to the limit, provided, however, he does not go too far in his dictatorial methods of government which have practically abolished any appearance of liberty. Italy is not a country where dictators live long enough to break the will of a race that has never been conquered. Dictators and Tribunes in Italy have always paid with their lives for the short-termed satisfaction of imposing their will upon a race that has been accustomed for centuries to assassinate rulers who go too far. In my estimation, Mussolini is flirting with death and he knows it. I know the man, and I know that the thought of his personal danger will not make him deviate an inch from the road he is traveling. On the contrary, such a thought will considerably stiffen him in the resolve to crush all resistance and sweep aside all obstacles. He is a fighter and a leader of men, who, in spite of the fact that as the exponent of Fascismo he is today the defender of the nationalist idea, has not changed the methods that he pursued when he was the enemy of the nation. Individual liberty is an empty word under any dictatorial form of government, no matter if it is the dictature of the proletariat or the Fascismo. The trouble, however, is that Italians will never submit for a long time to a dictator, no matter if he be a Lenin or a Mussolini, and this is one of the dangers of the present situation in Italy. Another dangerous situation is created by the conflicting interests and opposing tendencies existing in the Fascisti movement. Note the split with the Catholics and the secession of forty thousand Fascisti in Naples and adjacent districts—is this a first sign of disintegration of another colossus?

Arthur Livingston has very well expressed in a few words the synthesis of the present situation in Italy: "The populace of Rome," he writes, "in its three thousand years of history has seen three sets of gods go tumbling from omnipotence into oblivion. It has seen emperors and republics, kingdoms, aristocracies and papacies, rise, triumph and fall. It has experimented with all the virtues and with all the vices. It has known, accepted, tested and abandoned all ideas and theories. It knows, as a result, that the world is inhabited by plain people, who, if you give them a chance, will make fools of themselves."

Can it be that history is about to repeat itself? Are we to see the sudden downfall of Benito Mussolini, together with this political fabric called Fascismo? Will the launching of external adventures, the carrying of Fascismo beyond Italian borders, stay the hand of Fate for a time? Time and Fate alone can answer.

Views of Washington Correspondents

Concluded from page 13

President Wilson was the first man to voice it; President Harding voiced it in almost the same sense and words, and both did it at the very outset of their incumbencies.

It certainly seems surprising that men like Roosevelt and Taft, both creatures of that social caste which usually thrives upon an excess of etiquette and conventionality, should have failed to note in the Presidential office an obstruction to friendship and intercourse with men. Both were very gregarious, at least as much so as Harding.

"If there is one trouble in this White House job it is in being a human being," President Harding said on the threshold of the Presidency, but fortunately, as his administration progressed, he modified his opinion. It is true, all too true, that the Presidency is the center of a veritable web of intrigue and that there are relatively very few men it is safe for the President to trust, which is a drain upon the soul and the mind.

Likewise President Harding said the Presidency was a man-killing job. That was metaphorical; it should not be taken too literally, as many critics have done. To say that he was a "martyr to the cruel system which makes the President's office a perpetual twenty-four-hour-a-day job" is not to fix cause and effect.

To repeat, it is not the official job of being President that wears down, that is poignantly oppressive, that sears the soul, that exiles, that breaks old friendships and forms strange and even grotesque unions, but it is the partisan politics attaching to the office, politics with its inexorable destiny that tramples upon feelings and intentions. It is the baleful effect of that machinery which when not started to re-elect the incumbent to office—usually on the plea of public approbation—is operated to keep the party in power. At this juncture something must give way and usually does; otherwise strong men are crushed by it.

It will not be possible under our system of government to do away with this maddening system which disturbs human equanimity, infiltrates in man's home, affects his rest and sleep—not wholly, but there is a method of relieving the strain that actually kills, the strain that is not a part of the Presidential job but that somehow cannot be dissociated from it.

A single Presidential term will help.

A single Presidential term will prevent a President, due to suspicions that he is anxious to succeed himself, becoming the more or less free and easy target of politics and politicians. It will render unnecessary the laborious transcontinental political tours during which Presidents feel that they must report on the state of their political parties to the great and inarticulate electorate.

Not that travel about the country is not useful, broadening and desirable, because it is; in fact, if a President could devise a way of spending from three to six months annually in different parts of the country it would be a great help and might tend to divide the geographical lines of political demarcation, but such visits would be good only if unaccompanied by ballyhooing and palaver.

A single term would automatically prevent a President from exposing himself before the great voting legions to see whether they will acclaim with thumbs up or stand pat with thumbs down—that constant fear that the people are not satisfied and that this dissatisfaction might mean the party's defeat. Five or six years for a term—in these days when years have been virtually contracted because of the growing intensity of government—would be sufficient to give any man a chance to set up and try his brand of administration, and the last year of office more than ample for him to give an accounting to the people of his stewardship. It would relieve him from personal strain, possible vital interest originating from vanity or pride.

It never seemed to me that President Harding was a well man because it was not reasonable that a man of his frame and build and character could undergo such a decided outward change without some accompanying alteration physically. So there is room for doubt in regard to President Harding's general condition and as to the advisability of his starting out on a voyage whose results, if translated in simple psychological manifestations as related to politics and political effect, were indeed depressing to a man who was so deeply convinced of having done his best work.

Because of that he was happy in his work. The labor involved was nothing to him. A brief review of his earlier life will amply demonstrate that the job at its worst could not possibly have affected him fatally without some other cause.

I do not believe that the epitaph that the Presidency killed him is a worthy epitaph for Warren G. Harding. He loved his job, he knew what it was and meant, and his very pride of it was a tonic.

There is nothing in the Presidency which kills. The fatal element, if it is fatal, is to be found in the politics surrounding it. The Presidency is, therefore, quite all right just as it is.

Men must die, in office or out of office.

But if work kills man then it is time to revise all our philosophy, for something would have been discovered lately that the cumulative experience of the past has disproved.

Manhattan, the Wise? World Knows It as Hick

Concluded from page 10

bottle sold to each person." But the health saver and death defier usually remains on the main street but a short time. Either the chief of police tells him to move along or the patronage does not compensate for the wear and tear on the medicine peddler's lungs. A fortnight is the limit, even in the most unsophisticated territory.

For eight months last year, Broadway, "the wisest street in the wisest city in the world," housed five of these health-restoring quackeries. They were open from morning until midnight and they were packed to suffocation all the time. The English language was murdered by the minute, medical bunk was dished out by the ton, and statements, which a three-year-old child would laugh at outside Manhattan, were received and believed in open-mouthed credulity by thousands. The identical rigmarole was gone through day after day, night after night, and at the end of the lecture, books were sold to the listeners so fast that the eye could not follow the rush of buyers. So good were the pickings for the first missionaries of the new gospel of a long life for every man, that opposition lecture rooms were opened within a space of four blocks and the crowds went from spieler to spieler and purchased book after book with an innocence that could be found solely on Manhattan's main street. The only things the inhabitants were spared by the expounders of the new science of health were the small-town displays of tapeworms in bottles and the skeleton of the man who had died because he lived too early to purchase one of the wonder-revealing volumes. The reason these "pullers-in" were absent was because they were not needed in Manhattan.

Just before the medical fakirs appeared on Broadway an enterprising showman, who knew his Manhattan, opened a museum of the type which was passé in the smallest village of these United States the night Paul Revere made his ride to fame. He filled it up with freaks and established a talented and brazen-voiced barker to announce their presence. Three dollar dramatic productions were closing nightly for want of customers but the exhibitor of the Two-Headed Boy (born and raised in Manhattan, by the way), the Missing Link, and the Man Who Barks Like a Dog packed his store show to the doors from morning to midnight. The strangest feature of the museum's stay on Broadway was that the daily papers failed to give it the attention that Manhattan's reputation for "wisdom" merited.

So hearken, all ye who have something you wish to sell with profit. If you have a scheme to collect gold from sea water, to change one dollar bills into tens without offending the government, to make eyeglasses that will look around corners, or any other absurdity, no matter how preposterous it may be, don't waste your time and efforts on the gophers of Main Street wherever they may be. Pack your grip, oil your voice, and get to Manhattan quick. For in this home of the wise there are outstretched arms and yawning pocketbooks awaiting you. Manhattan is the same today as it was in Barnum's time, only more so, and it will never be anything else.

The Greatest Medicine in the World

Just Plain, Good, Pure Water Is Recommended as Health Tonic

By CHARLES H. LERRIGO, M. D.

THE best medical advertisement I ever saw was in the August, 1914, issue of the Kansas State Board of Health Bulletin. It began with the familiar query, "Do you get up with a lame back?" and it went on to say that the best remedy for rheumatism, kidney or liver trouble was absolutely free to all—just plain, good, pure water.

Two-thirds of your body is water, and you have not a single vital function that can go on without it. It is of the highest importance that the supply be constantly renewed. Waiting for a drink until you are conscious of thirst is a mistake. The sensation of thirst does not come until the tissues are suffering, wasting from lack of moisture. You should supply the body with water at regular intervals, and if you are the average man you need to take in just about twice as much as is your custom.

Do you weigh somewhere about 165 pounds? That means 110 pounds of water in your composition. How much are you adding every 24 hours to take the place of the waste that is constantly going on? You take a certain amount of water with your food, of course, but not enough. Add to it half a gallon of water as your daily intake, under ordinary conditions of temperature. You will need more in very hot weather when you are perspiring freely.

Life depends much more on water supply than on food. You know it is possible to live for weeks without food, but the deprivation of water can be borne but a few hours. That is because every tissue of the body demands water for the performance of its functions. The blood, the lymph, the gastric juice, the fluids of brain and spinal cord all need a constant replenishment of their water supply. The delicate tissues that make up the lungs, the heart and other vital organs demand proper moisture. The mucous and serous membranes, which line the body, cover the important organs and lubricate the joints, are constantly clamoring for liquids.

Water is an essential agent in the distribution of body heat, and also the controlling factor in supplying the tissues with nourishment. They get their food by bathing in it, and without water the bathing is soon impossible. The temperature of the body would quickly lose its uniformity without proper water supply.

These facts show the absolute necessity for the consumption of a proper amount of water to maintain the body in health. But what about its use as a remedy? Is it true that water is the greatest medicine in the world?

Few doctors will dispute the assertion, thousands will endorse it. "Water internally, externally, eternally" was the watchword of one of the most famous physicians of the nineteenth century, and it is just as good today.

It is true that doctors of an older day denied water to their fever patients, but the great Sydenham broke over that custom, and for long years fever patients have been supplied with water to their hearts' desire. It is recognized that free water-drinking is a great aid in reducing temperature, because it helps clean out poisonous products of disease. Measles was the last feverish disease to get the benefit of this enlightened treatment. Many doctors clung to the idea that cold drinks were not allowable in measles for fear that they might "drive in the rash" until quite recent years. But now this prejudice has gone and patients in all manner of fevers not only get all the water they desire to drink, but also are bathed in it at frequent and regular intervals.

Water is "good medicine" in chronic complaints, too. In virtually all diseases of the kidneys the free drinking of water is a valuable adjuvant. Wealthy persons pay out large sums of money to journey to certain famous resorts. They pay high prices for hotel accommodations, and spend most of their time in taking special baths and in drinking at certain definitely prescribed periods a certain definite amount of water, the chemical composition of which varies but little from their own water at home. They get an immense amount of good from the treatment, and go back home to tell wonderful tales of the virtue of the particular "springs" at which they were relieved simultaneously of cash and indisposition. The whole of the miracle is due to the fact that, for at least a brief period, they have systematically supplied their starved tissues with a full supply of good, pure water.

Will water-drinking make fat persons fatter? There is no sound reason for this belief. On the contrary, the fat individual who drinks freely of water and then commits himself to proper and healthful exercise, will not only tend to reduce his actual weight, but will gain firmer lines and lose the sloppy figure that makes its owner so positive that no one can possibly love a fat man.

As the critical period of middle life approaches it is more than ever important that attention be given to drinking a proper amount of water. It is the age of those vague weaknesses known as "kidney troubles." So common are such disturbances at this period of life that one might well believe it true that "everybody has them." In a majority of cases these annoying and vexatious symptoms are quite unnecessary and may be prevented by a systematic effort to supply the body tissues adequately with pure water. I am not suggesting that this will be a sure cure for real kidney disease, such as may have come as a sequel to scarlet fever, diphtheria, tuberculosis or other serious complaints. But it will be helpful even to them.

Like most other good things, there are certain conditions under which water-drinking can be overdone. In cases of heart disease in which dropsy is a feature it is often wise to restrict the intake of fluids. In dilation of the stomach, water must not be taken in large quantities, although no less amount is required. Some forms of indigestion, in which the gastric juices are deficient, are aggravated by drinking water freely, especially if very cold. I would never give cold water to a patient with colic, but would pin my faith to hot water and plenty of it.

Drinking water with meals is not now disapproved as of old. A glass or two of water with a meal may even be an aid to digestion, always provided that the drink is not used to "wash down the food." For good digestion nothing can be allowed to displace thorough mastication and the proper incorporation of the food with saliva while undergoing the chewing process.

Persons troubled with flatulence and eructations of food, due to slow stomach digestion, find much relief by drinking a glass of hot water a few minutes before eating.

Is ice water safe? Yes, to the same extent as other iced drinks. If taken slowly it is perfectly harmless, because the tissues of the alimentary canal quickly convert it to body temperature. Iced drinks of any kind, gulped down hastily, are unsafe. Experience teaches that it is never wise to drink large quantities of cold water when tired and perspiring, and persons who are old and weak should not drink large amounts of cold water at any time.

But there is little likelihood of error in drinking overly much of this remarkably helpful medicine. The danger is all in the other direction. Your requirements will vary, depending somewhat on whether you are a thin, wiry person, a large, fat individual, or just the average being. I suggest eight glasses of water a day, at least one of which shall be taken before breakfast. And don't forget that it is just as important to drink water in cold weather as in hot, although it may take a little more thought to keep it in mind.

Balancing Beauty and Usefulness

Concluded from page 7

by the state college of agriculture to the development of new community centers. Plans provide as far as possible for centers every three or four miles. There the church and the school and the community hall are grouped in the most pleasing and logical manner. In many places there is a cheese factory, too, but this is not usually made the center of attraction, nor is it placed next to the church or the school. There is a common playground selected, and if this can also serve as a school playground, so much the better.

It is urged that land along a water front be kept for public enjoyment; that a proper site for a cemetery be chosen; that a community woodland for picnics and frolics be set aside. The timber sold from this woodland from time to time will pay for the upkeep of the public grounds. Eighty acres will do it for a population of from seven hundred to a thousand.

Above and beyond all, a new community is urged to make and follow a plan, with all the features clearly portrayed. Thus will the community hall be the more quickly built, or the baseball field the sooner laid out. For there is something about a plan which fires the imagination, and we "want to see the thing done" somewhere besides on paper.

The beautifying of the rural cemetery is a part which no state is leaving out of its plan for a better out-of-doors. "Civilization shows the height of its development," a wise man has said, "in the respect shown to the dead." Once seen, no one can doubt the advantage of an attractive setting of shrubs about cold stone.

There are several other new ways of balancing the beauty of the countryside with the usefulness to be gained. There's the question of trees along the roadsides, for instance. Here communities and road engineers and those who are interested in landscape design can well work together. There are those who wish to express, by means of trees, respect for the soldier dead. Shade and beauty must be brought to the highways. Fields and crops, however, must not be injured by the careless setting out of trees and shrubbery; while, on the other hand, trees rightly placed can not only be of great value to crops, but will keep the snowdrifts from blocking the way.

Business men and neighbors and students; farmers and farmers' wives and school children; home demonstration agents and community leaders; road engineers and landscape extension folks: no one of these can do it alone, but what a powerful combination for a better out-of-doors!

Abraham Lincoln as an Inventor

PERHAPS the most interesting patent model to be found among the hundreds of thousands in the United States Patent Office at Washington is the one that was made by Abraham Lincoln. It is the model of the type of boat that was in general use on the rivers of the country back in the thirties and forties of the past century.

It is claimed that this model was produced by Lincoln with the aid of a jackknife, a few discarded cigar boxes, and a shingle or two. The inscription above the model reads: "6469, Abraham Lincoln, Springfield, Illinois. Improvement in method of lifting vessels over shoals, patented May 22, 1849."

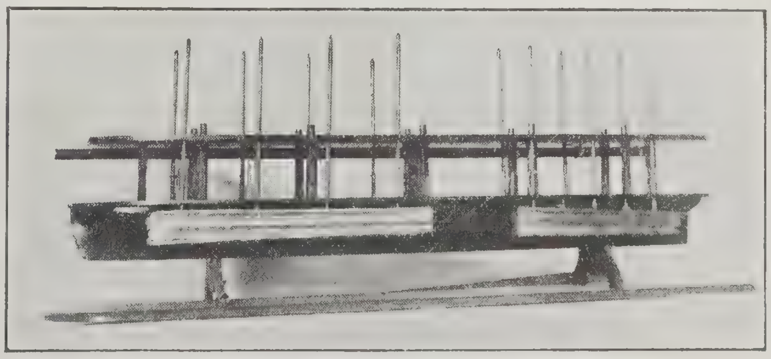
Lincoln had had considerable experience as a boatman and knew of the many vexations and delays due to boats frequently being stranded for days at a time on unseen shoals in the rivers. He conceived the idea of placing a bellows in each side of the hull of the craft, just below the water line, and working them by a system of ropes and pulleys. Whenever the bottom of the boat would strike the river bottom, everybody on board would immediately get on the job and pump air into the contrivance, thus lifting the boat free of the obstruction and permitting it to float off into deeper water.

This invention of Lincoln's was never developed to any great extent. The advent of railroads and canals and the deepening of navigable streams through the dredging process, made devices of such character unnecessary.

This 72-year-old model, however, is conclusive proof that Lincoln was a man of practical ideas, as well as being a great lawyer, politician and statesman.

In describing Lincoln's visit to his office to procure his patent, Z. C. Robbins, a prominent patent attorney of that period, said:

"Mr. Lincoln walked into my office one morning with a model of a western steamboat under his arm. After a friendly greeting he placed his model on my office table and proceeded to explain the principle embodied therein that he believed to be his own invention, and which, if new, he desired to secure by letters patent. During my former residence in St. Louis, I had made myself thoroughly familiar with everything appertaining to the construction and equipment of the flat-bottomed steamboats that were adapted to the shallow rivers of our western and southern states, and, therefore, I was able speedily to come to the conclusion that Mr. Lincoln's proposed improvement of that class of vessels was new and patentable, and I so informed him. Thereupon he instructed me to prepare the necessary drawings and papers and prosecute an application for a patent for his invention."



Abraham Lincoln's invention for lifting river boats over shoals.

BRIEFLY TOLD

A scorched corpse picked up on an oily, wreck-strewn sea was evidence of the fate of the tanker *Swiftstar*. It is believed that lightning struck the tanker amidships, disabling the wireless immediately and exploding one or two oil tanks which tore the ship apart, each half going down with all on board. Splintered wood and rudderless lifeboats with the lettering "Swiftstar" on each one were picked up between Cuba and Jamaica together with the body of the dead man.

The United States Government is able to make prohibition a success among the Indians, according to the Department of the Interior. In two years, $130,734 in fines have been collected from the nation's wards and 97,938 gallons of liquor confiscated.

Mount Washington, Oregon, was scaled August 26, 1923, for the first time on record. Six boys from Bend, Oregon, after hours of arduous work, reached the topmost pinnacle. None of the boys in the party was more than twenty-one years of age. At one time a member of the party lost his foothold and clung desperately to the face of a perpendicular cliff, with an 800-foot abyss yawning beneath him. A tube, containing their names, the story of the climb, and small personal effects, was left at the top to substantiate their claim. They slid down the dangerous part of the pinnacle by means of a rope which could not be disengaged and still remains on the peak.

The Abraham Lincoln University may become a reality if the plans of 200 business and professional men of Springfield, Illinois, carry. Effort is to be made to raise $500,000 to begin organization of the school which will be built and conducted according to the democratic ideals of the martyred President. Within a few months a committee will begin a drive to raise a permanent endowment of $5,000,000.

Heat in the Alps has been so great that glaciers have been melting and causing avalanches. Mountain streams have been blocked by these avalanches with disastrous results to factories and electrical works depending on the power of the water for their kinetic energy.

The straightest of the world's surveyed lines is that running northward between Alaska and Canada from the coast to the Arctic Ocean and constituting the boundary line between the two countries. The line consists of a clearing twenty feet wide cut through all timber, of aluminum-bronze monuments set at intervisible points not more than four miles apart, and of a map in detail of the strip of country two miles each side of the boundary proper. In 1867, the American and British treaty makers laid a ruler on a map and said, "This shall be the dividing line." The line traverses 600 miles of country over great mountain ranges, swift rivers, quicksands, glaciers and bottomless morasses.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A new national park in the Big Horn Mountains, in Northern Wyoming and Southern Montana, is about to be created if plans carry. The park will be in the shape of a triangle, with one point across the mountain line and the other side going east from Bald Mountain and north along a line that would include part of the Crow Indian Reservation and the famous peaks of Sheep Mountain and Medicine Peak.

A blue jay was killed by a golf ball driven from the eighteenth tee on the club links at Hempstead, New York, recently. The president of the golf club was playing in a foursome and was the first to drive off. As he struck the ball the bird flew from a tree near by, and ball and bird fell together close to the tee.

A fourteen-story hotel for Negroes will be built this autumn at Atlantic City. The building is to be owned, operated and patronized exclusively by Negroes. It will be of steel and reinforced concrete, and will require an estimated expenditure of $750,000.

The Chinese game, Mah Jongg, which has taken America by storm and which is being played in London, Paris and other world centers, was invented 3,000 years ago by a Chinese fisherman who whiled away the time during storms playing the game with his employes.

Cornelia James Cannon, writing in the *North American Review,* says: "The presence in recent years of large numbers of Jews, especially of those from Eastern Europe, where the Jew is essentially an Oriental, in our big centers of population, has been accompanied by a development of racial prejudice which is as unfortunate for the country as it is tragic for the Jews themselves. Those Jews who are already here, who have been admitted to this country and thereby made free of its rights and privileges, must be given every welcome, protection and encouragement. But for their sakes, as well as for the sake of a harmonious nation, we could to advantage practice a rigid limitation of that race in the ranks of immigrants."

A Titian *Madonna and Child,* Raphael's *Crucifixion,* and paintings by Fra Bartolommeo, Gentile Bellini, Palma (Il Vecchio), Correggio, and Tintoretto were bequeathed to the National Gallery, London, in the collection of the late Dr. Ludwig Mond. The Raphael was painted when the artist was sixteen years of age, and is worth $250,000.

Wages of plasterers who receive $104 and more a week are causing ministers and members of other professions to take up the trowel in Evanston, Illinois, where work on a new hotel is in progress. Graduates of universities holding several degrees turn down offers of professorships to join the plasterers. Other graduates who stick to their chosen professions receive but $200 a month while the plasterers receive between $400 and $500 monthly.

The powerful voice of Senator-elect Magnus Johnson can be heard a long distance. When the committee on rules assigned him to suite 125 in the Senate Office Building they had this in mind. The partitions between the rooms are very thin and any loud expression can be heard in rooms adjoining. The question was solved by arranging for a "buffer room" between his suite and those adjoining—that is to say, extra rooms were added to the adjoining suites which may or may not be used.

Amy A. Kaukonen, mayor of Fairport, Ohio, resigned recently after a bitter fight of nineteen months with bootleggers. She clamped the lid on and beat the bootleggers to a finish and then resigned. At a mass meeting of citizens her administration was declared to be the best in years, and all her predecessors were men.

Good paper can be made from banana refuse. The trash or refuse, consisting of the stems of banana trees from which the fruit has been cut, is run through crushing rolls, which produces a mash in which the moisture has been reduced from 90 to 55-75 per cent. A pulping machine reduces the mixture to pulp and the pulp and juice are boiled and beaten. The removal of the fibrous material from the beater completes the process, in which no chemical is used.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

CHRONICLER OF THE NEGLECTED TRUTH

Tobacco's Money Toll Two Billions Annually

Rise of Cigaret Marks Most Extended Growth Having Increased More Than 2,000 Per Cent in Last Twenty Years

By ROBERT KENTON

TWO billions of dollars a year for tobacco! And this doesn't include the indirect cost, via soil depletion, drain on efficiency, ill health, shortened lives.

Booze at its pre-Volstead worst took a direct toll from national economy of only a little more than a billion and a half dollars. And John Barleycorn's indirect levies, so gross in form that they were easily visualized, were less, say some students of the subject, than are Lady Nicotine's more subtly taken indirect tribute today.

For the tobacco-using habit has grown in America during recent years as never before since Sir Walter Raleigh introduced it to the civilized world. Most forms of its use have increased rapidly, but the rise of the cigaret marks the most extended growth in tobacco consumption in this country. In the last twenty years cigaret smoking among us has increased by more than 2,000 per cent.

The economics of the tobacco-using habit have received very little attention from students and commentators of the subject. As with alcohol, until the light of economic truth emblazoned the roadway to national prohibition, the use of tobacco has been treated more or less emotionally by both its friends and its critics. King James I, tobacco's first strong opponent, denounced it in virulent but only rhetorical terms. So did others who in the early days tried to prevent its spread. They decried it as filthy, unbecoming, un-Christian rather than as costly.

Scientists in Inquiry

TOBACCO'S defenders have employed in even greater extent emotional resources. Poets have praised the pipe in immortal verse which after all is much more beautiful than logical.

Only within the last few years have attempts been made to subject tobacco to the cold and impartial test of scientific scrutiny. These so far have been fragmentary but in many cases thorough. It is notable that the verdict rendered by virtually every one of them is against tobacco.

A committee is now pursuing an inclusive investigation of the subject. It is made up of scientists and authoritative thinkers who have pledged themselves to present all the facts as they are discovered. The work of the committee probably will run through many years.

The committee has not yet gone into the economic phases of the subject. But on these phases there are available considerable and in some respects startling data.

The economics of tobacco begin, of course, on the farms devoted to its culture. In America, tobacco is now produced on nearly a half-million farms. In 1919 almost 2,000,000 acres of land was employed in its culture in this country—in great part the best land we have, for on no other kind is tobacco culture usually profitable. Tobacco depletes the soil probably more ferociously than any other farm plant. Once rich farming areas—Southern Maryland, for example—have been made poor by the continued cultivation of tobacco. This factor in the national cost of tobacco is too elusive for even approximation.

In 1894 American farms produced only 360,000,000 pounds of tobacco leaf. In 1914 the production was 1,034,000,000 pounds; in 1920, 1,508,000,000 pounds—an increase in twenty years of 319 per cent.

Of course, we export considerable tobacco and tobacco products, much more even than we import; but the bulk of the tobacco grown in this country is consumed here.

2,000,000 Live on Tobacco

THE approximately 1,000,000 persons whose time is given to cultivating tobacco on the farms are only about one-half the number of all the persons in the country who are engaged in seeing that our pipes are filled, our cigarets rolled, and our cigars and plugs made of easy access in more than 10,000 stores devoted exclusively to the sale of tobacco products.

In 1921 almost 150,000 persons were engaged solely in the manufacturing of cigars and cigarets alone, their salaries and wages aggregating $129,000,000. The number was smaller than in 1919 or 1914 when prior censuses were taken. This is due, no doubt, to increasing use of machinery, for the wholesale price value of the output of these workers' toil rose from $314,884 000 in 1914 to $806,749,000 in 1921. This in turn was due in some measure to a heightened level of values; but, as will be shown, it is owing in great part to extraordinary spread of the use of tobacco among the people of this country. When you add to the figures above the profits of retailers, you will find that we are now spending nearly one and a half billion dollars a year for cigars and cigarets alone.

They are the chief forms of tobacco use in this country, but older forms hold on and as a whole grow with tenacity that is astonishing.

Only one form, insofar as the writer's researches show, has ever passed out—or even receded. It is the ancient classical one of sniffing snuff, that is, of inhaling powdered tobacco through the nostrils. Snuffboxes still adorn the desks of United States Senators, but the practice of sniffing pinches of the stuff long ago became obsolete.

But we are consuming more snuff than ever before. Last year, for example, it took nearly 40,000,000 pounds of it to satisfy our craving for tobacco in that form. The consumption of snuff has increased by 7,000,000 pounds in the last ten years. The humble folk who use it now pay $7,000,000 a year in taxes for the privilege of "dipping."

The plug holds on but not so well as the snuffbox; there has been a slight decline in the use of chewing and smoking tobacco. These kinds are so interchangeable that no statistical line can be drawn between them; all the decline probably has been in the realm of the "chew" which has become less fashionable than it was of yore. However, of both smoking and chewing tobacco we now consume, plus exports, about 400,000,000 pounds a year, or approximately four pounds for every man, woman and child in the country.

The consumption of cigars has just about held its own during the last ten years. Of them we now consume approximately 10,000,000,000 a year.

Cigars probably have given way slightly to cigarets, which appear, however, to have hewn out a new but extensive field for tobacco in this country.

The older forms of tobacco use—especially those expectorative ones which so roiled Mrs. Trollope and Charles Dickens—have been with us since the Indians acquainted our ancestors with the "weed."

But of cigarets we knew nothing until they were introduced into this country by foreign visitors to the Centennial Exposition at Philadelphia in 1876. No habit ever progressed over such protest as that made in America for a half-century against the "fag." The onslaughts of its opponents exceeded in zeal and virulence the pronunciamentos of kings and popes against tobacco in the seventeenth century.

Yet the cigaret went ahead steadily and startlingly. Twenty years ago, however, we managed to get along with 2 000,000,000 ready-made cigarets a year. Today we are consuming between fifty and sixty billion factory-rolled cigarets in addition to many billions of the "roll-your-own" variety. Since 1914 the smoking of cigarets has quadrupled in volume, consumption increasing at the rate of about ten billions a year.

Every year now in America there are smoked from 500 to 600 ready-made cigarets for every man, woman and child in the country.

How much of this is due to the adoption of the habit by large numbers of girls and women is a matter purely of speculation; no doubt, however, it is considerable.

Cost of Cigaret Stubs

IT IS impossible to estimate the volume of "roll-your-own" variety of cigaret smoking that is done in this country. Books of cigaret papers containing not more than twenty-five sheets are not taxed; hence there are no statistics on production. Yet enough of the other kind were made and sold last year to yield more than $1,000,000 in Federal taxes, though most of the taxable cigaret papers used in this country are imported.

The money cost of the nation's cigarets, and all tobacco, too, is well illustrated by a comparison drawn in a speech made in Tennessee a year or two ago by Dr. P. P. Claxton, then chief of the United States Bureau of Education.

"Cigaret stubs in the United States last year," he said, "cost the smokers more than was spent for teachers' salaries in all grades of schools and universities. The entire country spent three-fifths as much for education as for tobacco, and Tennessee spent one-fifth as much for education as for tobacco."

Our tobacco bill now exceeds the value of all the metals taken from our mines; it is twice the present farm-price value of the wheat crop, almost equals that of the corn crop, and is about the same as the value of all the cotton grown in the country.

But that is the direct toll. Only some parts of the indirect cost of tobacco are reducible to figures. One of these is fires caused by smokers.

According to authoritative figures there were destroyed between 1917 and 1921 by fires originated by careless smokers dwelling houses having a total value of $15,824,598.

According to persons who collect national statistics on the subject, careless smokers cause the destruction by fire of more than $165,000 worth of property a week, giving origin to 6.6 per cent of all fires occurring in the country. Among them have been some of the most distressing fire disasters, such as the one occurring a few years ago in Binghampton, New York, in which sixty-two women and girls were burned to death and fifty others seriously injured.

The fire cause rated as "Matches-Smoking" now leads all others used in statistics dealing with the subject.

Tobacco's greatest indirect economic toll, however, is in the reduction of human efficiency caused by its use. This opens up the age-old question of whether with the average person tobacco's harmful effects are offset in any way by helpful contributions.

In the main this phase of the question has been dealt with chiefly by emotional and rhetorical processes.

Professors of many of the world's most capable minds and hands have been inveterate users of tobacco, and some of them have defended it stoutly. But they have defended it generally only from the safe emotional background that poets and other imaginative writers have adumbrated peans of praise for both nicotine and alcohol—from the same wordy background from which both nicotine and alcohol usually have been attacked as well.

However, within recent years several laboratory experiments have thrown considerable scientific light on the subject. And virtually all the evidence thus evolved, it must be admitted, weighs against the use of tobacco in any form.

In its issue of May, 1914, the *Efficiency Magazine* published the following:

"As a result of a series of experiments by Dr. A. D. Bush it has been ascertained that tobacco smoking causes a decrease of 10.5 per cent in mental efficiency. There was a series of 120 tests on each of fifteen men in several different psychic fields. The men who volunteered for the tests were all medical students ranging in age from twenty-one to thirty-two years, of varying previous experience, from the farm laborer to the life-long student. The subjects were attendants at the University of Vermont, where Dr. Bush is an instructor in physiology."

Tobacco Makes for Inaccuracy

ELABORATE tests made more recently by Dr. George Fisher and Elmer Berry at the Y. M. C. A. College in Springfield, Massachusetts, yielded similar results. These tests had to do in the main with acts of precision. Young men athletically trained were used in the experiments. The feats they were subjected to were such as throwing handballs or shooting at targets.

In the case of old smokers it was found that a loss of accuracy averaging eleven per cent followed the smoking of only one cigar. In the case of non-smokers one cigar caused a loss of thirteen per cent, and two cigars a loss of eighteen per cent.

These and other experiments lead some commentators to estimate the loss in working efficiency in the United States occasioned by the use of tobacco at from twenty to thirty million hours of working time a day.

It is probable that more than one-half of all the 40,000,000 "gainfully employed" persons in the country use tobacco daily in some form. Estimating reduced efficiency thus caused at no more than the equivalent of one hour's work a day for each person, it follows that the economic loss thus resulting cannot be less than an aggregate of 20,000,000 hours a day—equal to the full working time of 2,500,000 persons!

Is there any offsetting economic return? The most thorough students of the subject say no, for they maintain that of all the nineteen different chemical substances yielded by tobacco in its various forms of use, none is of a kind that is primarily beneficial to the normal human being.

These substances include several very deadly poisons, such as nicotine, carbon monoxide, furfurol.

Of nicotine, Dr. John Harvey Kellogg, of the famous Battle Creek Sanitarium, estimates there is in the aggregate of tobacco consumed annually in this country from twenty to thirty million pounds. And nicotine has "death dealing properties second only to prussic acid, the deadliest of drugs."

Furfurol—Worse Than Alcohol

THE pipe smoker, says the same authority, gets more of it than does the cigar smoker who in turn gets more nicotine than the cigaret smoker. However, the cigaret smoker, says Dr. Kellogg, imbibes a larger volume of furfurol, which is "fifty times more toxic than alcohol."

What the injection into the systems of millions of human beings in this country of immense volumes of potent poisons yielded by the pipe, the cigar, the cigaret, the chew, the snuffbox does by way of contributing to invalidism and shortened life is a phase of the subject on which there are no statistics. Some students, however, are of the opinion that the aggregate of harm thus done is greater than that ever done by alcohol—even though smoking doesn't cause men to beat their wives or go on Saturday night jamborees that land them in jail.

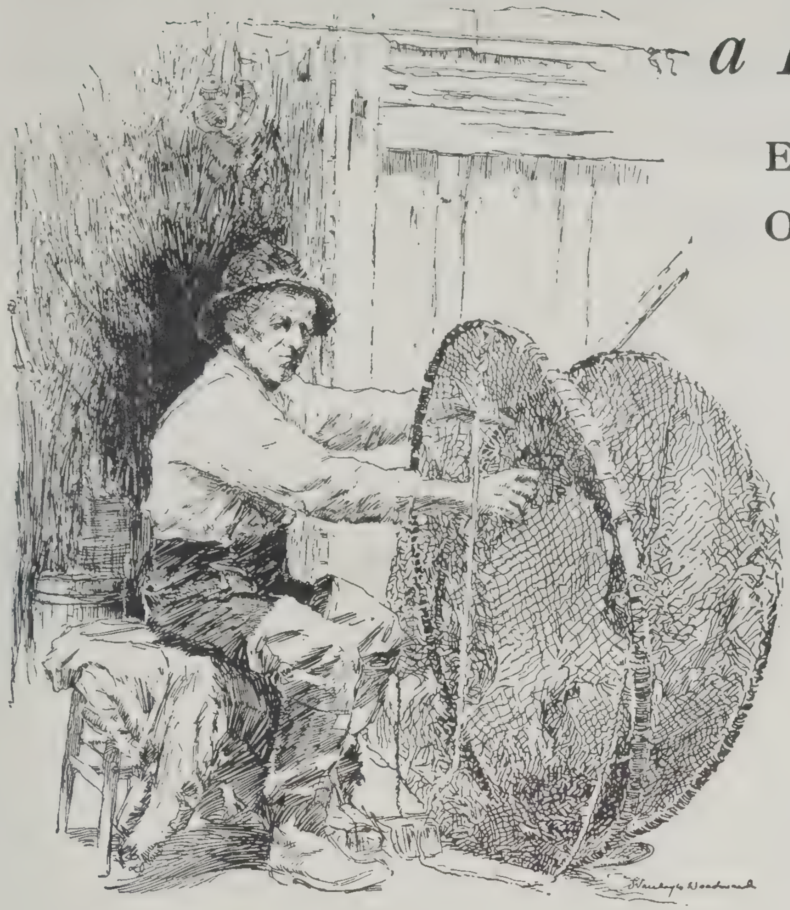
However, there are authenticated cases of drunkenness and even of delirium tremens that were produced by tobacco, which, as everyone knows, is at least a contributing cause frequently in cases of such serious diseases as Bright's Disease and of cancer.

Thus, summing up the economic phase of tobacco and considering all the factors, it is well within the bounds of conservatism to conclude that the economic cost of the use of tobacco in this country is considerably more than three billion dollars a year.

The Honest, Care-free Folk of Casco Isles Are a Pure South Saxon People

Every Dot of the Commonly Reputed 365 Off Maine Coast Has Its Own Traditions

By MAY B. WHITING



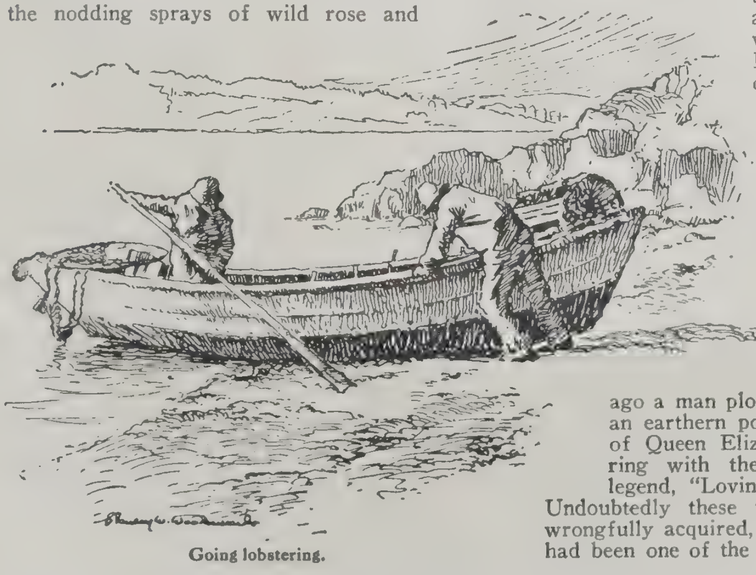
Mending a net.

THERE is something fascinating about an island. Robinson Crusoe could never have so charmed us with his adventures if they had befallen him on the mainland, nor would the name of Napoleon have kept all its glamour if he had not been island born. "Isles of the Blest" was the ancients' ideal of heaven, and anyone who has known Casco Bay, studded with myriad islands, each a gem of beauty, can well appreciate the fancy.

From Cape Elizabeth, the southerly headland of Portland Harbor, Maine, "down east" for twenty-five miles they stretch, in almost perfect alignment, making the landlocked waters of the bay ideal for pleasure navigation. On every side they rise, topped with spruce and hemlock, while gray cliffs descend to the water's edge, interspersed with reaches of pure white sand, snug coves, and pit holes for buried treasure. Only a few are barren and treeless, and these, the farthest seaward, serve as nesting places for the gulls. In spring and early summer the rocks are covered with their eggs, and always, at the approach of a boat, clouds of birds arise with whirring of gray and snowy wings.

The exact number of islands seems to be a mystery. In 1770, a prospector wrote to His Majesty that "ye Bay is cover'd from storms that come in from ye sea there being (if one may believe report) as many islands as there are Days in a yr." Every writer since has strengthened that report, and 365 is the number commonly quoted. To one sailing down among them the view is always shifting, often with a mirage that is almost startling. One never knows just what is around the lee of the next island, perhaps a herd of seals basking on the rocks of a secluded shore, perhaps a bell buoy with its lonely warning, or a racing yacht that glides across your bow like a phantom. And every island beckons with its fir trees and coaxes with the nodding sprays of wild rose and sweetbriar overhanging the rocks for you to explore its beauty.

And there is not one that is not well worth knowing. Each is a little world by itself with tangles of wild flowers, dark woods which one could fancy were the deep primeval forest but for the surge of ocean in his ears, the air sweet with balsam and bayberry, and songs of redstarts songsparrows, finches, mingled with the shrill cry of mackerel gulls fishing in the coves Most of the islands have only one road many of them none, although there are numberless paths. The islander has little need of a road. His cottage is perched on the edge of the rocks and the broad sea is his highway.



Going lobstering.

These islands were settled before the mainland, for, even in pioneer days, the prospector could not resist their charm. And they have been singularly free from immigration, so that probably not even in Sussex itself is there so pure a strain of South Saxon blood. The speech of the islanders, unlearned as it may be, retains a purity of expression and a sweetness of tone very unusual in our country. They are single-hearted, honest folk, spotless in their homes, keeping their Sabbath faithfully from sundown to sundown, going about their duties in a manner that seems, to the summer visitor, idyllically unhurried and free from care.

Yet the islander does not spend his days doing nothing. When the fishing season is on he starts out by two or three in the morning for the fishing grounds by the farthest seaward islands, fishes until midday, then carries his catch to Portland. If the day promises to be foul he repairs his nets and lobster pots and swaps yarns with his neighbors. In the winter he may lay by his boat and go on a larger vessel, or more likely keep to his trade, making a channel when the bay is lightly frozen over and watching his chance that the ice floes do not crush him.

Every island, like a feudal domain, has its own history and legends. There are four at the entrance to Portland Harbor and on one of them Christopher Levett, in 1623, built the first house. The name House Island, where the quarantine station now is located, indicates that it was the chosen site and we read that in 1661 there was an *old* house upon it. But before that date parties of traders sailed up and down the Bay, searching for sassafras and securing furs from the Indians who brought gifts of wild grapes, corn, and venison.

In 1628 one Richard Bagnall "squatted" on Richmond Island to trade with the Indians, and he so unmercifully cheated them that they murdered him. About fifty years ago a man plowing on the island turned up an earthern pot of gold coins of the time of Queen Elizabeth and a signet wedding ring with the initials "G. V." and the legend, "Loving hearts death only partes." Undoubtedly these were the property, perhaps wrongfully acquired, of that "wicked fellow" who had been one of the lawless crew at Merrymount and whose death the governor of Massachusetts was in no hurry to avenge. The men he finally did send hanged without question a sagamore, Black Will of Nahant, who happened to be on the island but who had nothing to do with the affair.

With such stupid and iniquitous acts on the part of the settlers, it is no wonder that the friendliness of the Indians turned to bitter hatred. On Cushing's Island, which forms one side of the entrance to the harbor, there remains a rough breastwork of stone thrown up by Parson Burroughs who, in 1676, transported a party of women and children there to save them from massacre. There is also a pool made by throwing out beach stones through which the tide ebbs and flows and where these unfortunates kept their fish and lobster alive against foul weather. It was on Cushing's, too, that John Josselyn, that most delightful of historians, saw the original sea serpent "quoiled up like a cable," and would have shot him had not the Indian guide feared that the serpent would upset the canoe in his death throes. White Head, a sheer cliff of 150 feet, on the ocean side is probably the most picturesque rock on the Maine coast.

Next down the Bay from Cushing's is Peaks, the most populous of the islands, and the only one which is an "amusement place" as the lovers of Coney Island use the phrase. Near Peaks is a beautiful little wooded island, Pumpkin Knob. There has been some talk of removing it by the T. N. T. process, that the government might gain a passage to the sea, but it is likely that it will remain on the foundations nature set for it.

The "Pearl of Orr's Island" house.

Across from Peaks are the two Diamonds, Little and Great, with their forts and lighthouse tending station. These islands are named from the beautiful white quartz crystals found on them, as on Jewell, farther down the Bay, iron pyrites which gleam like gold abound. On Bustins was the mine the lead from which the impostor Ranson, a hundred years ago, claimed he could transmute to gold.

Jewell is one of the most interesting of the islands. During the French and Indian wars bloody fights occurred there, while its numerous coves made it the favorite resort of smugglers, and, according to report, of pirates. The story is still told of how a party of Bermuda pirates foundered off Brown Cow, and part of them escaped from the wreck and got to Jewell with the booty. Some years after, Chase, who was then the only inhabitant of the island, saw two strangers land at dusk with shovels. The next morning they had gone, and certain stones with mysterious

"Impending Ruin" a Myth

THANKS to the *Saturday Evening Post* for its article "Dwindling Disasters" by Robert Crozier Long, in the issue of September 15. For so long a time have we been compelled to read and hear false predictions of ruin and disaster, and threats that the destruction of Europe would fall guiltily upon the head of America, and weird visions of the next war sweeping the earth bare; for so long has it seemed almost useless to protest against the utter falsity of that whole point of view, that it is a relief to observe the idea making its way that the whole propaganda of disaster has been a calculated play upon the fears and emotions of the world.

After the falsehoods that have been told the people—falsehoods for military purposes, falsehoods for peace purposes, falsehoods for charitable purposes, falsehoods for political purposes—it will be a wonder if the people are ever again induced to believe the utterances of their leaders.

"The myth of impending ruin," says the article in the *Saturday Evening Post.* "Stark, staring ruin has stood long on the program, and truth might be allowed to show its nose . . . . *The truth being that Europe is not ruined at all."*

Even the Money Bogey is ruined. We who remember the days when the most exalted prophet of the Administration waited breathless for the collapse of Germany on account of the depreciation of the mark, and we who said then that it was possible for a country to be *financially bankrupt* so far as "international finance" was concerned and yet remain *economically sound*—we appreciate the courage of the *Post* in giving currency to the fact that "money could go one way and production and trade another."

"The myth of impending ruin" has failed of its purpose in America. Flattery and cursing have both proved unavailing to move us. At first the international bankers tried it, flattering us that we were the richest country in the world and could therefore save the world. That myth has been exploded by *the fact that the greater part of the gold in America is owned in those very countries which we are called upon to save.* Then came the idealist crowd, the literary lights and the clergymen and clergywomen, in an effort to shame us into doing what the international bankers wanted, telling us that it was our selfishness and cold-heartedness and cowardice that were ruining the world. That bubble has burst also. "The myth of impending ruin" has been shown to be a myth, and the thing worth knowing is that the American people sensed it to be a myth before anyone had the courage to stand up against the prevailing tide and prove it to be a myth.

England's Laureate in Michigan

AN AMERICAN university president, Burton of Michigan, goes abroad and returns with the Poet Laureate of England—or, what is practically the same, the Poet Laureate's promise to come. This must be reckoned as the academic touchdown of the year. Poets Laureate have been such exalted creatures, closed in by classic shades, the voice of Britain in gloom or glory, that apparently no one ever thought of bringing one of them to America, let alone inducing one to accept a fellowship at an inland town in Michigan. It is like bringing the Lama of Thibet to the county fair! Seriously, has ever a Poet Laureate visited America before? Memory at the instant does not recall one who did.

For the past two years the University of Michigan has been enabled by a private donor to offer a creative artist a term of residence without duties for the sake of the atmosphere that his presence might be able to create. For two years this fellowship has been held by Robert Frost, probably the most distinctive living American poet. Mr. Frost did more than his invitation called for, gave himself freely to all young ambitious minds, made frequent public appearances, and departed. To succeed a Poet Laureate in such a post would be honor enough for any mortal, but to be succeeded by the Poet Laureate of England!. . . .!

Robert Bridges is eighty years old and has been anything but a toady in his office. He has dignity of person and mind and is a workman in letters who needeth not to be ashamed. Most pleasant of all, next to Mr. Bridges' consent to come, is President Burton's intimation that the change from Oxford to Ann Arbor will not be too great for the Laureate, since, as President Burton stoutly declares, there is as much "atmosphere" to be found at an American university as at European shrines of learning.

A Tactical Error

"WET" propaganda, always stupid, has made another error. It has lined up the openly "wet" and the secretly "wet" newspapers in one grand flourish of exposure of "prohibition conditions." To save themselves from the attack of the church and the "dry" forces these papers protested that they were doing it for the good of prohibition! —which explanation proved suitable for a little while, until the public perceived that these newspapers protested far too much. And now the game is up. So many clergymen, however, are stiff with fear when it comes to criticising specific newspapers in their own city, that the reaction is not what it ought to be. The result, when computed, will be that the secret journalistic enemies of prohibition have been uncovered—have, indeed, uncovered themselves.

Giving a False Report

WE ARE no more disposed to receive the reports which American clergymen make of conditions in Europe than we are to recommend that Europeans should receive clerical reports of conditions as they are in the United States. The present opinion of the clergy concerning certain international matters is the result of intensive propaganda and not of knowledge. The cry that has been so repeatedly raised that not Europe only but civilization itself is in actual process of destruction because of America's refusal to enter the League of Nations, would be a most moving one if true, and the clergy have accepted it as being true when it is not true at all. Any observant clergyman must feel that all the regimented preaching on the theme has had no effect. Truth is never uttered with so little effect. It becomes timely then to inquire what is the explanation. It may be this—Claque propaganda of any sort is too easily detected by the people.

When a Boston clergyman goes up and down England assuring the British people that "the *people* of the United States feel keenly their deprivation in not being able to align themselves in an organized capacity with other nations through the League," he does two things: he wholly misrepresents the attitude of the people of the United States, and by italicizing *people* he but adapts war propaganda methods to indicate a difference between the people and their government. The implication may be, and the inference certainly is, that the American *people* are straining to get into the League but the American Government won't let them. One doesn't have to be a statesman nor even a clergyman to know that that is not true.

It is not true even of the rank and file of church membership. It is only true of a class which has formed its opinions on false propaganda.

What a pity that the facts of our people's reluctance, their psychic caution, the silence and equal caution of the Europeans that have come among us, have not been received nor measured. Is it not a noteworthy element of the situation, this attitude of the people? Only by a misrepresentation of this attitude, a complete ignoring of the possible instruction to be found in it, can such messages be given abroad as that one referred to above.

The Folly of "Welfare Work"

PROFESSIONAL "welfare work" is gradually being unveiled for what it is. Little more than a fad and an impertinence at any time, it was primarily adopted to assuage the twinges of capitalistic conscience. During the steel strike competent observers were surprised to discover that part of the resentment leading to that breach was due to the very "welfare work" which the steel trust was exhibiting to the world as proof of its tender interest in its employes. There was no doubt that the hundreds of thousands of dollars, yes, the millions of dollars claimed, had really been spent on the welfare program. No doubt of it. The figures were there and the devices themselves were there. But the devices were adjuncts of the steel mills. The swimming pools were part of the steel mills. So were the libraries and dancing pavilions and parks and party parlors. The "enjoyment" of the employes was regimented just as their work was. Their laughs were paid for, just as their labor was paid for. The company spent the money, no doubt of that—but the employes didn't. "Ingratitude," of course, was the company's verdict. And it is pitiable, too, more pitiable than censurable, because it indicates how little the leaders of men realize that the men led are just human beings like themselves.

The latest failure of "welfare work" is Lord Leverhulme's in the north of Scotland. That work was press-agented around the world as a sort of localized millennium come to earth. But just as the denizens of Pullman's model town turned and rended Pullman, so did the recipients of Lord Leverhulme's bounty grow tired, with the result that the nobleman has given it up and will continue to make soap unmixed with patronizing welfare. He has handed the welfare devices over to his employes and bid them look after their own welfare.

The difficulty has been that seldom does a great employer who has been bitten by the bug of "welfare work" seek to learn anything from it. Usually he sits and glows in the adulation of half-baked idealists who help him to believe that he has already produced one segment of the kingdom of heaven. His conscience is soothed. His responsibility to his fellow men is finally settled. He is through. Like "community chest charity," it is a mere matter of signing checks and hiring social tinkers who can make nice speeches on "The Problem of Poverty." It is only an extension of the old philanthropy which thought its duty done when it gave a beggar a shilling and its employes a turkey at Christmas.

It has come at last to this: there is no welfare work that can serve as a substitute for fair wages. To provide ornate "company" swimming pools for employes whose wages do not enable them to provide a bathtub at home; to build recreation centers for employes who have not enough surplus to enable them to choose their own recreations, should be recognized as pure folly and contrary to the commonest instincts of self-respect.

This is said, not in criticism of what has been done (the only criticism could be of the failure to learn anything from what has been done) but to forewarn those communities that are waking to the necessity of doing something to "prevent labor trouble." Let such communities know that the ice cream sociable method is a ghastly failure and leaves more wounded self-respect in its trail than genuine hard-fisted indifference does. Workmen know a miser for a miser, but the employer who would cloak the wage deficiency with "welfare work," they come speedily to judge as a hypocrite. It is the old principle that men can endure justice but charity galls them.

As a stabilizer of relations between employer and employe the *just wage* has no substitute. Where you see all the social and cultural institutions of a community under the patronage of "the company" you may be sure it is an impoverished underpaid community and that the company's dividends are swelled by money that should be in the pay envelopes.

It is of no use to blame the unions nor the ingratitude of men until the *just wage* has been paid, and when this is done there is little more heard of the unions or "the class war."

A normal community is where the people do for themselves—build their own schools and churches, devise their own recreations, select their own diversions, direct their own leisure. And where these things flourish independently of "the company" you may be sure it is due to wages paid and not to charity.

Mr. Ford's Page

THERE are two attitudes to be taken toward the times, and only two: the attitude of interpretation, and the attitude of challenge. These are at the base of all the divisions that exist between people of the same community and generation. Other explanations of our divisions are artificial. There are all sorts of explanations, such as difference in wealth, or education, but close analysis will discover that the fundamental "class difference" is psychic, a matter of mental attitude.

Conservatives and radicals are born, not made. Multitudes of people pass from one side to the other in the course of a lifetime. If all the radicals had remained radical, social systems would be non-existent; and if all the conservatives had remained conservative, our record of progress would have been less impressive.

Take the "classes," as they are commonly defined. They are supposed to be divided on the score of wealth—the people of large possessions in one class and the people of less possessions in another. The former are supposed to be the conservatives, the foes of progress and social fairness; the latter are supposed to be the radicals, the progressives, the reformers, the foes of injustice and mere financial power. But this is a classification founded on the desire of would-be leaders who would wrap human society in convenient parcels; it is not founded upon the fact. For if there is anything which acquaintance among men teaches it is that wealth as often releases the mind to radicalism as lack of wealth releases it to conservatism.

> *FEW people live in their own times. They live in some imagined romantic past which was just as common and matter-of-fact as the present is, or in some imagined millennial future which when it arrives will be just as common as today. Their attitude toward their own times is one of indifference or challenge. Yet today is the past brought up to date; today is the threshold of the future. If you can interpret today you have a finer view into tomorrow than the visionary who cannot see today for tomorrow's castles in the air. People are mentally suffering, are needlessly lacerating themselves, because they have assumed that Today means nothing and cannot be interpreted. Yet if today has no meaning, the past was a Blank and the future is a Chaos. But today has a meaning, all the meaning that there is; it is the root, the chrysalis of all that is to come.*

Look at the "money question," for example. Anyone would think, indeed the public has been taught to think, that the "conservatives" are to be found among financiers. If any "class" was to be trusted to act with the utmost caution it would be that class whose business *is* money. And, on the other hand, if any "class" was to be expected to act with utter recklessness in the matter of finance it would be the working class to whom the mysteries of money were unknown. The financial notions of the "masses" are always to be distrusted! These are reasonable deductions from the current descriptions of the two "classes."

To measure how far these opinions fall short of the mark it need only be recalled that the only recklessness which has ever plunged the country into financial disaster has been the work of the financiers, the wise men of money, from the time when the United States Bank of President Jackson's time "disciplined" the people, to the recent time when the Federal Reserve officials deliberately "deflated" the people. The entire series of panics which blot the history of this nation is to be credited exclusively to the so-called "conservative" class. But, on the other hand, the people, "the radical classes," "the uninformed classes," "the mob," has in every crisis been on the side of "sound money." In this most important matter we see a total reversal of the common notion—the so-called conservatives behaving with the utmost recklessness, and the so-called radicals behaving with uncommonly good judgment.

So apparent was this during the last panic that the so-called conservative class endeavored to transfer the blame to the people. The people were "extravagant," we were told. The people were "squandering" their wages. But had it not been for the normal expenditures of the people the panic would have been much worse than it was. The people spent money to keep business afloat. The "conservative" class, so-called, did not spend money, rather they made money more and more impossible. It would be a difficult task, therefore, to convict the people of "radicalism" with regard to that most important question of money.

No, the difference is deeper. It is a matter of looking at one's own times from the angle of the interpreter or from the angle of the challenger. This is decided by one's temperament and experience. Some begin with the temperamental assumption that the times are all right, the world is all right, everything is all right. As they gain experience they find a world which modifies their conceptions. Others are born natural rebels. The world is all wrong, and everything in it must be changed, overthrown, righted. Many of these, as they gain experience, come to feel that conditions are about as good as they can be, considering the elements out of which the conditions are made.

The difference is, not that one class says the world is good and the other says it is bad, but that one interprets the world as being just about as decent as it can be considering its material, and the other confronts it with the taunt that it is wholly wrong.

Neither class receives much satisfaction. There are individual exceptions, of course—fanatical defenders of things as they are, fanatical revolutionaries against things as they are; and only the fanatic can be happy in extremes, his happiness being the compensation of his deficiencies. For the most part, people fluctuate between the two, in youth veering toward the challenge, and for the rest of their lives being alternately interpreter and denouncer.

Both views are right and the explanation of "normalcy" as denoting the attitude of the majority while "extremism" denotes the minority, is that the majority of people move between both views. War is the only thing you can have when the material for war is all you have. Panics are the only things you can have when the material for panics is all you have. People will be deceived, misled, robbed of their savings, made the tools of quacks and charlatans in politics, finance and religion, as long as the people themselves present the opportunity for deception. And how shall they be saved? By being sheltered from their foes, or by learning from hard experience?

It is thus that the interpretative attitude reasons. Things are bad, but will expostulation make them better? Will mass meetings and resolutions make them better? Will idealistic oratory make them better? Or will a grinding course of experience with the facts produce the change which all social-minded men desire?

The interpretative attitude has the advantage of dealing with facts as they are. It saves itself useless laceration by reflecting that nothing else is possible, conditions being what they are. And it justifies itself from the criticism that this is a heartless view, by pointing out that the surest way *out of* the present confusion is simply *through it.*

As a clear matter of fact, most of the people who adopt the challenging attitude toward conditions are only the precocious graduates of the interpretative attitude—they are only a little earlier than the others. The vast public is made to suffer and suffer again, and again, until at last the source of the suffering is made clear, and a few alert souls move to abolish the source, never dreaming of anything save that the public will follow their lead and end the suffering. But no! the vast public doesn't follow, it isn't finished with the interpretative process as yet, it needs a few more bitter lessons rubbed into it. And the alert ones, thrown back upon their hopes, are compelled to a new task of interpretation—the interpretation of *the slowness of the public to realize what it already knows.* And the interpretation is that *even this slowness has its place in development.* The wheel of experience turns slowly but ceaselessly and the wheel of progress turns at the same rate; it is for the seers to see and report; it is for all to wait.

This is not easy to be learned, the wisdom of waiting, of interpreting, of discovering beneath apparent inertia a resistless motion upward, of discovering in the midst of seeming death irresistible forces preparing the foundations of the new order: not next week, nor next election, maybe, but when the time is *right*—the only time, the earliest time that anything enduring can appear.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

"Was Jesus Christ a Jew?"—An Inquiry

A Few Side Lights on a Looming Question. The Testimony of Family Names and Places. Judah and Israel Separate and Distinct

IT IS recorded only once in His memoirs that Jesus Christ was called a Jew. On that occasion the name was applied to Him by a Samaritan woman who obviously had its religious or denominational meaning in her mind.

The statement that Jesus was a Jew is usually an echo of the common superstition which regards the Bible as a Jewish book and all the godly characters therein as Jews. It grows out of the same error which calls Abraham a Jew, and Elijah and Samuel and other Scriptural notables who had no connection whatever with the tribe of Judah. It is the same common error which permits Judah to usurp the name of Israel as if one tribe comprised all of that great people.

In this article it is desired, as in the previous one, in the issue of September 22, to avoid all questions of religious belief. From only one angle does it become important as a matter of religious belief whether Jesus was a Jew, and that is the angle of a prophecy which was held to declare that Messiah should come out of Judah. Whether this involves the necessity of His being actually and racially a Jew, a flesh and blood scion of the Judah tribe, will be discussed presently. The purpose of this article is to stimulate inquiry upon the racial or tribal status of Jesus which has been left so generally to tradition or hearsay.

Certain facts will be admitted at once by all familiar with the memoirs of the Four Evangelists in the New Testament. Among these are the facts that Jesus was never a favorite with the Jews, that he created a riot in the Jewish cathedral at Jerusalem, that he was hostilely pursued almost from the beginning by the Judeans, and that he spent most of the active period of his life outside the land of the Jews, that is, outside of Judea.

* * *

The *geographical facts* are worthy of consideration. The most familiar common designations of Jesus found in the Gospels are geographical. He is known as "the Galilean" and as "Jesus of Nazareth." Galilee was a province in Northern Israel at the farthest reach from Judea, and Nazareth was a town of Galilee. Neither Galilee nor Nazareth is a Jewish name. Both were terms of contempt among the Jews of Judea. Popular proverbs were current which denoted the low esteem in which both were held by the Jews.

What the Geography Tells Us

THE birth of Jesus is said in the Gospels to have occurred in Bethlehem, which is in Judea the land of the Jews. The Jewish Encyclopedia says (Vol. 7, p. 160) that Jesus was born in Nazareth, but the Gospel goes somewhat further and explains the relation between Bethlehem and Nazareth. It is distinctly stated (Luke 1:26, 27) that Mary the Mother of Jesus lived at Nazareth at the time of the Annunciation. Joseph, the reputed father, lived there also. Later in the ministry the crowd about Jesus referred to the whole family of Mary's sons and daughters as living there, and the Nazareth region was called "His own country." That both Joseph and Mary were Nazarenes and not Judeans is stated in Luke 2:1-3, where the Law of the Census is shown as requiring every taxable person to register at his own ancestral center—"And Joseph also went up from Galilee, out of the city of Nazareth, into Judea unto the City of David, which is called Bethlehem; (because he was of the house and lineage of David:) to be taxed with Mary his espoused wife." "And when they had performed all things . . . . they returned into Galilee, to their own city Nazareth" (Luke 2:39). They were not of the house and lineage of Judah, but of David—an important distinction as will appear under the discussion of Jesus' designation, "The Son of David."

The bulk of geographical references in the Gospels are to Galilee. The name appears everywhere. That country was the scene of Jesus' greatest exploits. Judea always appears as the land of danger. Repeatedly do the disciples warn Jesus against Judea, and it seems to be the critical opinion that only three times in His public ministry did He enter Jerusalem, the third time with "His face set like flint" because he knew it was the death city.

It has been somewhat overlooked, however, that Jesus was known to his contemporaries as a "Galilean." In the court of the palace Peter was accosted with the charge—"thou wast also with Jesus of Galilee (or *Jesus the Galilean*"); and in the civil trial before Pilate it is recorded—"When Pilate heard of Galilee, he asked *whether the man were a Galilean.* And as soon as *he knew that He belonged to Herod's jurisdiction* he sent him to Herod." Herod's jurisdiction was over Galilee. "Galilean" is a designation that remains to this day, and has its place in the determination of the question, "Was Jesus Christ a Jew?"

* * *

It is further a fact that *the disciples of Jesus were, with one exception, Galileans.* That is, they were not Judeans or Jews. The exception was Judas who managed the betrayal. Lest this statement should be regarded as a gratuitous fling at modern Jews, let the interested reader turn to the Jewish Encyclopedia, Vol. 7, p. 371, where it is stated that in the name Judas *Iscariot* the latter term means "a man of Keriot," this being a town in Judah, and where the further statement is made referring to the origin of the disciples—"Judas, being of the district of Judah, *while the rest were all Galileans.*" There was but one Judean among the disciples whose very name denotes his tribal derivation.

The sense of difference between the Jesus group and the Jews is constantly apparent throughout the Gospels, and nowhere more so than in the most beautiful of the Gospels, which is the Fourth, ascribed to St. John who is known in the church as the Apostle of Love. John always speaks of "the Jews" as an American would speak of the Russians or the Sicilians. And that this difference was more than religious is shown in the experience of St. Peter at the Court who, though desirous of concealing the fact that he had been with Jesus, was betrayed by his speech—"Surely thou art one of them: for thou art a Galilean, and thy speech betrayeth thee." "Ye men of Galilee" is the angelic address to them following the Ascension.

So that the Galilean character of the Apostolate is clearly fixed. Judas proving traitor, his place was taken by Paul, who was not a Jew of Judah but a scion of the tribe of Benjamin. Indeed, the first rejection of the Messianic claims by the Jewish national council was based on the Galilean fact—"Shall Christ come out of Galilee? Search and look, for out of Galilee ariseth no prophet." The antagonism of the Jews toward Jesus was not softened by his prophecies uttered *specifically against Judea,* upon which land he foretold the most terrible consequences—"O Jerusalem, Jerusalem . . . . your house is left unto you desolate . . . . let them which be *in Judea* flee into the mountains . . . . And as some spake of the temple, how it was adorned with goodly stones and gifts, he said, As for these things which ye behold, the days will come when there shall not be left one stone upon another, that shall not be thrown down." Obviously, the whole Jewish tone was absent from Jesus and his group. Peter, in his sermon before Cornelius, years after, still refers to Judea as "the land of the Jews." It is clear that "the land of the Jews" was not Jesus' "own country."

Jesus of Nazareth Not "of Judea"

NOW let it be noticed that in not one instance does the term "Jew" as used in the Gospels indicate the Galilean people. The Fourth Gospel uses the term "Jews" sixty-four times, not one reference being to the people of Galilee. Let it be also noticed that Galilee was situated in the territory of that greater part of Israel which had seceded from Judah centuries before. Upon the return from the Babylonian captivity the Jews settled in Judea and the Benjaminites, who originally belonged to Israel, settled in the north, and while retaining the Mosaic religion (then as now known as "the Jewish religion," although Moses was not a Jew) the Benjaminites were a separate people racially and psychologically. It was among them that Christian ideas first took root.

These are embarrassing facts against which to test the current charge or taunt that "Christians worship a discarded Jew."

After what has been said about Galilee, less need be said about Nazareth. But it is notable that no Judean place name is connected with Jesus. "Jesus of Nazareth," "the Nazarene," how amply do these testify the Galilean character of Jesus' reputation in the days of His ministry. Even today, "Jesus of Nazareth," "The Carpenter of Nazareth" are common terms, with not a Jewish note in them. But, of greater significance than what the crowd said, was the designation which Jesus himself acknowledged. At the time of His arrest, Jesus, according to the Fourth Gospel, went out to meet the officers—"Jesus . . . . went forth, and said unto them, Whom seek ye? They answered Him, Jesus of Nazareth. Jesus saith unto them, I am He." It is the name He twice acknowledged that night. He thus identified Himself in the vision to Paul on the road to Damascus. No name linked Him with Judah save that derisive inscription upon His Cross—"King of the Jews"—against which placard even the Jews protested.

Names in Jesus' Family Not Judean

THEN look at *the family names* connected with Jesus. Joseph, the reputed father of Jesus, possessed a name which went back to the original antagonists of Judah. The original Joseph was the son of Jacob and the father of two tribes, Ephraim and Manasseh. These two Joseph tribes held the rule in Israel as rivals of Judah for centuries, and after the secession of Israel from Judah it was the Joseph tribes that continued to be the head of Israel. Indeed the name of Ephraim is sometimes used in the Old Testament as synonymous with Israel. The name of Jesus' reputed father, therefore, is not a Judahite or Jewish name.

The name of Mary the Mother of Jesus was Miriam. The original Miriam in the history of Israel was the sister of Moses, and, of course, Miriam was no more a Jewess than Moses was a Jew. They were both of the tribe of Levi.

Then there is the name of Jesus Himself, which in its original form is Joshua. The original Joshua, savior of Israel, was not of the Judah tribe at all, but was a member of one of the Joseph tribes, the tribe of Ephraim, which had always disputed the ambitions of Judah and later headed the House of Israel. Thus we see in the names of Joseph and Jesus a recognition of relationship—as the first great Joshua was a son of Ephraim who was a son of Joseph, so Jesus of Nazareth was called Joshua, a son of Joseph. The Jewish note is entirely lacking.

The names of Jesus' relatives, called brothers and sisters in the Gospels, are not preserved to us save in two instances: we have the names of two of his brothers as James and Joses. James is originally Jacob—and Jacob was not a Jew; while Joses is related to the name Joseph which, as we have seen, cannot by any stretch of interpretation be given a Jewish interpretation. The family names of the family of Joseph and Mary, as far as we know them, give a decided impression of avoiding all Jewish reference.

* * *

A THIRD line of inquiry leads to the prophetic name given to Jesus as *The Son of David.* The first Gospel opens with the words, "The book of the generation of Jesus Christ, the son of David, the son of Abraham." Readers of the Gospels will not need to be reminded how frequently the people hailed Jesus as "The Son of David," an ascription of royal descent and therefore of royal succession. Does this fact tend to show that Jesus was a Jew? Was David a Jew? Was kingship over Judah and Israel a proof of pure raciality? Is it requisite that the lion of the tribe of Judah should be a product of Judah?

David, as we know, destroyed in his ancestry the boast of pure Judahite blood. One of his ancestresses was Rahab, the Canaanite harlot, and another was Ruth, a woman of Moab. He himself is described as "ruddy," or fair in complexion, a notable phenomenon among a black-haired people. He was a revolutionary against both Judah and Israel in his early days, and the record shows that he had more natural affinities beyond Judah than in it. He consorted with Canaanites and Hittites and Moabites; the host of the hated and hostile Philistines was a home to him. Foreign rulers received him with a consideration denied in Judah. David's sister married an Ishmaelite. David himself married as his first two wives a Jezreelite woman and an Ammonite woman. It is out of place here to go into Dr. Cheyne's theory of "Jerahmeel," but it throws some light upon the Arabian connections, if not indeed the Arabian origin of David. In any case, he was recognized (as at that time any king would have to be) as different from and superior to the people over whom he reigned. He was first chosen by Judah and then by the rest of Israel. In his time Israel and Judah lived together, although Israel raised two rebellions against him. The place of his birth presents some difficulties in name, raising a question whether it was in Judah, but that may be passed. These articles base themselves on the English text of the Bible alone.

In the previous article reference was made to the promise made to Abraham concerning the destiny of Israel. There is yet one more "covenant" or promise of destiny, and that was made to David. As we have seen that the House of Israel and the House of Judah were set opposite each other with distinct destinies, so now we see the House of David set upon a divine prophetic destiny distinct from the others. The record of the establishment is found in 2 Sam. 7, culminating in the words, "And thine house and thy kingdom shall be established forever before thee: thy throne shall be established forever." It is the apparent failure of this prophetic promise which occasions the bitter outburst of the eighty-ninth Psalm. At any rate, there are now three Houses—the House of Israel, the House of Judah, the House of David; Israel bearing a great world destiny, Judah obscured by separation from Israel, the House of David leading Israel in its world mission outside of Palestine.

Palestine Is Not "the Appointed Place"

IN THE charter establishing the House of David a note appears which should interest those who think of Palestine as the only prophetic strip of ground in the world and of Zionism as proof of Biblical prophecy. This note is in 2 Sam. 7:10—"Moreover I will appoint a place for my people Israel, and will plant them, that they may dwell in a place of their own, and move no more." Bible study has been so strongly under Jewish influence in the church that this very important statement has been overlooked. The establishment of David's throne has been strongly emphasized to be sure, because it is supposed to denote Jewish rule (which it doesn't) but this promise of the "appointed place" is ignored. Offhand most Bible readers who are under the influence of the Jewish method of interpretation would say that this "appointed place" is Palestine. Let us see.

"Moreover I will appoint a place for my people Israel." They were already settled in Palestine. The first verse of this chapter describes David as having rest from his enemies. Israel had possessed Palestine for 400 years—nearly three times as long as the United States has been a nation. The appointment could hardly refer to Palestine; the appointment of Palestine had been made nearly a thousand years before. The reference here is clearly to a place yet to be appointed—"I will appoint a place." What place, then?

"And will plant them?" Were they not already planted? We know that they were not. Israel went out of the land *and never returned.* Judah went out of the land and after seventy years part of it returned. The House of Judah did not officially return, but only a part of it which became known as "the Nation of the Jews." The scepter departed from Judah. From that day to this it has been a subject race. Temple and government alike are gone. Yet if the Bible is to be received as a true book of history past and present, "Israel" is "planted" somewhere.

"And will plant them that they may dwell in a place of their own." Palestine was not their own, it was the fruit of war. It was taken by force from other people.

And What a Best It's Been These Sixteen Years!

Walter Johnson Tells of His Career as a Big-league Pitcher

By A NEIGHBOR

WALTER JOHNSON

"You can't afford to worry over the defeat of today. Just figure out why you've lost, then begin to plan on the victory of tomorrow—if you expect to keep going."—Walter Johnson.

"HOW much longer do you expect to play baseball?" I asked my quiet, reserved neighbor.

"Well, I don't know," he replied. "It's a fascinating game and I love it. And the public—everywhere—has been mighty good to me. As long as I feel that I can win a game once in a while I'll want to stick. Just so long as the public wants me to play I expect to give it the best there is in me, for the fans surely have treated me fine. When the manager takes my uniform away from me I reckon I'll have to quit like the rest."

"Do you ever intend to go back to the minors when you quit the big leagues?"

"As things ordinarily go I wouldn't. But years ago there was a man who was my friend—he has been so all this time. He owns one of the best of the midwestern clubs. One time I promised him that when I quit big league baseball I would play for him one year. I'll keep my promise and play a season for him if I'm able."

So here, then, were the secrets of this man's success. He loves his profession, and, more, he loves his public and is grateful for its treatment of him. He tries to give the best there is in him—so the fans are always for him. He doesn't waste time worrying about today's defeat; simply uses its lesson as an added means to the end of tomorrow's victory.

It was hard to realize that this clean-spoken, modest, quietly dressed, frank-faced chap was the great Walter Johnson, premier pitcher of organized baseball in America. standing today on the topmost pinnacle of fame and success in his chosen line.

He is more like some prosperous, genial merchant, or broker, than an idol of the fans, the man who, on the diamond, receives the applause of the multitudes whether he is "whiffing 'em" as fast as the batters come to the plate or whether he is taking his glove to the bench after being "pounded."

Living cleanly—he always has—Walter Johnson is a real "early-to-bed-early-to-rise" man. His chief business in life is a perfectly winsome wife and four kiddies, three boys and a girl—Oh, yes, and an Airedale dog which insists on gnawing its bones in the front room on the best rug—much to Mrs. Johnson's chagrin.

The boy that came out of the sticks.

Modesty, clean living, quiet geniality and an intense love of his family and home are the dominant characteristics of the great hurler.

Much written about in sporting pages, Johnson is very seldom interviewed. He has pitched, not press-agented, his way to the top in his profession, and he much prefers to talk about others rather than himself.

One evening recently while making a neighborly call I had the rare good fortune to catch this celebrity of the great American game in such a mood that I was able to induce him to talk about himself, and he told me the story of his life, unconsciously dropping in here and there bits of the best sermon on how clean living pays, and gems of philosophy acquired on the diamond, I ever heard.

It was evident that Walter Johnson's interest is in his wife and children, the fans, the game itself, and his whole thought is to give them the best there is in him as long as he can. Personal fame, money, his own prowess—all these seem secondary in his considerations. He constantly voiced appreciation of his treatment by the public—indeed his attitude seemed one of half-wonder that the fans are so good to him.

It was a rare evening. In that big room of a beautiful home on Irving street, in Washington, D. C., with the subdued rays of the lamp casting soft, mellow shadows in the corners, the golden amber of the ginger ale sparkling in the ice-glasses, Johnson sprawled indolently in a big easy chair, the Airedale industriously polishing a bone at his master's feet. From upstairs the soft wail of the latest little Johnson floated down as the mother glided softly through the half-lighted room with a gentle, "You won't mind baby, will you? She's a bit restless."

As he affectionately scratched the Airedale's ear with a slippered toe, Walter Johnson warmed to the subject he loves—baseball—and bit by bit gave me the story of his life, his hopes, his ambitions, his failures.

In procession passed, in conversation, the great ones of the diamond: Christy Matthewson, Rube Waddell, Babe Ruth, Tris Speaker, Eddie Collins, Plank, Bender, Coombs and the others. And for each of them Johnson had a kindly, affectionate word.

"I was born November 6, 1887 on a farm four miles out of Humboldt, Kansas," he began.

"We had no near neighbors; there weren't any kids to play with, so up to the time I was fourteen years old I had never heard of baseball.

"Then my family moved to Fullerton, California, in the oil fields, and I started in high school. All the boys played baseball there, so I took it up and I liked it—I always have.

"I started my first game of baseball as catcher. Halfway through the game the kids thought I could throw pretty good so I was put in as pitcher—and I've pitched ever since."

By such trivial incidents is the course to destined greatness sometimes directed.

"I'll never forget that first game I pitched for the high school," Johnson continued. "I got beat 21 to 0.

"The next Saturday our club imported a catcher who could corral the balls and we played the opposing team on its home grounds. In fifteen innings the score stood 0 to 0. I was sixteen then, and I guess that's the greatest game I ever played.

"After leaving high school I went to work in the oil fields and attended business college in Santa Ana. One day I was a spectator at a semi-professional game. The manager of one team asked me to pitch for him. I pitched about a dozen games during that year and won a good part of them. I received about ten dollars for the whole series—and that was big money to me then, I tell you.

"In 1906 a friend of mine who was in Tacoma, Washington, persuaded me to join that team in the Northwestern League. But the San Francisco earthquake broke up the Pacific Coast League so the Northwestern could get all the seasoned players it wanted, and all of us young fellows were let go without being given a chance to do much.

"Following that I went to a little town in Idaho called Weiser. I dropped off the train and asked the way to the baseball headquarters. At that instant I saw my friend from Tacoma on the street—he had said he would be in Weiser—and he took me over and got me on one of the clubs. I played two months in 1906. I went back home that autumn and played a little here and there. The New York Giants were training in California that next spring and they were willing to take me on. But I didn't know anything about the Giants and I was afraid they might drop me off in the sticks somewhere without money enough to get back home, so I wouldn't go with them."

And thus it was Washington had saved for her club its Ace of Diamonds.

"I went back to Weiser in the spring of 1907. Those people were the finest I ever knew. Clean sports, they loved the game, and, although they bet big sums on the results, there was not a man of them who would have thought of trying to have a game thrown. They won like sports and lost like gentlemen—and loved the game for itself.

"I was getting what I thought was big money—a hundred dollars a month for playing one game a week and on holidays."

This sounded strange and amusing, coming from a man whose salary as pitcher for the Washington "Senators" is probably nearly twice that of the Attorney-General of the United States.

"As I developed I got to going fairly well and the coast leagues began to make offers to me, but I was afraid of what I then thought was 'the big league' and preferred to stay in Weiser."

That's the way Johnson put it. The fact was, he pitched eighty-six consecutive scoreless innings and had the West country wild.

"Yes, come to think of it," he admitted when I mentioned this, "I believe I did do something like that—but then, you know, those boys didn't know much about batting," he added, half deprecatingly.

"But later in the American League, with the Washington club, you pitched fifty-six consecutive scoreless innings, didn't you?" I insisted. "Yes," he admitted, "but I was just having a lucky streak, perhaps.

"Well, anyway, in 1907 Cliff Blankenship, catcher for the Griffs, was sent out to Idaho to get me for the team. But I was suspicious of those city fellows and I made 'em agree to pay my expenses BOTH ways before I would come. How the manager of the Washington club ever heard of me I don't know to this day. I have been told some traveling man told him about me, but I don't know. Anyhow, I've always had a warm spot in my heart for 'drummers' ever since just the same."

And now, from point of baseball years, Johnson is a gray and grizzled veteran. His record is sixteen years with the same team without a suspension, without a fine, without a fight with an umpire, without being ruled off the diamond once. The average baseball life of a player in a big league is from four to six years.

"Speaking of that streak in Idaho," resumed the great pitcher after he had persuaded the Airedale to go back to gnawing its bone instead of its master's slipper, "they imported Higginbotham, of one of the minor leagues, later of the Cubs, to pitch against me in a game between Weiser and Caldwell, Idaho, and he beat me 1 to 0. I always kind of hated that."

There was a kid, twenty years of age, always playing in the bush, beaten only 1 to 0 by a league pitcher—and the Walter Johnson of today still feels a little bad about that defeat.

"But even then I figured I couldn't worry about the defeat of today—just had to figure out how it happened and come back tomorrow and win.

"It was funny, but line drives, no matter how many bases they were good for, didn't cause much excitement in those days. But a high fly—man dear! how the crowd would rise up and yell!

"I came to the Washington club in July, 1907, and pitched my first game for the club August 2.

"I was a greenhorn right, and I guess the fast company sort of got me rattled for the first couple of years, for I sure fell all over myself when I tried to field—but the fans were good to me. They put up with it all and that's why I've got to give them the best I have in me always.

"Washington is home to me. If I had a chance to

(Concluded on page 14)

His Story Is Written in the Lives of Others

Thomas Arkle Clark, Dean of Men at University of Illinois, Confidant, Counselor, Disciplinarian and Friend of Students

By FRANK M. CHASE

AT AN age when most men who go to college are graduating, a lank, skinny youth was attending to the multifarious duties of an Illinois farm. In him burned a desire for an education, but there were obstacles in the way. He had never been to high school. Moreover, he was the main support of his mother and an invalid brother, and he could ill be spared from the farm work. Things looked hopeless indeed.

But into his life one summer came a force on which neither he nor his mother had counted. A boyhood friend, now a student, spent his vacation in the neighborhood. He had been to normal school for a year, and delighted in displaying the polish—the extremely thin polish—so acquired. He wore bright-colored clothes. He walked and talked in college terms, and declaimed numerous pieces that he had memorized. All this—especially the last named accomplishment—presented an attractive picture to the young farmer, and awakened anew his old ambition.

"If college can do that for a fellow," he decided, "then I'm going."

Oh, let's be patient the next time we see some young fellow thus flaunt a little learning! There may be results we least expect. It was the very ostentation of that misguided youth, for example, that started Thomas Arkle Clark, now dean of men at the University of Illinois and a recognized authority on students and their problems, on the road to a notably useful career. For Dean Clark originated the office of dean of men, and has probably done more than any other man to make the college life of America finer and more beneficial.

Probably not another person understands students with such thoroughness and sympathetic regard for their interests as Clark. During the twenty-two years he has occupied his present position he has studied them constantly. His office in the administration building is a veritable clinic in human nature. To the slender, gray-haired figure behind the big desk, his kindly blue eyes and friendly smile radiating the optimism of youth, the six thousand men students of the university take their troubles, their hopes, their joys and their sorrows; for Dean Clark is their confidant and counselor, as well as their disciplinarian, and throughout all, their friend.

Hundreds See Him Daily

HIS callers number into the hundreds every day: the average for a recent month was 354. Among them will be the student who neglected to pay his room rent, the one who must have a job or leave the university, and the young fellow who has been exceeding his limit of "cuts" or has been too lackadaisical generally to make the necessary grades. Whatever the difficulty, the dean instantly adapts himself to the situation and a solution is quickly reached. Rule-of-thumb methods, however, do not apply in his office, for each case is regarded as individual as the person most involved.

"I try to figure out each morning as I go to my office what form of student irregularity I shall during the day have to adjust," Dean Clark says, "but I am never successful. No two days are alike; every problem which is presented has something in it unforeseen and unlike anything else I have ever met. One might think, if he did not know, that, having seen fifty men during a year on fifty different sorts of wrongdoing, there would be nothing new, and that the next years would be a repetition of the old stories, but it is not true. Every case of discipline which I have had to do with was a special case."

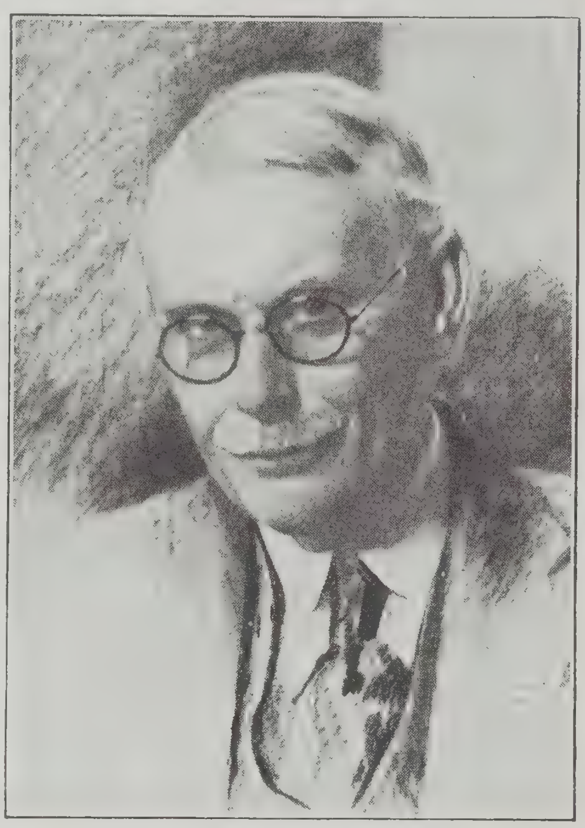
Though the students who tread the green carpet of the dean's office are his main concern, they do not represent all the activities of his busy life. Any unusual demand, night or day, finds him ready to go. He visits the sick and discouraged. He is called, often after bedtime, to help in adjusting some student affray with the police. He also knows thousands of students and alumni by name, and gives dozens of informal talks every year. Of him an associate on the faculty says: "Nobody goes to more dances and dinners, as well as funerals and faculty meetings, than he. He will manage to get around to a smoker, a meeting of church deacons, an operation on an undergraduate at the hospital, a dance, and a theatrical rehearsal in an evening, and be dictating letters at eight the next morning."

Dean Clark's sympathetic understanding of students, and the confidence they place in him, are rooted deep in his own experience. From his own student days he knows their troubles: the problems of the young man who must work his way, the temptations that beset the student politician, and the gulf that separates the fraternity man from his non-fraternity seatmate. He has also experienced many of the hardships of life, and knows the strength derived from obstacles overcome.

He was born at Minonk, Illinois, May 11, 1862. When five years old, his parents having moved to a farm, he began his education in a log schoolhouse. Two years later the family moved again, this time to a farm near Rantoul, only a few miles from the institution he was destined to serve so long. At the age of fifteen his father died, and, left as the main support of the family, his schooling stopped. Nevertheless he was able a few years later to pass the county teacher's examination, and at twenty taught a district school.

During all this time the towers of university hall beckoned him to come, but he could not see his way clear to obey the call. Then, the summer he was twenty-two, came the normal school student, and young Clark's determination to have an education. He could not, however, rush at once to college; the affairs of a farm cannot be closed up thus abruptly. Accordingly, he spent another year on the place, taught the district school near his home that winter, and the next autumn moved, with his mother and brother, to Urbana.

Having never attended high school, it was necessary for him to take some preparatory work in the university academy. To this he devoted himself so assiduously that the following autumn he was able to meet the entrance requirements, and enrolled as a full-fledged freshman in the university itself.



THOMAS ARKLE CLARK

As a boy he had harbored an ambition to be a physician. About the time he entered college, however, he was wavering between medicine, law, and journalism, the latter finally receiving the most serious consideration. Practical use of his journalistic bent was made, as he supplemented the five cents an hour which he received for working in the university library by writing for a local newspaper, putting in his spare time as a compositor. He also edited a sophomore publication, and was on the staff of the student daily three years, the last year as editor-in-chief.

The Men Who Should Go

DESPITE having to work his way, he made an excellent scholastic record. When he was graduated, 1890, he had been junior orator and class poet, as well as editor of the papers just referred to, and was a member of Phi Beta Kappa. He does not, however, advise students to work their way through college if they do not need to do so.

"Too many people attempt to work their way through college," he says in one of his numerous essays for the guidance of actual and prospective students. "It is only the exceptional man without money who should go to college. Many men say that they would not be able to save money if they went to work, but it is as easy to economize and to save money out of college as it is in, and the commonplace student should either not go at all, or he should work and save money enough to allow him to devote the greater part of his time to his studies; otherwise he is likely to fail."

After his graduation, Clark rose rapidly, though not in the profession he had chosen for himself; fate, indeed, seems to have put as many obstacles as possible in the way of his becoming a journalist. Instead he became a teacher, accepting a poorly paid position in the Champaign high school to be near his mother.

Successively he was then an instructor in the academy, instructor in English in the university, assistant professor of rhetoric, and professor of rhetoric, coming to the last named position in 1899. Meanwhile he had grown to like teaching, had found time for a summer of special study at the University of Chicago and a year at Harvard, and was about to settle down in the belief that he had found his life work. He also still clung to his literary ambitions, which, as a professor of rhetoric, he had a fair opportunity to realize. Moreover, as virtual head of the English department, he had done a good job of outlining its work and building a staff, having secured, among other able instructors, no less a man than Stuart P. Sherman, who is now famous as a literary critic.

About this time the dean of the college of literature and sciences was absent from the university for a year, leaving Professor Clark in charge. Though he still holds the title of professor of rhetoric, having taught a course in the subject until a few years ago, his classroom work was thereafter to be a side line; for during the year he was acting dean he assisted the president in two difficult cases of discipline, in the handling of which he displayed such insight into student nature that a special position was created to make use of his ability. This was in 1901. The office, then unheard of in any university, was known as "dean of undergraduates and assistant to the president." In 1904 it was modified to "dean of undergraduates," and in 1909 to "dean of men."

While the position was established with a view to relieving the load of the president in disciplinary matters, Dean Clark practically made his own job. He instituted a system for reporting the scholarship and absences of each student; he began to help those needing work to find it; he began to study hazing, student graft, dishonesty, unwholesome fraternity conditions, and the innumerable other factors contributing to student problems. During the first few years of his office Dean Clark supervised the women as well as the men in some matters, but since the coming of a separate dean for women in 1909 has given all his attention to the men. Even so the work has proved too much for one man. An assistant dean has been employed since 1910. The coming year he is to have three half-time assistants.

He Knows Fraternities

FRATERNITIES have long received special attention at the hands of Dean Clark, and probably not another man in the United States can speak of them with the same authority.

His attitude in general is singularly fair and incisive. He willingly grants that they have a rightful place in college life. He does not condone all their acts, to be sure; nor does he regard them as the sinks of iniquity some uninformed persons hold them to be.

Clark has been a powerful influence for bettering these organizations. He has been called the "Apostle Paul of the Greek-letter fraternities." In 1920 he was made educational adviser to the Inter-Fraternity Conference.

Better to understand college men he has followed their educational path back to high school, as a result of which he also writes and speaks authoritatively of the high school boy. His book, "The High School Boy and His Problems," is packed with understanding of the subject, and has proved helpful to the teacher and parent as well as to the boy himself.

Dean Clark seldom loses track of the men he has disciplined. Scattered among the hundreds of students who visit his office, and the other hundreds of alumni who come to renew their acquaintance at homecoming or commencement, are those he has had to punish, returning perhaps to thank him for what he had done.

"Even if their dismissal is a permanent one they write to me, or send me messages, or drift at intervals in a friendly way across my path," he says. "I count them among my closest and warmest friends. There is never a Christmas that I do not hear from some of the once derelicts who send me good wishes or the baby's picture. It gives me the greatest pleasure to know that these men are almost without exception doing a man's work in a manly way, and that out of their discipline has come for them a real strength of character."

Two other qualities stand out prominently in Dean Clark's exceptional personality. These are his unwavering reverence for the truth, no matter how it hurts, and his sense of fairness. A glimpse of both are seen in the credit for his success that he generously bestows upon others.

"I think it is hardly fair to write an article about me without saying something about the two women who have meant more to me than any other influence in life," he said while this sketch was being written. "My mother stimulated me for many years to do the thing that I wanted to do, and my wife has kept up the stimulation for the last twenty-seven years. If it had not been for these two, I could not have done half the things that I have been able to accomplish, even though I have accomplished relatively little."

Words, after all, scarcely tell the story of Thomas Arkle Clark. It is best written in the lives of others.

'Camp That Came From Nowhere in No Time': Goldfield, Nevada

Two Blades of Grass "Only Lawn in Town"

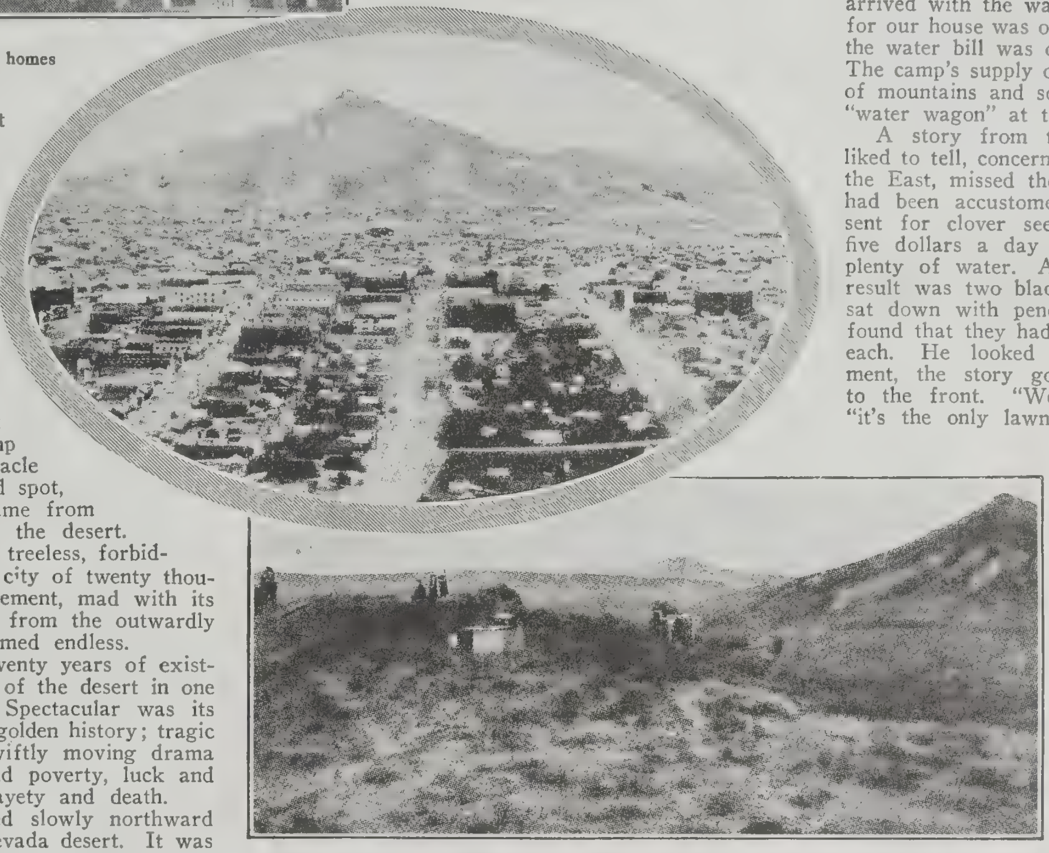
By EDITH M. GAHAGAN

A Goldfield school surrounded by typical homes of that city.

TOILING wearily to the crest of a low ridge of Nevada hills on a December day in 1903, a dusty old prospector gazed out over a far-reaching, desolate waste of sand and sagebrush. The mournful howl of a coyote rose from a distant lonely hill; a lizard glided away from his foot; no sign of human habitation met his eye. As he stumbled down the slope with his pack-laden burro reluctantly following, a gleam in a rock beside him caught his eye—and as if an Aladdin's lamp had been rubbed, a modern miracle was performed in that lonely, arid spot, and Goldfield, "the camp that came from nowhere in no time," rose from the desert.

Feverishly built on a waterless, treeless, forbidding plain, in two years it was a city of twenty thousand, teeming with life and excitement, mad with its thirst for the gold which poured from the outwardly barren hills in a stream that seemed endless.

In July, 1923, after a scant twenty years of existence, it was swept from the face of the desert in one short day of devastating flame. Spectacular was its entrance on the stage of Nevada's golden history; tragic the final curtain; but into its swiftly moving drama were written scenes of wealth and poverty, luck and failure, exultation and despair, gayety and death.



Above—Bird's-eye view, Goldfield, Nevada. Below—Where Goldfield came from. The naked desert before the stupendous rise that brought this remarkable town into being. Harrie Taylor (discoverer), Lew Finnegan and John Y. McKame on the Jumbo, from which was taken $100,000 in forty-seven feet from surface, the strike that caused the first rush.

The long freight train crawled slowly northward through the dreary expanse of Nevada desert. It was a hot August day in 1911. The sun, scorching down on this land that knew no shade, had driven the temperature to 115. A desert dust storm was blowing sand through every crack and crevice of the last car, which was, surprisingly, not the usual caboose, but what had been an ordinary day coach. By the simple insertion of two partitions, the car was serving the triple purpose of baggage car, smoker and passenger coach; for this was the combination freight and local of the Tonopah and Tidewater Railroad, which ran one train daily from Las Vegas, in Southern Nevada, two hundred miles north to the mining camps of Goldfield and Tonopah.

Among the passengers was only one woman, a school teacher from Michigan, the writer, in fact. The lure of gold had called me, too, for it was the offer of the Goldfield school board to pay me what was considered a princely salary—double the best that Michigan then had to offer—that had brought me adventuring here. And "an adventure" it seemed, in truth, for the consensus of opinion back home had warned me that Goldfield was a place notorious for its rough mode of living, inhabited mostly by murderers, gamblers and rattlesnakes; certainly, they agreed, no proper home for a girl from the civilized East.

But when our desert special pulled into the camp, just as the sun slipped behind the Malaipi, and the delicious coolness of a desert evening brought relief from the gruelling heat, I stepped from the train into a modern depot scene of bustling agents and bus drivers calling their hotels, and to the greeting of the superintendent of schools and the president of the board, who had come personally to meet me.

Two outstanding characteristics of the Goldfield spirit, hospitality and prodigality, were demonstrated to me before the evening was over, for I was dined at the superintendent's home, a pleasant room had been selected for my approval, and before the school board official left, he said, "Guess I better tell you tonight that we have raised your salary. We thought we must economize a little, so offered you less than the others are getting; but when we got together last night, I said, 'Boys, it's a dirty shame to let a girl come all the way from Michigan for less than the regular salary. Let's boost her up.' They agreed, so if you'll drop around to my office tomorrow, I'll have your new contract ready to sign."

Although referred to in local parlance as "the camp," Goldfield was no longer the chaotic tent-and-shack colony of the boom days. The population of 20 000, that flocked there almost overnight at the first cry of gold, had melted to a possible 6,000, the stabilizing element which had built a city of homes, schools, churches and stores, with railroads reaching north and south, in the heart of a great desert where nature had supplied no factor for sustaining life, except the gold whose gleam had beckoned men into the loneliness, and the lavish use of which had made a city possible.

Faith in the inexhaustibility of each new El Dorado marked the construction of western mining towns. And Goldfield, like the others, was built as if for all time. Splendid public buildings were erected of brick and stone. The camp was proud of its four schoolhouses, equipped with every up-to-the-minute device for successful teaching, the three churches, a hospital, banks, clubs, a fire-station with snappy apparatus, pretty homes.

But the boast of the town was the famous Goldfield Hotel, around which centered much of the social and business life of the camp. Built at a cost of half a million dollars, it held the reputation of being the finest hostelry between Denver and the coast. Easterners arriving in camp, resigned to putting up with rough accommodations, never failed to be charmed by the conveniences and service at "The Goldfield." Out-of-season delicacies of food that the New Yorker was fond of ordering at the Ritz-Carleton could be found in its dining room, though it had been shipped in at tremendous expense from California. And, needless to say, the stranger paid well for his meal.

The necessities of life, we found, as well as the luxuries, came high in Goldfield. When a town's daily bread and the fuel for baking it and the water with which to wash it down and the light by which it is eaten, all have to be transported more than a hundred miles, the price must be paid. Rent was the one exception, for the camp was already facing the tragedy of empty houses. We rented an attractive bungalow for twelve dollars a month—our one excuse for rejoicing, financially speaking—but a sad moment always arrived with the water bill on the first of each month, for our house was one of the few piped for a bath and the water bill was often fifteen dollars for the month. The camp's supply of water was piped over two ranges of mountains and sold to the consumer from a literal "water wagon" at two cents a gallon.

A story from the first days that the old-timers liked to tell, concerned a tenderfoot who, arriving from the East, missed the abundance of grass to which he had been accustomed. Determined to have some, he sent for clover seed and fertilizer, hired a man at five dollars a day and gave him instructions to use plenty of water. At the end of the season, the net result was two blades of grass. When the possessor sat down with pencil and paper for a reckoning he found that they had cost him just five hundred dollars each. He looked somewhat chagrined for a moment, the story goes, but his optimism soon came to the front. "Well, anyway," he said with pride, "it's the only lawn in Goldfield."

But in spite of the high cost of verdure, Goldfield had acquired a few trees in the course of years. The home of Tex Rickard, a neat red brick, boasted a fringe of saplings which gave to the corner an air of affluence and a refreshing spot of green; and across the street, on either side of a little path, were two squares of real grass, carefully protected from wandering burros by another innovation in Goldfield, a fence.

Tex Rickard's prominence in camp was not due to his trees alone, by any means. He had turned the national limelight on the town and himself by promoting the Gans-Nelson prize fight there; and he owned and operated the once famous, now deserted, Great Northern saloon, styled the "Monte Carlo of America" in the glad, free days when gambling was at its height, and the old rooms were crowded day and night with men and women who won a fortune or lost one with the easy nonchalance which gambling etiquette demanded of a good sport. From poverty to wealth, and back to poverty again in twenty-four hours, via the Great Northern, was no uncommon occurrence in that atmosphere of uncertainty. The Cherry Malotte, of one of Rex Beach's Alaskan stories, they told us, was at one time a frequent figure at the roulette table.

We went one day with an "old-timer," who was full of stories of early days, to see the famous back room that had been the scene of such stirring life. The roulette wheels and faro equipment lay under a thick pall of dust; but the place seemed peopled again with life and strife and madness as our guide told of this murder, or that suicide, and of the lucky few who won—and went.

Much camp lore clung around the building which housed the Montezuma Club. This was virtually Goldfield's first town hall, for the Montezuma members were the influential men of the raw, crowded camp, who met here to administer by moral force some form of law and order while waiting for the legislature to grant a city charter. "No professional gunmen" was one firm rule they made, and as a result, Goldfield's first year was not marred by the many crimes of violence that had given its predecessors a picturesquely bloody history.

They burrowed in the ground when Goldfield was in the building. A group of first residences.

Goldfield's golden present, Goldfield's golden future, the possibilities of the latest strike, the tale of some lucky miner made a Midas that day, these were topics for the conversation in the Montezuma's rooms. And it was worth listening to, for more reasons than mere entertainment, as the venerable darky janitor could testify after he had cleaned up $100,000 from tips as to the best stock to buy, caught while mopping floors.

In 1912, we found many substantial homes dotting the residence section of the camp. Hobnobbing side by side with them, in a merry "The Colonel's Lady and Mrs. O'Grady" camaraderie, were the crazily built one-room shacks, mute reminders of the time when any shelter was at a premium. When thousands of people dropped in

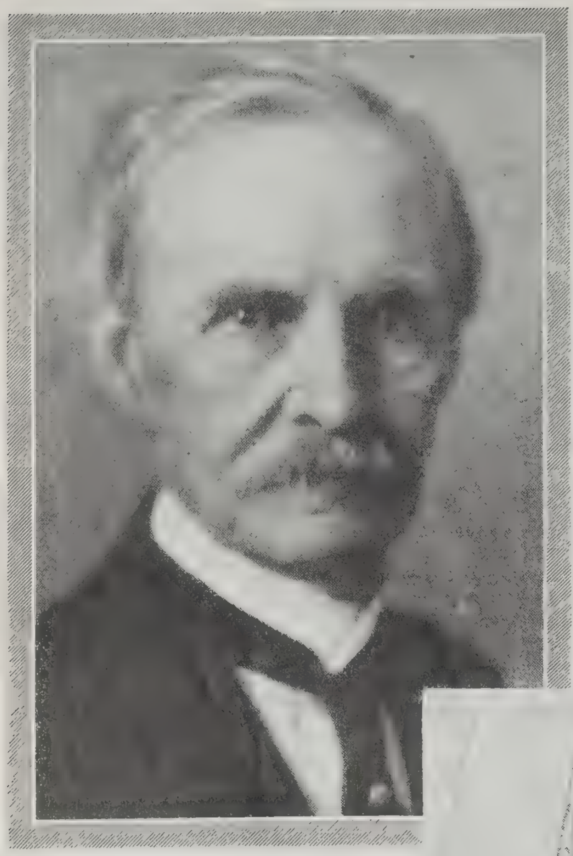
This Cat Never Came Back But It Served Its Purpose

And May Well Be Responsible for Inventor's Fame

By S. R. WINTERS



DR. JAMES HARRIS ROGERS

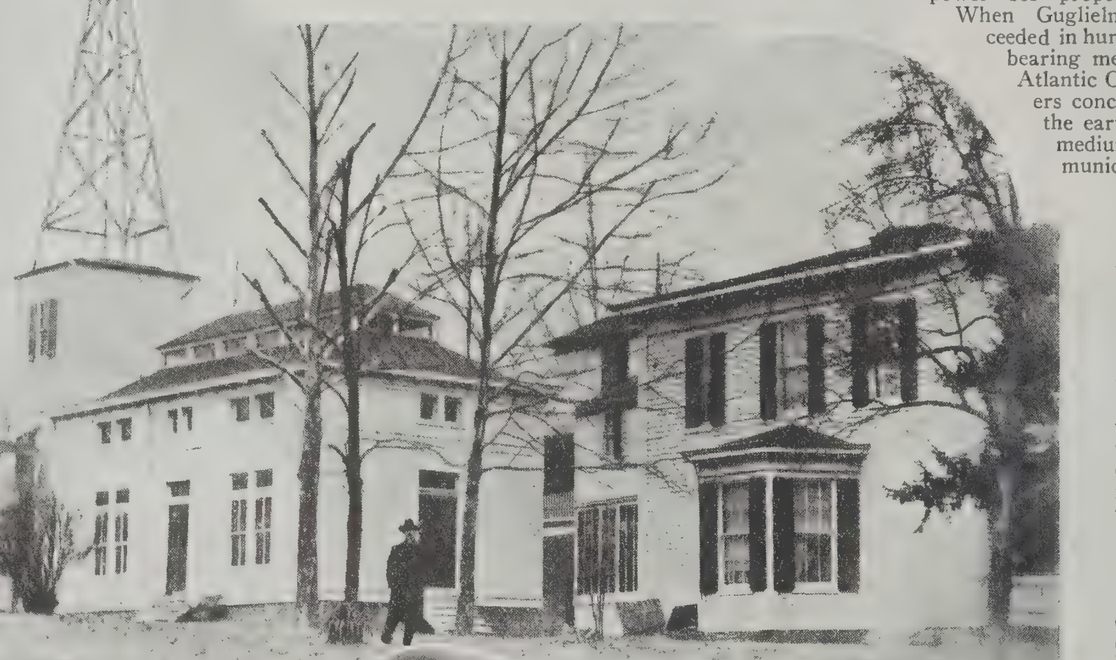
CATS, black cats in particular, have an ominous meaning to many when crossing their pathways. There is, at least, one instance, however, in which a cat did not forecast bad luck.

When James Harris Rogers was fifteen years old he was conducting experiments in electricity. His studies of the apparatus and methods of communicating by means of Morse telegraphy called for the devising of a repeater which would require little quantity but great tension or voltage. The originality and perhaps not too great regard of this boy for cats suggested the use of a "live-wire" repeater. He readily obtained a stray animal. A boot was adapted as a container for the animal. The toes of the boot were cut off so that the hind feet of the cat protruded and two holes were made in the upper portion of the shoe that the front paws would not be confined. The primary current of the high-tension circuit passed through the feline, the effects produced on the cat causing its paws to respond to the dots and dashes. By placing the Morse telegraph key on one paw and connecting it to a secondary circuit the cat acted as a repeater. Once unleashed the cat jumped from a second-story window. It was one cat that never came back.

Had not the cat responded to James Harris Rogers' boyish experiments in electricity fate might have pitchforked his efforts into another groove. As it is, the scientific world has the privilege of recognizing Dr. J. Harris Rogers, inventor of the underground and underwater systems of sending radio communications. This citizen of Hyattsville, Maryland, has for fifty years conducted experiments in electricity and allied sciences, and the fruits of his ingenuity have been crystallized into fifty inventions.

Built in 1906, the first floor of Dr. Rogers' laboratory is literally jammed with instruments, old and new, some of which have been developed by Doctor Rogers or are used to further his experiments. Radio apparatus is predominant, of course, as Doctor Rogers is continually experimenting with this form of communication, with special reference to the sending of messages through the earth instead of through space. The rear room of the laboratory is reserved for experiments in transmitting and receiving communications beneath the surface of the earth. An antenna in the form of a loop containing a number of wires is buried in a well under this back room of the workshop.

Outside the laboratory walls may be seen an iron pipe which extends for one hundred feet. Projecting from the laboratory, some distance above the ground is a conning tower. This arrangement was devised to simulate a submarine, whereby experiments could be conducted with respect to the sending of wireless messages under water when submarines were submerged at varying depths. Alfred Crossley, a radio engineer of the Bureau of Engineering of the United States Navy Department, conducted various experiments for the Government with this make-believe submarine. Subsequently, installations of radio apparatus were made on actual submarines and, as an outgrowth of this system, practically all submarines in service today are equipped for the sending and receiving of wireless communications. At first, a trailing wire was suggested as a means of picking up electric or radio waves on submarines, but this proved to be objectionable since a 200-foot wire would likely become entangled in this form of water craft or the wire would whip itself into two pieces. Consequently, the system finally determined upon involves the using of one-half of the submarine for the loop antenna—or "ears of radio," if you will—and the other half extended above the submarine and "grounded" at the bow and stern. The center of the upper wire is brought down into the submarine at the so-called conning tower.



Dr. Rogers at his home in Hyattsville, Maryland. Note the towering antenna at the left of the photograph which has been displaced with the underground system.

(C) U. & U.

General John J. Pershing congratulating Dr. J. Harris Rogers on his discovery of a system of sending radio messages underground.

During the World War, in 1916 and 1917, extending from this laboratory for distances varying from 200 to 5,000 feet were wires buried under the surface of the earth. They were insulated in various ways and some were bare, but those contained in iron pipes were most effectual in serving the purpose for which they were designed. These installations marked the shaping of a remarkable theory, namely, that electric waves travel through the earth as well as through space.

"What manner of man is Dr. J. Harris Rogers?" the reader doubtless inquires. First and foremost, he is democratic in his tastes and liberal in tendencies—he entertains General John J. Pershing in a way befitting the occasion or conducts the humblest citizen of Hyattsville through his laboratory with painstaking interest. His hair is snowy white, and although he was 73 years old in July of this year, he can use an auger in drilling a hole or the soldering iron in welding together wires with quite the deftness displayed by his young nephews who assist him. There is an unmistakable kindness about his face, a warmth of touch to his welcoming hand. He is a bachelor, and if he has any other hobby than that found among a multitude of instruments in his workshop this writer failed to bare it.

The father of James Harris Rogers was a student at Princeton University under Joseph Henry, a distinguished scientist. It was the latter who secured for young Rogers a position as electrician at the Capitol in Washington. His first attention in the direction of wireless experiments was attracted by the pioneer investigations of Dr. Mahlon Loomis, a dentist of Washington, who sent the first radio message over a short distance between points in the Blue Ridge Mountains. At the conclusion of the Civil War, James Harris Rogers and his father bore letters of introduction to Commander Maury, who was known as the pathfinder of the sea, to demonstrate to the latter the use of wave power for propelling small boats.

When Guglielmo Marconi succeeded in hurling electric waves, bearing messages, across the Atlantic Ocean, Doctor Rogers conceived the idea that the earth formed another medium for inter-communication. His theory had been sufficiently established during the progress of the World War that his workshop was the only private radio laboratory permitted to function during this conflict.

When a town turns out en masse to do honor to a citizen there is reason to believe that the particular individual thus honored has rendered service to humanity either locally, to the State, or Nation. Yet Hyattsville, on parade, rendered appropriate ceremonies in appreciation of its distinguished fellow citizen. The resolutions of appreciation, among other encomiums, contained this sentiment, "When our country was in peril he worked ceaselessly in his laboratory, and, when means of communicating quickly with our forces upon the sea and in France became imperative, he had perfected his discoveries, and turned over to a grateful nation his underground wireless and undersea methods of communication." The General Assembly of Maryland by unanimous adoption agreed that "Doctor James Harris Rogers, of Hyattsville, Maryland, has marked an epoch in scientific achievement in 'Radio' by the discovery of the underground and underwater system of radio communication." The Georgetown University has conferred the degree of doctor of science upon him, and he has been awarded the inventor's medal and made an honorary fellow of the American Academy of Sciences. The United States Navy Department in testimonials of liberal praise have attested to the value of his scientific contributions.

Surely, it must be gratifying for one to reach the evening of life amid the plaudits of home-town citizens as well as those of state and national figures by reasons of well-earned recognition because of having advanced the progress of a people. James Harris Rogers has wrought long and well, and, although for many more years doubtless his creative genius will continue to exert itself, he could now well rest upon his laurels—the fruits of science and research which have accumulated to his credit.

If a visitor to Washington contemplates inspecting the inventor's laboratory, to which one receives a courteous welcome, Hyattsville, Maryland, where Dr. Rogers has lived for more than thirty years, may be reached by automobile by traveling one of the highways stretching northward from the Capitol. By trolley the six miles between the city and the little Maryland village of 4,000 are covered in about thirty minutes. The cars stop in front of the village drug store to the rear of which are located the home and laboratory of Dr. Rogers. At the rear of the home is the two-story laboratory, the workshop of this distinguished inventor.

About the only equipment which does not have an immediate bearing upon developments in science is a flat-top desk. Everywhere else are X-ray tubes, vacuum tubes, radio receivers, apparatus for sending by radio and other bits of things worked out by Dr. Rogers during the years he has spent in research.

Milwaukee Opens a Municipal Savings Account

Its Cash Basis Plans Attract Attention of Entire Nation; City Will Be Free of Debt in Forty Years

By WILLIAM H. WENDT

City of Milwaukee No.

COMPTROLLER

PAY TO THE ORDER OF

MILWAUKEE May 25th, 1933.

PUBLIC DEBT AMORTIZATION FUND $398,239 15

Three Hundred Ninety-eight Thousand, Two Hundred Thirty-nine and 15/100 Dollars

To First Wisconsin National Bank, Milwaukee, Wis.

COUNTERSIGNED

CITY TREASURER
DEPUTY CITY TREASURER

William H. Upmeyer, Chairman Milwaukee Public Debt Commission, receiving from City Treasurer John I. Drew, the check which initiated the city's Public Debt Amortization Fund; Louis M. Kotecki, City Controller of Milwaukee, standing, initiated the plan and carried it through the legislature, with the unanimous support of the mayor, common council and prominent bankers and citizens.

IN 1963—40 years hence—Milwaukee will be debt-free and its permanent public improvements financed on a cash basis without the 50 per cent overhead burden resulting from the issuance of bonds for such purposes.

It will all come about because of the Milwaukee Public Debt Amortization Act passed by the Wisconsin legislature. This act, its sponsers claim, will not only retrieve Milwaukee from all debt but may eventually relieve it from all forms of municipal taxation.

Milwaukee has obtained permission from the legislature to open a savings account. That is the substance of the act. If you do that as a private citizen, you are a savings depositor—as a city, you are creating a Public Debt Amortization Fund. It is all based on the principle that compound interest piles up rapidly and the belief that a city should have as much pride in its financial stability as each citizen has in his or her personal affairs.

The Milwaukee plan, as it is called, is attracting national attention, because it marks the beginning of an entirely new fiscal policy for municipalities. If great funds can be set aside to multiply themselves, the imagination readily pictures debt-free cities, colleges, states, ultimately the nation. All of which should elicit a few rousing cheers from the overburdened taxpayers of the great American cities.

This is not a socialistic or radical scheme. The idea was conceived and carried out by city officials without regard to politics, and with the full support of bankers and financiers of national reputation.

The fund was actually started in June with $400,000 when the city treasurer presented the Public Debt Commission of Milwaukee, designated in the act as custodian of the fund, with a check for that amount and the commissioners promptly invested it in United States Treasury notes bearing four and three-quarters per cent interest, purchased at a price which will net the fund 4.60 per cent until March, 1927. This sum represents interest earned on installments of street improvements which the city is financing as a part of its previously organized cash basis plan, all of which was made immediately available under provisions of the act.

To this will be added all future interest from the same source, approximately $100,000 each year, without further action on the part of the common council. In addition, one-third of all other interest earned on city funds will automatically be turned over to the fund by mandate of law. The total available each year will not be less than $250,000.

Thus, Milwaukee has started with a savings account of $400 000, the principal of which will be annually augmented by at least $250,000, plus the interest earned on its investment in Milwaukee or other Wisconsin municipal bonds or Federal certificates of indebtedness.

Here is the way—assuming that the very lowest sums required by law are saved and the interest rate is four and one-half per cent—that the fund will grow:

In ten years it will be $3 437,950.

In twenty years it will be $8,549,136.

In thirty years it will be $16 486,808.

In forty years it will be $28,794,013, approximately the size of the present bonded debt of Milwaukee.

In fifty years it will be $47,927,102.

On a total principal of $12 650 000 appropriated by the city for fifty years, the fund will have earned or increased through the accrual of interest the sum of $35,277,102, the interest earned being almost equal to three times the principal involved.

Assuming that the city will cease adding the $250,000 to the original $400,000 each year when the fifty years are up and simply invest that $47,927,102 at four and one-half per cent interest for another 50 years, at the end of that time the amount of the fund will be $432,142,678. The annual interest on 432 million dollars would pay all the taxes assessed at present in Milwaukee.

However, the law provides that when the fund reaches an amount equal to three-fourths of the total bonded debt of the city then three-fourths of the interest on the fund may be diverted to the purpose of paying interest and principal on bonds or for financing permanent public improvements. Under the mandatory provisions, it will take thirty years to arrive at this point, although the fund will treble itself within the next twenty years.

There are several considerations which will counteract this and increase the size of the fund. The common council may turn over to the Public Debt Commission all interest earned on city funds, in which event the present estimates will be more than doubled. The council may appropriate any additional amount it sees fit and thereby hasten the time when the city may become debt and tax free. Every $100 000 annually added to the minimum amount will increase the fund by $18,683,100 at the end of fifty years.

Milwaukee is gradually putting all city departments on a cash basis, and within another ten years all taxes will be provided in advance. This means that city deposits will be larger, and the interest earned on daily balances in the banks will be increased. It will in turn result in an increased amount turned over to the amortization fund under the mandatory provisions of the law.

Furthermore, in the last ten years the city has sold $33,000,000 worth of bonds at an average interest cost of 4.83 per cent to the taxpayers. It is therefore reasonable to assume that the fund may be invested to earn in excess of four and one-half per cent, the basis used in these computations, and result in a further increase in the fund.

In addition, the Public Debt Amortization Act makes provision for establishment of a civic foundation to which public-spirited citizens may donate money, either by will or during their lifetime. Sums so received shall be held in trust forever and invested under strict provisions; part of the interest may be used to pay off debts of the city or to finance permanent public improvements.

Under the terms of this section of the act, the County and City Public Service Employes Union has donated $100, which is perpetuated by contract with the Public Debt Commission. Words cannot picture the ultimate growth of this hundred dollars; figures will stagger the imagination. At 300 years it will approximate fifty millions of dollars.

The principal objection to the amortization plan was that, after all, the taxpayer is footing the bill in establishing the fund for the benefit of future generations. But the difference in the tax rate, were the fund not in existence, is surprising. It is only fifty-five cents for each $1,000 of the assessed valuation.

If the $250 000 which must be added next year were applied to reduction of taxes, the rate would be thirty-five cents a year per thousand less—and most persons agree that this munificent sum is of small moment if the taxpayer can be assured that taxes will come down year by year, with a tremendous reduction the ultimate result.

Some financiers believe that actually purchasing city bonds in the open market and retiring them would be a better method to employ; but this would only result in widening the margins permitting of further bond issues and result in practically no gain. The Amortization Act provides that the fund shall not be used as an offset to the constitutional debt limit. The city has practically reached the point where it can annually issue only an amount equal to the bonds paid. A slight increase resulting from annual increases in assessed valuation permits of some additional extension of this limitation, but it is not anticipated that this will result in any great increase in the city's bonded debt in the years to come, especially since Milwaukee has long since seen the error of bond issues and financed many improvements of recent years by direct taxation. Since its issues are limited while the interest thereon accrues without compounding, it will readily be seen that the amortization fund with its feature of compound interest and its flying start will rapidly overtake the bonded debt.

Nothing, expert statisticians assure us, is impossible when it comes to compound interest. The sum of one dollar, bearing interest for a sufficient length of time, will pay almost any city's debt.

The Milwaukee plan is now in effect. Milwaukee has begun to sail on a strange course, over uncharted financial seas; for who ever heard of a city trying to save enough money to pay its debts? Time will tell how well the idea will work out. If it proves to be all that is claimed, posterity will have much for which to thank Milwaukee.

Continuing a Story Begun on March 19, 1921

Not Acting President, So People Expect to Hear From Coolidge Himself

By A. R. PINCI

In THE DEARBORN INDEPENDENT of March 19, 1921, Mr. Pinci wrote concerning the then newly installed Vice-President as follows:

"The Thirtieth President?"

"Calvin Coolidge, the thirtieth President of the United States! It is a rather startling prophecy on the eve that the twenty-ninth President enters into his new duties at Washington . . . . It is no reflection or offense to the incumbent to speak of a successor, but part of the game: preparedness—to use an overworked word. And there may be method in President Harding's desire to include the Vice-President in his Cabinet meetings. It looks as though he is teaching Mr. Coolidge his P's and Q's."

A FEW weeks ago ignored and overlooked by not a few even forgotten; today, and for some time to come, one of the two most talked-of and talked-about men in the world.

That is Calvin Coolidge, thirtieth President of the United States.

As it was in these columns, fifteen days after his inauguration as Vice-President, that I predicted his incumbency to his exalted office, it is but a fitting task—albeit an uneasy one, too, because of our national bereavement—that I should take up now the story begun March 19, 1921.

To repeat, a few weeks ago no one thought of Calvin Coolidge, man or Vice-President, at all; but during the time elapsing between President Harding's death and burial every conceivable writing instrument was used at almost every meridian and latitude point to say something about the "new man." The drama of San Francisco focused public attention upon the man actually making hay in Vermont.

This much is certain, however, that Calvin Coolidge was no greater man the moment after he became President than he was a week or a year earlier. The oath did not precede, follow or accompany any sort of miracle by means of which President Coolidge became a greater or better individual than was Vice-President Coolidge. Calvin Coolidge should be, as President, Calvin Coolidge more than ever.

On the contrary, a loquacious and not disinterested minority has not hesitated to make certain commentaries which, being inspired or suggestive, are apt to distort the natural likeness of President Coolidge, which is a pity, because he merits the retention of his individualism, even in his new official capacity, and should be permitted to retain it.

It violates no propriety, my stating that in a political and administrative sense—and the two are not necessarily interchangeable—President Harding had made many friends of 1920 critics and antagonists and, conversely, had lost many supporters of the same chronological brand.

The question arises, therefore, whether President Coolidge, in inheriting the Presidency, must inherit the strictly political and individual assets and liabilities surrounding the office. Does the Vice-Presidential fashion of succession to the higher office actually proscribe individualism and personal responsibility, or is the synchronousness of duty limited solely to the spirit of the party in power?

The conjecture is replete with possibilities.

It is not a question of how much President Coolidge *will* assume of the extant party burdens and complications as it is a question of whether he *must*, and if so, why. He is free, if he so desires, to remain a figurehead by the simple expedient of permitting the Harding officials to continue everything on the Harding basis, without interjection of any individual Coolidge government; that is, to sign his presidential name to posthumous administrative policies.

But must he do that?

Mr. Coolidge is a strict party man—enough so to leave no question that he is a Republican, that he has been that and that he can be nothing else. He has never emphasized that position, but his unilaterality has been unmistakable. He considered the election a mandate, and it cannot be doubted that that will be his motif.

During the twenty-nine months of his Vice-Presidency, Mr. Coolidge said just enough to paint some of his party's achievements in tints that are not Rubensian. For example, he told Indiana that the Harding Administration was "wiping away the tears of the world," and at another time he repeated the popular Republican view that no administration fell on more difficult times than this one.

The most harmless metaphor is a dangerous thing in political parlance. The one just referred to was the most extravagant statement I have known Mr. Coolidge, as Vice-President or governor, to make. If he believed that, then it won't be long before he will be disenchanted.

At the Cabinet meetings, which are after all the most important part of administrative government, in which Mr. Coolidge participated, three minds have been the magnetic and dynamic ones, not counting an extraneous other. They eclipse all others. It was not really favoritism but it just happened that the owners of the minds in question knew how to make the best of them, and they did. Vice-President Coolidge's share in these meetings was quite colorless. He preferred being a good listener and he listened. He was Vice-President, the second most important man in the country, made so by popular vote and direct mandate, in comparison to whom the others occupied jobs at the will of the employing power and no more.

No one could take the Vice-Presidency away from Mr. Coolidge; the others could lose their jobs at a moment's notice. Mr. Coolidge was the people's choice; the others were the President's choice. He was in actuality the only national official excepting the President himself; the others were conditional officials in whom the electorate had no direct interest.

It is a picture worth conjuring, that of Vice-President Coolidge sitting with the Cabinet, but unsure of his standing, a guest but practically an outsider, weighted down by the prejudice that his office is a sure road to obscurity (which it is not, as he and Roosevelt have demonstrated). He could not speak for the Senate, of which he was the voiceless President, nor had he any official standing in his new environment except by courtesy. Could he have been more of an outsider in spite of Warren G. Harding's kindliness and oftentimes chuckling humor?

That picture, once formulated in one's inner eye, will easily show a lack of juxtaposition that could not have been without some sort of psychological effect.

A comparison has been hinted at between Roosevelt's case and his. But the comparison is technical. Nothing else really resembles. The spirit of McKinley was much less potent in 1901 than that of Harding in 1923, with respect to interparty interests. Moreover, Roosevelt was squelched into the Vice-Presidency to preclude his presidential aspirations, of which machine politicians of the time did not approve, whereas Coolidge was tendered a bee right after the "law and order" days of the Massachusetts police strike, but that bee was a drone which underwent the fate of any drone in well-regulated hives.

It was not difficult for President Roosevelt to sponsor the McKinley idea because it was of the open-stock variety, made so by the times and inclination. McKinley, moreover, was more secure in his position than was Harding, because the former had already been endorsed by the people with a second term. There was no contesting political shadow hovering over that administration as there is over the present one. Cleveland, the only living ex-President, his successor-predecessor, Harrison, having died earlier that year, was no longer a political power.

Everything was lovely in those days; except for the Buffalo tragedy it could not have been lovelier, and Theodore Roosevelt was not unsafe in bonding himself as he did because he was quite free to do as he pleased—which he did. Today the unfinished business carrying the Harding label is endless; attempting to handle it upon the basis of that label will not leave President Coolidge much leeway.

Yet this seems somehow expected of him. The fact that Wall Street came through without a shock is due, it is alleged, to the promptness with which the new man effaced himself. But has everybody been heard from? Hardly.

At the time of writing, the most important part of the country had yet to be heard from and no indication had forthcome as to the time and manner word might be expected.

The opposition will ask nothing better, of course, than that the policies originally sponsored shall be the order of day for days to come. It will make it less laborious for them to enter the campaign, because any new or different undertakings by the new Executive more than likely would disarrange and possibly even make useless their plans.

But there is no reliable sign that President Coolidge must offer himself as a sacrifice to the great moloch of politics. Who will admit that he was selected in 1920 because the death of his team-mate would mean the relative death of Calvin Coolidge too? Who has surcharged the air with the suggestion that he commit political harikari in order to perpetuate the late administration cognominally?

Has it been realized that too much politics is being played on the memory of Harding and on the obliteration of Coolidge?

President Coolidge should be free to carry out his work in accordance with his judgment, no more and no less, irrespective of former or subsequent sentimentality. He alone, as the new head of the Republican Party, can determine what must be done first for the nation and second for the party. Constitutionally, he owes nothing to the immediate past, nor should he be jockeyed into corners where he does not belong. It is very easy for those interested to plead a maudlin excuse.

The whole country wishes him the best of success, but that should be wished in his own right and in no other way.

Calvin Coolidge is not Acting President of the United States.

Calvin Coolidge is President of the United States.

The people expect to hear from Calvin Coolidge himself. Being Calvin Coolidge is a part that he can play perfectly; merging himself into something different will be the beginning of another story.

The Honest, Care-free Folk of Casco Isles

Concluded from page 3

markings, near the Punch Bowl, had been moved.

In earlier years Captain Kidd and Dixy Bull are both reported to have concealed treasure on Jewell. Dixy Bull is Casco Bay's own pirate. He was a young man of good family, but being captured by the French and losing a valuable cargo, he turned pirate himself with several other young gentlemen of similar misfortunes. Not being to the manner born, these amateur pirates are credited with having suffered terrible remorse of conscience so that "they were filled with such fear and horrour that they were afraid of the very rattling of the ropes." But they harassed the Bay for several years until Dixy Bull was lost at sea on his way to Virginia. Across from Jewell is Cliff, a very picturesque island. Here lived, it is said, one Kieff, a nefarious partner of "old man Chase" and the two on stormy nights would, according to the story, light fires along the rocks to lure vessels to their ruin.

Near Cliff is Long, one of the most beautiful and popular of the islands. Just below is Hope, owned until recently by Senator George W. Elkins, of Philadelphia, and farther down is the group of islands which belonged to the late Admiral Peary, discoverer of the North Pole. His family still makes Eagle its summer home. For a while his Eskimo dogs were on Flag, but they made themselves too troublesome by swimming across the Bay to Harpswell and killing sheep and other small live stock.

On Long as on many of the islands, are great heaps of clam shells, crumbling to dust. These and a few Indian names as Chebeague and Bomazeen, are the only memorials on the islands of the tribes who used to frequent them. In summer, from the territory round about they came, using the beaches and streams as highways. The main streets of Brunswick, at the farther end of the Bay, are old Indian carrying-places where canoes and equipment were lugged from stream to shore. All summer they camped together on the islands, fishing and digging clams and drying them for the winter. They called the bay Aucocisco, meaning gray heron for these beautiful birds abounded, but the name was too long for the white man, who shortened it to Casco.

The last Indian to keep the lonely tryst was Mingo, who continued to come every year to Bailey's. He died upon the island, as was his wish, and good Deacon Timothy Bailey saw that he was buried in his favorite haunt, called, since that time, Mingo's Garden. For many years Clara Louise Burnham, the writer so beloved by girls has made her summer home on Bailey's.

Next to Bailey's is Orr's, the most storied of all the islands. Here Harriet Beecher Stowe lived one summer, collecting material for and writing the first chapters of "The Pearl of Orr's Island." The house is still in possession of the descendants of the family with whom she lived, and visitors are shown the familiar household objects mentioned in the book, as well as actual photographs of the characters who were taken from the folk of the island. The grotto where the children played, the cave where Mara followed Moses and the smugglers, the Kittredge house, and many other landmarks all remain just as "the book," as they call it on the island, describes them. Not far away is Elm Island, the scene of Elijah Kellogg's stories for boys. A bridge connects Orr's with Harpswell, that charming little village on the mainland which has more sea line to its credit than any state on the Atlantic Coast except Maine.

To Longfellow, they were the Hesperides of youth, and Whittier loved their changing beauty. They are the theme of many of his poems and doubtless the inspiration of the tender lines,

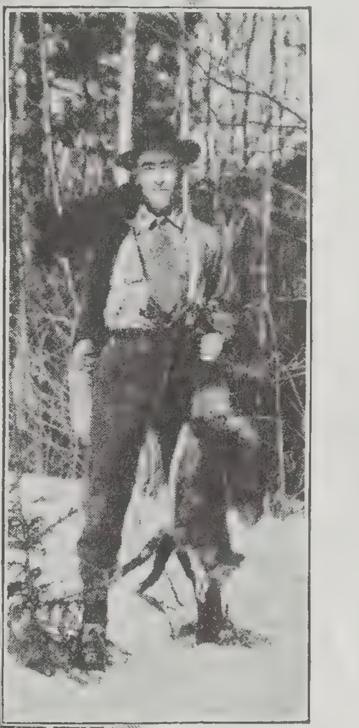
> "I know not where His islands
> Lift their fronded palms in air;
> I only know I cannot drift
> Beyond His love and care."

The Cruelties of Trapping

Eighty Per Cent of Furs That Are Taken Come From Animal-victims of Professional Trappers

By JOHN DAVIS ANDERSON

Wolverine captured in a trap and frozen when found.



Above—Opossum caught in a trap. At right—Trapper with fox just captured.

SOME months ago a fur dealer in New York, as an advertisement, released a live red fox on Fifth Avenue. A protest went up from every animal-loving person in the country. The fellow who did this exceedingly cruel thing was arrested and heavily fined. Nobody felt sorrow for him nor would regret have been expressed had he been sent to jail for his misdeed.

It did not appear that the fox released in the midst of traffic suffered any special torture—nothing more serious than an injury to one of its paws by the wheels of a passing taxicab, but nevertheless indignation ran high. The incident was a public one and the newspapers front-paged it for several days.

At the very hour when this fox was released there were thousands, yes, tens of thousands, of steel traps cunningly concealed and in wait for the paws of wild animals, and once caught who can recount the torture of the animals so trapped and of their miserable fate because they had been captured!

There are two kinds of traps which are used in taking fur-bearing animals. In one the animal is killed nearly instantaneously. A good example is the deadfall, known of the Indians, and today used in taking some of the larger animals. It is seldom used in capturing the mink, skunk, muskrat, wolverine, opossum, hare, ermine, squirrel or other small fur-bearing mammals.

A very large part of the animals—perhaps 80 per cent—which are taken in traps represents the work of professional trappers. The country boy and the amateur take but comparatively few. It is against many practices of the professional that animal-loving persons revolt. Usually the trapper will start out with perhaps a hundred traps. Before he has placed them all in favorable locations he has covered 50 or 60 miles and it may be three or four days before he will return to put to death the animals his traps have captured.

We must all realize that there are tragedies of the forest; that natural life there is no less cruel than the fur hunter.

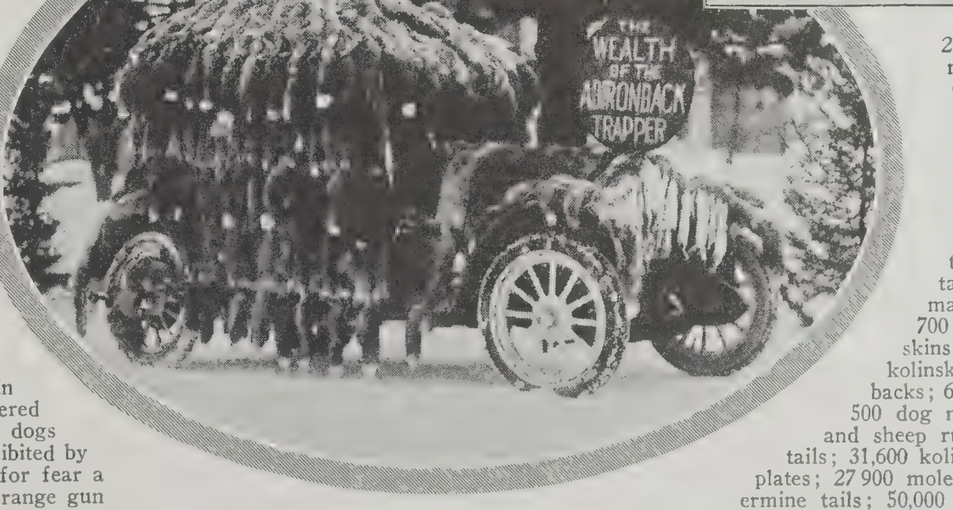
"There is no such thing as a natural death in the wilds," says Agnes C. Laut. "The rabbits fall victims to the weasel, to the wolf, to the bear, to the lynx, to the marten; and if they didn't they would and do multiply with such terrific rapidity that they would and do fall victims to a pest of disease once in six or seven years. Otherwise, they would do what they have done in Australia—become so prolific they perish of starvation. Each creature in the animal world preys on the creature one degree smaller or weaker than itself. That failing, they eat their own young, like rats, or disembowel their mates as the wolves and minks do. The fur trader's prosperity being dependent on the continuance of fur life, his buyer will only buy furs taken prime, that is, in the short season of two or three months when the fur is perfect, when the mothers are not bearing young, and when the young are full grown, taken by such forms of trapping as do not fever the animal with needless pain, for a fevered animal turns bluish in its skin and a bluish skin sheds its hairs just as a fevered human patient loses his hair. Hunting with dogs is discouraged and in many fur districts prohibited by law. Poisoned bait is also being prohibited, for fear a mother with young should get it. The long-range gun or rifle is a less painful death than to be slowly eaten by a wolf, or to have the blood sucked out alive by a mink or a marten, but the present tendency is to use only the rifle for such big dangerous game as wolf or bear, and use box traps or deadfalls, which kill instantly, for fox, fisher, marten."

But this leaves the steel trap as nearly the sole means for capturing the smaller animals. This inhuman invention is the most efficient for the purpose to which it is put. A large animal caught in a steel trap suffers more than a small one because it does not so soon die.

Trapped animals are frequently dead when found. The three principal causes of death are starvation, fever induced by pain and suffering, and by freezing. If they still survive they are clubbed or shot to death. You see that catching animals by means of this type of trap can be only cruel business. But this is not all. At least one animal in every four taken is worthless as far as fur is concerned. Also domestic cats and dogs are frequently so captured, but the suffering is none the less intense.

Animals, of course, frequently have their legs broken with the first snap of the trap. In such a case almost invariably the creature will bite or twist off the leg and go free. It is no unusual thing to trap an animal which has but three legs, showing how narrowly it escaped death but not some measure of torture on some previous occasion.

Most states have incorporated into their trapping laws a provision that traps shall be visited daily but the provision is physically incapable of observance. A long line of traps cannot be visited daily in the season when trapping is at its best—the dead of winter—and when storms of great severity are common. We know, too, that when a sufficient price is put upon the pelt of any animal, it is only a question of time before extermination takes place.



A load of fox skins taken by one trapper in the Adirondacks.

Dr. William T. Hornaday says that fur-bearing animals are in a worse plight—more nearly exterminated—than were the birds 25 years ago when various societies "joined in the great crusade against the milliners which has resulted triumphantly in restoring the birds to America and aiding, at least, in the preservation of birds throughout the world."

Unless immediate steps are taken it is reasonable to believe that the fur-bearing animals of the world at large are doomed.

Professor Henry Fairfield Osborn says that the last chapter of the Age of Mammals is now being written in blood and the end of the period of mammalian life is at hand. In all probability the next 30 years will see the utter extermination of such animals as the beaver, and all this despite the claim made that the existence of the fur trade depends on protecting wild life and conserving the fur bearers. About the only regions where fur-bearing animals remain are Alaska, Northern Canada, Siberia and parts of the United States.

If there are persons who think that these regions can keep on producing fur at the rate they have they are much mistaken. Recently the following numbers and species of animal skins were exposed for sale in a single week in St. Louis, the principal fur market of North America: 730,000 skunk; 333,500 muskrat; 364,000 opossum; 21,000 raccoon; 65,400 cat, civet; 96,000 mink; 1,500 fox, silver; 2,100 fox, cross; 4,800 bear; 11,000 opossum, ring-tail; 189,000 wallaby; 2,000 chinchilla; 400,000 squirrel; 210,000 ermine; 6,500 marten; 2,800 sable, Russian; 250 baum marten; 3,500 stone marten; 30,000 wolf; 4,000 cat, wild; 25,000 cat, house; 9,700 badger; 450 fur seal, dry; 420 fur seal, dyed; 5,029 hair seal, dry; 155,000 red fox, Australian; 10,500 fox, Japanese; 1,500 moufflon; 2,400 leopard; 70,000 fox, red; 16,000 fox, white; 705 fox, blue; 15,000 fox, gray; 65,000 fox, kitt; 9,000 beaver; 4,610 otter; 980 lynx; 305 wolverine; 2,600 fisher; 10 sea otter; 55,000 marmot; 131,000 hare, white; 70,000 nutria; 47,000 lamb, Thibet; 800 lamb Thibet robes; 25,000 slink crosses; 8,000 slink skins; 625,000 Chinese rabbits; 5,890 white rabbits; 33,000 kid crosses; 160,000 kid crosses skins; 10,500 Persian lamb; 105,000 goat skins; 29,000 goat rugs; 160,000 opossum, Australian; 3,100 fox, dyed; 3,000 fox tails; 4,363 fox, white paws; 4,300 marten tails; 6,000 muskrat skins; 700 muskrat strips; 39,000 rabbit elec. skins; 3,200 rabbit elec. strips; 13,500 kolinsky; 8,500 fitch; 26,500 squirrel backs; 600 squirrel sacs; 500,000 mole; 12,500 dog mats; 4,000 dog skins; 6,800 deer and sheep rugs; 1,200 hare, dyed; 1,150 fitch tails; 31,600 kolinsky tails; 19,000 lamb; 700 mole plates; 27 900 mole cony; 1,000 hamster sacs; 11,600 ermine tails; 50,000 rabbits, dressed; 1,100 broadtails, dyed; 7,000 pounds squirrel tails.

Miss Laut believes that the raising of fur-bearing animals—fur farming—is a solution for the future production of fur. Dr. Hornaday does not agree with this position. While much has been written on the subject and what has been written has, generally speaking, attracted wide attention by reason of the enormous prices frequently paid for animals for breeding purposes, he sizes up the whole situation in a very few words: "We have hoped for the success of these efforts until hope seems to be in vain. One by one the fox, skunk, mink and marten have been tried, and the efforts with black, cross, red and blue foxes have been partially successful.

"Very few black foxes have ever been killed for their fur. Some dealers say that fur raised on fox farms is not popular in the fur trade because it lacks the brilliant luster of the wild fur, and therefore must sell accordingly. The fur farmers who have tried skunks, mink and marten have encountered a long series of obstacles and discouragements, based chiefly upon the temperamental idiosyncrasies of the animals."

'Camp That Came From Nowhere in No Time'

Concluded from page 9

suddenly on a desert having accommodations for no one, all sorts of makeshift shelters were contrived. We often went exploring in the dugouts which lined the foothills where men had burrowed for a place to sleep in the days when many walked the streets all night, or slept packed close on the floor of a saloon, or paid a fabulous price for a bed from dark till midnight, or from midnight till dawn, for the beds were run like the mines—two shifts nightly.

Necessity being the mother of invention, those little shacks were interesting studies in architecture. A packing box for the four walls with a canvas roof was a favored style, while a home built entirely of beer bottles and adobe mud remained to be pointed out as the most interesting pioneer building in camp. A town enjoys a certain advantage in having its buildings compact and easy to handle, as was evidenced by this sentence published in the *Daily Tribune* after a fire had broken out:

"For a time there was danger that the conflagration would become general, but willing hands soon bore adjoining structures to places of safety."

Exteriors might of necessity be rough, argued one bachelor owner, but beauty should reign within. So with a touch of ironic humor, he papered his four walls with worthless mining stock—all hope of redeeming it having passed—and figured that thereby he had realized something on an investment that had threatened to be a total loss.

The same means of interior decorating might have been fittingly used in many more pretentious homes, for the lean days were upon the camp by 1912. The flow of gold which had been like a mighty stream five years before, was now but the merest trickle. Rich veins were exhausted. Huge sums had been spent in the development of what proved to be blind strikes. But the Goldfield folks, as I knew them, and loved them, were a brave, gay people who laughed misfortune away and declared, "It's all in the game." If the man who carelessly tossed the newsboy a twenty-dollar gold piece for a paper in 1906, and refused the change with a lordly gesture, had hard work to pay the grocer in 1912, why the joke was on him! and if, perchance, the same newsboy had happened to invest these easily acquired twenties in a soaring stock, and now posed as one of the town's plutocrats, the man still had a smile for the vagaries of fortune.

For gold plays many a freakish prank with those who pursue her. On the poor she may heap riches. From the rich she may take all. Many names flared from obscurity into sudden prominence when Goldfield appeared on the mining horizon. The stories surrounding them read like pages from a new Arabian Nights and our ears were always eager for their telling.

Fortunes Came Quickly

ONE concerned George Wingfield, whom we often saw in Goldfield, though his home was now in Reno. He was the son of a Nevada cattleman and enjoyed the reputation about Reno for uncanny luck at the gaming table and enviable expertness of aim with a gun. Still in his twenties, and broke, when the hue-and-cry arose, he joined the gold-mad throng and located some claims in the new camp. Having no funds for development, he appealed to Senator Nixon, who had a fondness for the youth, and the Senator loaned him money without security, for a start. In three years' time, Wingfield had taken out $15,000,000. It was said of him that he never forgot a friend, nor forgave an enemy, and his first move when he saw that he had struck it rich was to offer Senator Nixon a partnership. They built the Nixon Block, which housed the first Stock Exchange.

Driving out on the road to Tonopah one day, we came to the little camp of Diamondfield, and our host related the story of J. L. Davis—"Diamondfield-Jack" as he was known to us. He had wandered down from Idaho, with a burro and a month's supply of food, donated by a kind-hearted friend, as his only assets. History does not record whether it was Jack or the burro who smelled the precious metal—or perhaps they carried an extra horseshoe tucked away in the outfit—but at any rate, they stopped for a night's camp right over one of the richest veins opened in the Goldfield district—and presto!—Davis was a millionaire!

There were other instances—January Jones; and Henry Weber, who came into camp as the guest of the unknowing T. and G. railroad in a freight-car-truck Pullman, and sold his interest in the Great Bend Extension a year later for $1,250,000.

On the other hand....., a society woman of Denver our landlady had been. She cooked our meals with no apology nor complaint of conditions to which fickle fortune had brought her. She and her husband embellished our dinners with camp legends told with a brightness and charm that often kept us at the table far into the evening; for they had been among the first arrivals, waiting with crowds at Tonopah for the stage seats that were engaged days ahead; fighting with others that severe winter for coal at eighty dollars a ton or wood at sixty dollars a cord; living through the scourge of pneumonia, which took a heavy toll because of crowded conditions and inadequate shelter; seeing their money go into stock of mines which failed to prove out; and now, in straitened circumstances, laughing their way along with merry quip and jest.

The quest for gold brings together all classes of people. An abundance of money in a town always means, of course, the presence there of gamblers, soldiers of fortune, crooked promoters, swindlers of all sorts; but with them come, too, the keen brains of science and education. Probably few towns in the East could boast so high a percentage of cultured, traveled folk as Goldfield. Hardly a great university of the country but was represented in the group of mining engineers, chemists, metallurgists and teachers; for Goldfield proudly paid the highest salaries in these lines of any place in the United States, and therefore felt justified in demanding high qualifications.

An interesting figure seen occasionally on our streets was that of "Death Valley Scotty." After years of fruitless prospecting, he had unearthed gold and glory in that famous sunken desert of the West, where the bleaching bones of many seekers of an El Dorado lay on the sand above the treasure they sought. There were stories of Scotty's glad ride along Michigan avenue in Chicago, tossing five-dollar gold pieces right and left; and hints that he and his wife, after years of frugal life in the open, were not altogether at ease with wealth in a Los Angeles mansion.

A large divorce colony, with headquarters at The Goldfield, provided a bit of color in the mosaic of life here, and spared the lawyers of the camp, incidentally, much worry as to sources of income. Splendid hotel accommodations, and a seclusion impossible at Reno, accounted for the presence of so many in Goldfield. Nat Goodwin, sojourning in camp while getting his much-wrecked boat in trim for another sail on matrimonial waters, became greatly enamored with Goldfield, and was loath to leave after six months, when his lawyer announced that everything was shipshape.

The Life of Goldfield

LIFE was lived with a zest in Goldfield. Perhaps it was the altitude (7,000 feet above sea level). Mining stocks might go down—and off—the boards, but every day was play day after working hours. Few amusement companies, from the outside, risked the expense of the two-hundred-mile trip down from Reno, for the fare at this time on Nevada railroads was nine cents a mile; but the camp's ingenuity could always provide a good time on short notice.

We danced and bridged and rode and hiked. The dancing parties bore no resemblance to the proverbial mining camp "hoe-down." Often a profusion of flowers and greenery would be imported from Los Angeles, at prodigious expense, costly favors provided, and there would be Paris gowns and beautiful jewels. The Chuckawalla Club, named for a mythical little creature of the desert, its membership drawn from the gay young blades about town, staged parties as perfect in appointments as some of the famed college "hops."

But it was to the great out-of-doors that we turned most often for sports. In the first homesick days, the landscape offered nothing but sand and bleak hills. Just when the beauty of the desert began to speak to us, it would be hard to say; but suddenly the sand was a lovely stretch of softly glowing, ever-changing colors; and the hills, no longer bleak and bare, were alive with the misty purples of sage and greasewood and mesquite. The somber old Malaipi Mountain, surrounding the camp on three sides, called a constant challenge to climb and explore. We cooked our suppers in its deep canyons, and clambered to the top for the unsurpassed beauty of a desert sunset, and a desert starlit sky—with the twisted "Joshua Palms" the desert cactus tree, like ghostly misshapen sentinels below.

One winter's morning when a light fall of snow—a rarity in Goldfield—had made the tracking of game seem more appropriate than picnicking, we took the trusty "22" and stalked the wily coyote over slippery rocks and down steep mountain sides. Looking back on it now, the fact that the coyotes escaped unharmed is less surprising than that the hunting party came home alive, for we were mostly in the tenderfoot class.

On the outskirts of the town lay the mines—the Mohawk, Jumbo, Sandstorm, Red-top, Clermont, Combination—names that had been on the tongue of a nation. Many of them, their brief day of glory past, were now worked out and deserted. Through the courtesy of mine officials, we made interesting trips down in those still producing. One of these began with a descent to the lower levels of a mine near the camp, then a three-mile walk underground, at the heels of an expert guide, to the workings of the Consolidated's plant, where we emerged into daylight for a tour of their noted mill. Here the gold was being separated from the ore by the new cyanide process which had meant a saving of millions to the country's gold production. They told us, I remember, that had this process been known when the Comstock Lode was being worked, $50,000,000 more might have been realized from those mines.

The two stages in the manufacture of gold that I could comprehend and most appreciate were those where the identity of the metal was unmistakable. In the ore, or in chemical solution, it did not look the part; but piled at the finish of the milling process in yellow cakes, bona fide "gold bricks," ready for shipment, under heavy guard, to the mint at Denver, or passed out in shining eagles from the cashier's cage of the John S. Cook and Company's bank, at the end of a school month, I could offer the homage due it as one of the most powerful factors in the lives of all men, of all times and places.

Need New "Strike" of Gold

WITH almost forgotten memories of those gay days vividly recalled by news of the recent fire which destroyed Goldfield, it is hard to realize that the same John S. Cook and Company's bank is one of the few buildings left standing in the camp; the imagination finds it a sad task to picture the desolation of that scene.

Dispatches from San Francisco papers assert that the indomitable Goldfield spirit is planning to rebuild; but the justification for a town there went with the gold. Without the discovery of new veins of ore, or the building of some stupendous system of irrigation so that the desert could be developed agriculturally, it hardly seems possible that Goldfield can live again. It has come "to the end of the rainbow." As an editorial in a Chicago *Tribune* of recent issue puts it:

"After all, how does the life of a community differ from the lives of its individuals? Man and city alike follow the rainbow. The joy and the justification is in the pursuit. Goldfield gloried in its day, and is glorious in its memories as it sinks to ashes. The coyotes were howling when it was born, and howl as it dies. But theirs is not a howl of triumph, but of desolation. They survive but do not gloat. The life of city and of man must justify themselves. Those who sought the rainbow and observed its end in Goldfield will attest that as a fact."

And What a Best It's Been These Sixteen Years

Concluded from page 7

go to a pennant-winning team and play in a world's series, I'd rather stay right here with my old team."

Never farmed out, never sent back for more experience, Johnson's career is equaled by few if any pitchers in the big leagues.

"How did you come to escape the pitfalls of the night life?" I asked.

"Well, as a kid I just never took to it some way. In Weiser about every other business place was a saloon, but the sports of the town always told me to take care of myself and leave liquor and cards alone. Then, after I came to Washington, I noticed that the fellows who played the liquor and bright lights were 'dopey' on the diamond next day, had slumps and all that, and yet they were fine fellows. They seemed to want to see me make good and they always advised me to 'lay off the rough stuff.' I followed their advice—some of the very chaps who ruined their game by their habits.

"Reputation has a lot to do with a man's success, I figure. I had a friend who liked to visit summer gardens, listen to the music and drink beer. I went out with him a few times, but I drank ginger ale. I had not been out with him more than half a dozen times until word reached the manager of the club that 'that young Johnson is playing the night life.' So I saw I couldn't even keep the company or visit the beer gardens without getting a bad reputation. I took to staying in my hotel and reading a lot."

And through this incident Johnson won his wife, for it was at the Dewey Hotel, where he lived that he met Hazel Roberts, daughter of the then Representative to Congress from Nevada, E. E. Roberts, who lived with his family in the same hostelry.

With his record of sixteen years on the same club, 100 shut-out games, more than 3,020 strike-outs, 346 or more games won and 200 odd lost, it matters not whether Walter Johnson is being batted out of the box—which sometimes does happen—or whether the "break" is with him and he is striking out every batter, the fans cheer him just the same. It is his clean living, his quiet, gentlemanly demeanor on and off the diamond, his manifest fairness to players and umpires, and, above all, his effort to give the fans the best there is in him that make him so popular whether he is winning or losing at home or abroad.

"A fellow's got to have a clear head and plenty of reserve power if he is to match wits with the batters and pull himself out of a tight hole," says Johnson, "and going to bed early and taking care of yourself gives you that."

"Do you believe clean living and square playing have been more responsible for your success and the way the fans treat you than anything else?" I asked.

"Yes," he replied, "that must be it."

Crooked baseball games, in this day of commercialization of the sport, have been played—witness the White Sox—but it is safe to say Walter Johnson never knowingly pitched a ball in a crooked game. He simply isn't that kind of man.

So, while all over America every boy who possesses a baseball, a bat or a glove, worships at the shrine of Walter Johnson, reads avidly every line printed about him, knows his record, and aspires to emulate him, parents need not worry, for the more intimately each boy comes to know the celebrated hurler's characteristics and habits, the better will be the effect on the sport-loving youth of the country.

"What was the greatest game you ever played?" I queried.

"Well, I don't know what was the greatest game. But I think the best game I ever pitched was some years ago in Boston when Ray Collins, left-handed pitcher, was pitted against me. The game went fifteen innings. In the ninth the bases were full and not a man out. I was in a tight hole, but I got a 'break' and won 1 to 0."

A next-door neighbor of Johnson is a minister, pastor of one of the most fashionable churches in Washington. When I was about to move into the neighborhood I had a talk with him. "It is a very select section," he told me. "One of your neighbors will be Walter Johnson—a great man." I was somewhat surprised at the minister's evident admiration for the baseball star.

But later I learned the reason, for I came to know Walter Johnson in his home, and the minister was right.

Perhaps of all the affectionate sobriquets the fans have applied to Johnson, the most familiar is that of "the Big Train." Some day when you have an opportunity to see the Washington club play and you see "the Big Train" step into the "bull pen" and begin to steam up, you may rest assured that with anything like an even "break," when he pulls upon to the mound there will be some "smoke" go streaking across the plate.

Driving Poison From the Nation's Food

Great Progress Made in Science's Efforts to Stamp Out Botulism

FOR MANY years persons who became ill after eating have ascribed the trouble to ptomaine poisoning. Especially has this been the explanation for illnesses following the eating of canned goods.

We were formerly under the impression that we were poisoned by germs in the tin or solder in receptacles containing food, but scientists have proved these alleged causes fallacies. Years of research discloses that the poison has been in the food itself, provided any poison was present at all.

The question of food poisoning has become an important one in the past few years. Scientific commissions have been studying it and have made various reports. All agree that where poison does exist, it is not in the materials that form containers in which goods are packed, but that it is in the goods themselves. They further declare that the poison is in the soil in which the food is produced.

A commission to investigate food poisoning was appointed to make a careful investigation following outbreaks of ripe olive poisoning in Detroit, Michigan, and Canton, Ohio. These outbreaks caused several deaths and virtually ruined the ripe olive industry of California, causing a loss to growers of $30,000,000.

The commission consisted of Dr. J. C. Geiger, epidemiologist, appointed by the United States Public Health Service; Dr. E. C. Dickson, of the Leland Stanford University, and Dr. K. F. Meyer, of the University of California. The commission collected soil from all corners of the earth and subjected it to rigid tests. The investigation consumed nearly three years, and the reports on what was discovered now are in the hands of the United States Government. They probably will be published in pamphlet form shortly.

Dr. Geiger now is a member of the staff of the bacteriological department of the University of Chicago.

Dr. Geiger recently discussed the work of this commission and announced some of its findings. He spoke of food poisoning in general.

"Ptomaine poisoning isn't a bad term," he said, "but it has been covering a multitude of ills. The term has been used for centuries, and the deaths of persons who died from appendicitis, cancer and other ailments have been ascribed to it, but we are now getting the facts in food poisoning, so-called, and the public will shortly be more enlightened.

"At the same time, we have discovered methods of preventing such poisoning, of which there hasn't been a great deal, considering the number of deaths from other causes each year.

"The ripe olive poisoning cases were spectacular, therefore the attention of the whole nation was drawn to them. People were afraid to eat any sort of canned goods, but their fears have been mostly groundless.

"As most people now know, botulinus was the poison in the ripe olives. The germs were not in the material of which the containers were made, but in the olives themselves.

"Botulinus is a deadly poison, but we have proved that the spores and germs can be killed; in fact, the methods recommended by the commission are killing them, and now we have very few cases of this kind of poisoning.

Dr. Geiger was asked how long the botulinus germ had been known.

"It was isolated in Germany in the eighteenth century," he said. "The Germans used to slaughter their hogs each fall, and make sausage of some of the meat. People who had partaken of the sausage became ill, and studies disclosed that those who had eaten only the outside of the sausage were not affected. Those who had eaten all the way through became ill. This revealed that the germs near the outside of the sausage had been killed by the heat to which it was subjected. The heat, however, was not sufficiently intense to kill the germs further into the sausage. That is the exact principle with canned foods, olives or anything else, today.

"The heat must be sufficient to penetrate all the way through, and it is to that that commercial canners are giving attention today."

The commission of which Dr. Geiger was a member proved conclusively that the botulinus germ is found in greatest abundance in soil that has never been cultivated, especially in high altitudes, from whence the germ is washed down into valleys where the soil is cultivated.

The results obtained by the commission demonstrate that the organism is practically always present where fruit and vegetables are grown, but proper sterilization, which canners now are exercising, according to Dr. Geiger, kills it.

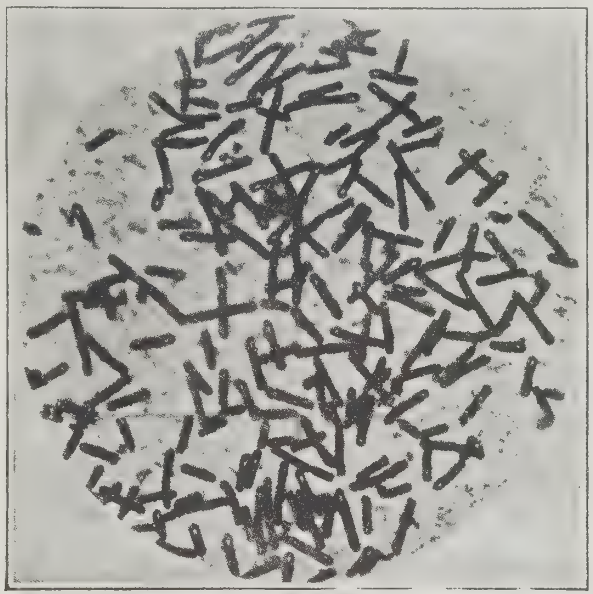
Dr. Geiger said that home canners should subject the goods they put up to the same boiling temperature commercial canners use if they are to be certain that the germ is killed.

He declared that the germ is hardest killed in spinach, string beans and ripe olives, because it is difficult for heat to penetrate these foods. Besides, he said, string beans are quite dirty when they come from the soil and require careful cleansing in addition to more heat than other vegetables or fruit, with the exception of ripe olives and spinach, which also require extreme heat.

"In connection with investigations of food poisoning cases which have been made in the past few years, one very important point is generally overlooked by attending physicians or health officers," said Dr. Geiger, "and that is the necessity of confirming clinical findings by laboratory on tests of samples of suspected food. Without such data the record of such outbreaks is of little value, either as indicating the real cause of the trouble, or suggesting how such outbreaks may be avoided in the future.

"Many outbreaks illustrate the fact that the term 'ptomaine poison' has been very loosely used in the past, and in defending these cases not enough attention has been given to the exact type of the illness and its relations to the suspected food, both as to the manner in which the food itself was prepared and handled, and the time within which the illness developed. In most of the so-called ptomaine poisoning claims it is necessary to contend with the doctors diagnosing the illness and attributing it to some suspected food, making no test of the food itself, nor do they acquire a very accurate history of the patient's illness, or try to eliminate other factors which might have caused it.

"Food poisoning in general must have been with us always," continued Dr. Geiger, "though the extent is only comparable to our knowledge of the subject, which is meager to say the least. We can recall our ancient history of the food taster to the king. It may be expedient to recall that the act of tasting has been the cause of many deaths from botulism in the housewife, presumably testing its safety."



—Courtesy *The London Graphic.*
What the botulism bacillus looks like.

Dr. Geiger was asked how foods act as poison and harmful agents. He enumerated thus:

"Poisoning in itself, such as the so-called mushroom poisoning.

"Because of growth of organisms with which it has been contaminated either in nature or in its preparation. This is botulism.

"Then there is the para-typhoid group. This is caused because the food may originate from a dangerous source, parasitic disease, anthrax, tuberculosis, idiosyncrasies, or the faulty preparation of elimination of normal substances usually present.

"Of these botulism, because of the spectacular and usually fatal outbreaks, can easily be said to lead the list. It has been shown, however, that the annual number of deaths from botulism is very small, averaging in the last ten years less than twenty-five a year, but more than 110 outbreaks in humans have occurred, of which only forty-one have been proved bacteriologically.

"Sanitation by thorough cleansing, proper storage and the use of fresh products to be canned is primarily essential as a protecton against botulinus spoilage, and then the proper boiling temperature for the different altitudes."

Dr. Geiger said that regarding the treatment of the poison, substantial progress has been made in learning the specific nature of the illness and the manner in which the poison acts. He declared, however, that unfortunately no progress has been made in giving relief to patients. Antiseras have been prepared by which botulism may be prevented in animals when treatment is given immediately after the poisonous food has been consumed.

"Unfortunately again," he said, "there has been no opportunity to use these cures with human beings until after the symptoms of the disease have appeared and it was then too late."

But Dr. Geiger is hopeful that the deaths, few as they are, can be reduced when scientists finish their researches.

Reverting to food poisoning in general, Dr. Geiger said that of 147 outbreaks of such poisoning, due to almost every variety of food and every source, manufacture and distribution, there was no evidence in 113 and that the fact pointed to other diseases and conditions. These outbreaks involved 1,578 persons, that is, the number of persons claimed to have been made actually ill by the consumption of material as food. Of this number there were eighty-five deaths.

"Here is an illustration of a so-called food poisoning outbreak," resumed Dr. Geiger. "Recently in Erie, Pennsylvania, three persons became ill, apparently from eating home-prepared bacon. One death occurred. The fatal case was a paralytic with marked arteriosclerosis. It is not unlikely that such symptoms attributed to food poisoning may prove fatal in such a case.

"Rightfully assuming that many deaths are due to other causes than food poisoning, or botulinus intoxication, the fact that only in four instances were autopsies performed makes these statistics almost valueless. It is more important to state that in every autopsy performed the results were definite, and in three the original diagnoses were completely refuted or changed. In any event the almost complete lack of laboratory examination on either the food or the patient offers important evidence of a public health situation that at the best is deplorable."

Dr. Geiger said food put up by commercial canners in the past two years is perfectly safe and free from any form of poison, due to canners following the recommendations of scientific commissions.

Commercial canners pack and market approximately 4,000,000,000 cans of food a year, the value being nearly $1,000,000,000.

"Was Jesus Christ a Jew?"—An Inquiry

Concluded from page 6

The whole trouble in Palestine today is that the Jews again want to take the land from the Arabs who have lived there for two thousand years. The people of Israel were to be planted in a place of their own, "and move no more."

Now, as Israel was not Judah, it is useless to look for the fulfillment of Israel's destiny in the Jews and as a matter of fact the Jews have not fulfilled it and cannot. To look at the Jew for proof of the Scriptures is to look in the wrong direction; the Scriptures in their common acceptation stand or fall on the proof of Israel. This proof is not offered here; the reader is only cautioned against falling into the error of confusing the destiny of Israel with that of Judah. The two are never confused in the Bible.

It was over Israel that the House of David was to be established. In Scripture history the last we see of the House of David is in the persons of "the king's daughters" being rescued by Jeremiah during the awful end of the Judean government, and being borne away by him toward the sea. They appear again in legend in what were called variously "the isles of the west," "the tin islands" and "the Britannic Islands." There is a strong contention that the Hill of Tara in Ireland is really the Hill of the Torah (the Law) and that the word British is a compound of two Hebrew words—"berith" or "b'rith," meaning covenant, and "ish" meaning man. At any rate, the early appearance of the prophet Jeremiah in Irish legendary lore has never been explained nor explained away.

It is certain, however, that the House of David as officially established was removed from those whom we now know as Jews and was set up, if anywhere on earth, over Israel. The mistake made with reference to Israel, of course, is to seek out some bizarre, outlandish "lost tribes" in Abyssinia or Asia, instead of taking the earmarks of Israel as given in the prophecies and seeking to discover what modern empires and nations, if any, may seem to bear them.

To regard Jesus as "son of David" in fleshly inheritance is not therefore to prove that he was Jewish. Indeed there appear in Jesus' physical ancestry three complete aliens from Israel, the two who are found in David's ancestry and the one which David added when he took Bathsheba who became the mother of Solomon. It is rather notable how the alien strain makes itself known in Judah through superior individuals. In any case, as "son of David" Jesus was in the Israel line instead of the Judah line with reference to the kingship.

But here is the principal fact regarding the significance of "the son of David" as applied to Jesus—*Jesus did not himself fully accept it.* The Davidic descent is not denied, but its implications are questioned by Him. The passage is important enough to have found record in three of the Gospels.

"While the Pharisees were gathered together, Jesus asked them, What think ye of Christ? whose son is He? They say unto Him, The son of David. He saith unto them, How then doth David call Him Lord? (here follows a quotation from the Psalms.) If David then call Him Lord, how is He his son?" Matt. 22:41-45.

"And Jesus, while He taught in the temple, said, How say the scribes that Christ is the son of David? (then follows a quotation from the Psalms.) David therefore himself calleth Him Lord; and whence is He then his son?" Mark 12:35-37. And again in Luke 20:41-44.

There is certainly here, in spite of commentators' efforts to keep the strictly Jewish character of Christ, an effort by Jesus Himself to indicate that there was another and greater element. The emphasis of His words was contrary to the official opinion of His day and calculated to modify it radically if not entirely dispose of it.

Twice is Jesus said to have used the term "Jews," once when recalling to his disciples a statement which He had made to the public—"And as I said to the Jews," is the way He opens the reference: and again on His trial, when pressed by Pilate He said—"If my kingdom were of this world then would my servants fight, that I should not be delivered to the Jews." It is impossible to escape the impression that Jesus was speaking as one who refers to a people separate from Him. The President of the United States would not say, in addressing his Cabinet, "And as I said to the Americans." The tone would be alien, and fitting only a reference to aliens. Yet this tone is inescapable throughout the Gospels.

These, then, are some side lights on the question, "Was Jesus Christ a Jew?" and they indicate that He was not a Jew, as commonly conceived.

URBANA ILL

BRIEFLY TOLD

It looks like a long, hard winter in the Canadian Yukon. Twelve thousand cases of whisky have laid in Vancouver for months, stored for permission of the United States Government to cross at Skagway. Desperate efforts have been made by politicians of the North, whose political lives depend upon getting the liquor to those who will hibernate in the Yukon during the long dayless winter. No word has been received from Dawson or Washington. No treaty provides for a safe entrance through the three-mile limit zone off the mouth of the Yukon River and the whisky cannot pass legally from the legal high seas to the legal river.

The Japanese excel in stonecutting. Nowhere in the world will one find more beautiful and perfect granite cutting, which, together with the perfection of its setting, makes the workmanship a delight to view.

"It is significant that this is a government of young men, for the peace of Europe—which was not a peace—was made by cynical old men," declares Samuel Crowther, describing the Mussolini government in *Collier's*.

The usual cause of earthquakes is dislocation of the crust of the earth along fractured lines. There is a fracture line along the coast of Japan and another along the coast of California. The crust of the earth is constantly in motion, up or down, sidewise, or twisting. Millions of years may pass before bringing a strain so severe that the strata will slip or crumble along any great fault in the earth's crust, but when that slip comes there is an earthquake. Usually it is only a fraction of an inch, or at most a few inches. In Yakutat, Southern Siberia, a slip of forty feet was once recorded, and the quake was felt all over the world.

Detroit, a city whose police say has 3,000 blind pigs and whose citizens say has 10,000, has discovered that some "hot dog" stands are operating without a permit.

Every hour, somewhere in the United States, a man's life is taken. There were more than 9,500 "unlawful" homicides in this country in 1921. One of every 12,000 Americans is murdered every year, whereas the figure in Europe is one out of every 634 000. A prominent writer states, "When a prospective assassin in America is about to pull the trigger, he knows that he will have three powerful friends if he commits the deed. These three friends are Sentimentality, the New Psychology, and Technicality. So he pulls the trigger and takes his chances."

The Bible is now published in 770 languages of the world. The Bible Society hopes to continue its work of translation into 300 other languages.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Twenty miles of pearl oyster beds in the Gulf of Mannar, between Ceylon and the southernmost coast of India, have been discovered. The beds are still young and the earliest date of maturity is 1926. The only other pearl fisheries of any importance in India at present are along the extreme southern coast and the Mergui Islands, off Southern Burma. These latter are exploited by Japanese divers and the production enters but slightly into Burmese exports.

The occupation of Constantinople by Great Britain since 1918 has cost England a little less than $150,000,000.

The soil of Spitzbergen has been found to be frozen to a depth of 1,000 feet. In summer the surface soil thaws to a depth of about two feet.

Of about 2,000 kinds of bacteria, only about 100 are believed to be harmful.

Nine years ago, in 1914, China exported $719 worth of hair nets. Last year the net makers, virtually all of whom are located in Chefoo, China, collected $3,319,322 for supplying this product. An even larger trade is expected during 1923 because American women have demonstrated a preference for a type of net made out of two hair strands, whereas before nets fabricated from single strands were the vogue.

Fish at the Pratt, Kansas, state fish hatchery are being fed by electricity. Large light bulbs are placed at the edge of the fish ponds and moths, millers and other insects are attracted by the light. The water beneath the lights is soon covered with the insects which the fish devour eagerly.

The Black Forest of Germany, which has long been famous for its profusion of game, has been virtually stripped of its feathered and furry denizens by hungry Germans.

The battleships *Virginia* and *New Jersey* will be used for targets for bombs in the aerial maneuvers to be held soon.

Corals, whose bodies build into reefs, are carniverous, according to a scientist connected with the United States Geological Survey. Beef juice, crab meat and fish were offered. The tentacles at the outer edge of the coral colony began to appear. Then the stimulus was transmitted to other members of the colony until the surface of the specimen had opened out like a flower. No kind of purely vegetable food was taken by any one of the numerous species investigated.

The annual report of the New York Cotton Exchange contains an item, "Food for cats $51.73." In spite of all precautions, rats and mice occasionally appear on the trading floor. Traps have been employed in vain and the cats are the mainstay in combating the nuisance. The rats eat the ticker tape, often destroying several rolls at a time. Spot, the dean of the Exchange cats, spends the night on the trading floor, sleeping in the engine room during the day when the Exchange closes.

Arabian shieks are carrying vacuum bottles now. All the better equipped caravans that trek out of Aden across the desert are equipped with vacuum bottles and it is now possible to have a cooling drink in the midst of the Arabian desert.

America spends $7,000,000 in one year for works of art in Great Britain alone.

A divining spear with a dial attachment that shows whether the spearpoint is touching gold or a base metal, such as iron, is used by divers in salvaging the $30,000,000 worth of gold bullion which dropped to the ocean bed when a German submarine sank the *Laurentic* off Donegal, Ireland, in 1918. The dial is kept aboard the salvaging ship. The hand moves to the left of the zero mark when the spear is prodded against a piece of iron, copper or other base metal, but when it touches gold the dial swings sharply to the right. The divers are armed with sharp knives to fight off the hungry dogfish that swarm in the deep about the sunken vessel.

Lenin and Trotzky each receive about $55 monthly.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

Knighting a Tramp and a Bootblack

CHRONICLER OF THE NEGLECTED TRUTH

Lifting a Tramp and a Bootblack to Knighthood

Fairy Tales of Fistiana Bring "Fade-out" of the Facts

ON A CHILLY evening in September, 1923, more than 80,000 men and women paid from three dollars to twenty-five dollars to see a bootblack and a hobo hit each other for three minutes and fifty-seven seconds. A former gambling-house keeper paid the bootblack and the hobo more than half a million dollars for their physical efforts. Within another year the bootblack and the hobo will probably meet again, and if they do the gate receipts will be more than $2,000,000 and the bootblack and the hobo will receive nearly $1,000,000 for this second meeting.

North Americans, chiefly those that live in the United States, will welcome the opportunity to see William Harrison Dempsey, better known as Jack Dempsey, and Luis Angel Firpo meet again in a ring. They will gladly pay fifty dollars a seat for the privilege of seeing them. If Dempsey, the one-time tramp, and Firpo, who used to shine shoes in the Argentine, are matched a second time, more money will be paid to see them than was paid at any two previous ring fights in the history of the country. When they fought at the Polo Grounds on the night of September 14, 1923, more than 80,000 were within the walls of the historic playing field and at least 20,000 were madly trying to get in when the gates were barred.

From the brilliantly lighted square in the center of this vast inclosure to the highest concrete point of the surrounding walls were jammed men and women of every race, nationality, color and creed. They represented nearly every profession and trade inside and outside the laws of the land. Included in the list of names of those present, printed in the leading metropolitan newspapers, were the names of the nation's leading bankers, her leading business men, her reigning social leaders. Statesmen, diplomats, soldiers, sailors, all came in person. And their bench fellows on this night were the social outcasts and outlaws. Every stratum of our modern society was represented, for under the powerful arc lights in the center of this human square was to be enacted one drama which has universal appeal.

Dull and Drab Forgotten

UNDER the piercing white glare of the artificial lights a tramp and a bootblack became transformed into heroic figures. They are lifted to knighthood. To the melting pot of humanity that the mantle of night hides about the ring, the bootblack and the tramp have grown into Robin Hoods, for long before the day of their meeting the imaginative and romantic writers of sporting matters have bestowed unto them legendary gifts. They have written around them fairy tales and stories of romance. The dull and drab beginnings of their careers are overlooked in the avalanche of adjectives.

Some years ago in the coal mines of France worked a boy. There is nothing beside the ordinary in this, for in the same mines worked several thousand other boys as drab and colorless as this one. Came a day when a traveling street fakir pitched his tent near the mine and entertained the miners with his small bag of tricks. One of his numbers was a boxing exhibition, at that time new to the districts of the republic. Volunteers were sought and the mine boy stepped forward and gave a creditable exhibition. He impressed the street fakir and he decided to take him along. This arrangement was easily effected.

Just a few years later we discover this mine boy, gained in weight as well as age, described as *l'elegant* of the Bois de Boulogne, the Champs Elysees and the Boulevard de la Madeleine. He is called the Greek god, the Lily of France, the Modern Apollo. He wore a uniform during the war and the public prints describe his heroic feats in the air above the shell-torn battle grounds. The deeds of daring of the efficient war pilots who unfortunately lacked a good left lead and right cross are overlooked to give the preferred position in publicity to the man who rarely flew but who often punched.

The Tales That Are Told

THIS recent coal miner is made the national hero of France, a man more discussed than Foch, Field Marshal of the Republic and commanding chief of the allied armies of the world at the conclusion of a victorious war. Clemenceau, the diplomatic genius of France, is forgotten; so are Rodin, her great sculptor, Curie, her renowned scientist, her painters and her writers. While Carpentier took a fortune out of the boxing arenas, Sarah Bernhardt, greatest actress of all time in France, was ending her days in direst poverty, forgotten by a nation to which she gave more than any actor or actress has ever contributed to one people.

Around this ignorant miner, product of the bowels of the earth, pupil of an obscure and roaming street fakir, are woven the tales of knighthood and romance. He becomes lionized by the nobility of France and the aristocracy of the United States. His name is known in every country of two hemispheres.

Carpentier, judged on his boxing skill, was far from a world figure. In a country that has never produced a single first-class ring performer he ranks well, but compared to the developed strategists of the sport in America he was pitifully unskilled. An honest analysis of Carpentier, the boxer, gave him little standing, but as the hero of these imagined romantic adventures, he was a world figure. The romanticists builded exceedingly well on the scant foundation that the Gaul furnished.

What the Hero Firpo Really Is

SOMEONE has pointed out that the majority of the best writers employed by newspapers are assigned to the sports departments of the daily publications. These men, clever in the use of words, find boxing an incentive for fine writing. No matter how dull or drab the performer is, they can, by an expert use of English, give any stupid prize fighter (or to use the more elegant term, boxer) a charming, attractive and even magnetic personality. The boxer himself, coming in contact with few persons, rides to fame and fortune on the printed word.

Firpo, hero of the September heavyweight brawl, was of the lower class in the Argentine. He lounged about the docks of Buenos Aires, picking up odd jobs. He became a bootblack. He later washed bottles in a drug store.

Firpo tried boxing but met with little success. Finally he came to the United States. He found lodging with a fellow countryman. He worked out in a cellar. He got a match and knocked out his opponent. Came other matches and less than two years after his arrival in boxing he became the contender for the heavyweight championship. In two short years Firpo traveled from the shoe-shining stand to the top class in his profession.

He was extremely stupid. A man of intelligence would consider him illiterate. But as soon as Firpo became a contender and a principal in pugilistic matters, the makers of romance began working upon his case. And now behold Firpo, the bottle washer in a drug store! He is made into a pharmacist and he is described as a man of brilliant intelligence, a scientist who turns to boxing for recreation and to whom the sport is really repulsive. Firpo, the pharmacist, is pictured as he works in his laboratory through the still hours of an Argentine night, wrestling with secret formulas, trying to discover a cure for cancer. He is made slave to the wants of humanity, South America's gift to modern science.

Firpo lacks a sense of humor. This is regrettable.

Just a Giant Hulk

HE IS a giant hulk of a man, this Firpo. Standing in the ring, alongside Dempsey, champion of all boxing champions, the title holder appeared small in comparison to this Latin American of brute proportions. His face is expressionless save for a devastating scowl. When he smiles it is a forced and artificial expression and he has rarely committed this error. He is of the Jack the Giant Killer type of human dreadnought and his huge bulk gave the writers an opportunity for fanciful wording. Firpo became the "Wild Bull of the Pampas," a title not without its romantic and picturesque verbal blending. This brought similar titles.

There was one thing in Firpo's favor—he rarely talked. Had he been garrulous he would have spoiled it all.

Of Dempsey there has been a great deal more written than about Calvin Coolidge since he became President of the United States. But Dempsey walked the high roads, begged food, stole rides on freight trains and slept where he could find lodging. About his life before he became a recognized contender for the heavyweight championship, there was plenty that was sordid and nothing that could be termed romantic. But, as soon as Dempsey becomes a recognized challenger for the heavyweight boxing championship, the writers set about to cloak with romance the hobo of the western roads. Once called literally a "bum," Dempsey is now a wandering knight whose poetic soul cried for the open road, who loved the great broad spaces, the star-crammed skies, the high sun and the full moon. He becomes a thinker, a dreamer, a god of the highways. He is lifted from the beams of a freight car to the heights of romance. He is called the Jack the Giant Killer of the present century.

The Goliath to whom Dempsey played David was Jess Willard. There never was a more colorless character in the American sports or amusement field than Willard. After Jack Johnson, a Negro, became champion of the world by defeating Jim Jeffries, ambitious promoters set about to find a man who could beat Johnson. While the search was on they played upon racial prejudice not because the honor of the white race was at stake, as they claimed, but because they could create a bigger demand for tickets by playing upon the racial chord. They found a number of candidates who would save the white race, and among them was a giant farmer whom they discovered in the wheat fields of Kansas. The giant was Willard who stood well over six feet in height and weighed well over 200 pounds. He was huge but that was all. He knew less about boxing or fighting than any man that ever held a ring championship, but by the power of publicity the promoters were able to bring Willard to a point where he seemed a championship possibility.

In Willard's case the task was not so difficult. Willard was of immense size and that carried its psychological value, for the average man believed that a man as big as Willard and as strong as Willard was reputed to be surely must be able to whip any man smaller than himself, and the other heavyweight possibilities were all much smaller. Also, he was dropped into the setting that had been prepared by race propaganda and making him acceptable was not so difficult as it would seem today in the light of Willard's futile efforts. He took the championship in a bout with Johnson, held in Havana, and which has since that time been branded as an absolute fake. But since Willard won the championship and the white race was again supreme in a fistic way, the manner of regaining supremacy was not scrupulously considered.

Only Corbett Deserved Praise

WILLARD immediately became attached to a circus and stayed out of the ring but he was kept in the public prints. There was on the horizon no one who could be colored into a fistic knight, so the title remained with Willard without being seriously challenged. He defended it once against a second-rate pugilist who never mattered and was beaten into a pulp, figuratively, when he met Dempsey. With a new champion came a new run of adjectives and romantic titles and a new biography for the newspapers.

This building up of American ring idols in the newspapers is not a trick of today but one that has held for years and years. John L. Sullivan remains a national hero. He was the first great heavyweight champion of his country. A plain product of the 'way down east district, Sullivan's name is still a household word although a score of great boxers have come and gone since James J. Corbett took the title from Sullivan by outboxing him at New Orleans. Corbett, who started as a bank clerk in San Francisco, was the only heavyweight that ever carried into the ring a touch of civilized refinement, or social refinement, to be more correct. The writers discovered that Corbett had a pompadour and an amount of good manners so they called him "Gentleman Jim" and "Pompadour Jim." He was not a great champion and he lacked the structure for romancing. Still, that has not handicapped other fighters with less personality than Corbett. He was handicapped, rather, because he followed in the path of a picturesque idol, Sullivan. Corbett never received the publicity that came to Tom Sharkey, a product of the high seas. He was a sailor with a bellowing voice, a ship tatooed across his chest and an anchor on his right forearm. A blustering burly with never an intimation of intending to change, Sharkey lent himself to colorful writing. He was never champion but he became a better known and better liked figure in boxing than the refined Corbett.

Where Others Began

ANOTHER was James J. Jeffries. He was a structural iron worker. Now, there were hundreds of structural iron workers scattered along this broad land from Atlantic to Pacific and most of them were more colorful than Jeffries. When he entered the boxing game he was a burly and surly sort and he remained that until after he lost the title to Johnson. He made an unfavorable impression upon all those with whom he came in contact but he nevertheless became a heroic figure in his chosen profession, one that he always detested. As soon as this colorless iron worker got into the first flight of heavyweights he was described as a person of remarkable personality, a sphinx, a bear, a mastodon, and the late Jack London put the finishing touches upon the romancing by calling him a "cave man," while Rex Beach described him as a "he-man." Both expressions were immediately incorporated into the American language.

The freckle-faced Robert Fitzsimmons, broad of shoulders and thin of legs, a gangling black-

St. Nazianz—the Old World in the New

A Community That Resists Inroads of Jazz Music and Movie World

By FRED L. HOLMES

Above—The first church built by the Communistic Colonists is only used once a year in memory of the founding.

Left—The Salvatorian Fathers have founded a college in St. Nazianz giving new life to this Old World community.

The streets in St. Nazianz are crooked and follow the paths of the first oxcarts through the village site.

ON THE slope of a secluded valley in Eastern Wisconsin six miles from the screech of a railroad whistle, nestles a little, low-roofed village over which hangs an atmosphere of gray antiquity. The community has an Old World appearance. Its crooked streets are intersected by narrow winding cow paths. Across the fields at noon and evening float the sounds of monastery bells. A spirit of religious ecstasy permeates the somber village like a mist. One almost expects to see coming along the dusty road which winds through the village meek palmers returning from the Holy Sepulcher.

Ineffable influences seem to bless St. Nazianz, Wisconsin. It is still the toy town of seventy-five years ago, when it was lifted from the Black Forest of Germany and planted as a communistic settlement among the "kettle ranges" on the west shore of Lake Michigan. Even the rugged scenery of the country lends enchantment. Deep hollows or kettles, fashioned in the glacial period by the melting of buried ice blocks or the building of irregular moraine ridges which inclose undrained depressions, have sculptured the landscape and relieved it of its monotony.

Amid all of the transformations of the outside world St. Nazianz remains unchanged. Jazz music does not disturb. The "movie" is missing. The silver screen with its tragedies of divorcees, its sinister pictures of domestic infelicity, its vampires and sheiks playing coy rôles in city life are not a part of this community life. There is a "Punch and Judy" show where little puppets gracefully nod and daintily dance for the audience.

That is all. Save for the automobiles which plow its dusty streets on hot Sunday afternoons, burdened with hundreds of curious visitors, St. Nazianz is one hundred years from today. Tourists come for an hour and are gone. Even though it is Old World in its appearance, St. Nazianz is content in its simplicity; with its religious fervor and its brotherly dealings between citizens.

The history of St. Nazianz and its religious institutions is probably quite as unique as any in the United States. Three-quarters of a century ago the communistic idea of living was the theme of much discussion and experimentation. Led by their priest, Rev. Ambrose Oschwald, a parish of 113 from the Black Forest of Germany, formed the Emigrant Association of St. Gregory Nazianzen and during the summer of 1854 came to the United States. They wanted a freedom of religious worship, relief from the oppressive economic conditions, and they believed that self-expression and life could best be obtained through the communistic idea of settlement. All members of the organization were Roman Catholics.

Already a stream of immigration from Germany had started for Wisconsin. The "Forty-eighters" had settled around Watertown and Lake Michigan shore district and the new colony was influenced by those who were already here to come to the vicinity.

Unlike other migrations of this character, there were no sunderings of the warm ties of friendships. Nearly the whole community joined the movement and by the sale of their own property in the Old World they realized about $6,000 with which to launch their new home undertaking.

REV. AMBROSE OSCHWALD,

Who led a flock of 113 souls from the Black Forest of Baden, Germany, to the wilderness of Manitowoc, Wisconsin.

The community left Strassburg in May, 1854, and after a voyage covering fifty-four days landed in New York. Here they rested for a time and then set out for Milwaukee, where they arrived in August. While in Milwaukee the Reverend Oschwald purchased 3,840 acres of land in Manitowoc County at $3.50 an acre, on which he made a first payment of $1,500. An advance party of six men were sent to Manitowoc by boat and from there started westward through the forests to the newly purchased lands that were to be their future home.

Strange legends have been interwoven into the selection of the community site. The six "trail blazers" were accompanied by a land agent until their property was reached. A yoke of oxen carrying the supplies for the advance guard was allowed to wander around with their burden and browse in the brush until nightfall. It was agreed that where the animals stopped for rest, there a church and the community center would be founded. The winding trails of the oxcart became the first roads and probably accounts for the crooked streets into and through the village. Old accounts assert that the first church was founded where the oxen stopped for the night.

"But we do not believe that," maintains a merchant of St. Nazianz. "That is only an old story."

Subsisting for a few days on potatoes, without salt, the first comers set to work. The first log house was erected and a cross planted on the site of the church. In the course of a week the company had grown to twenty-six persons. There were many hardships. Before many buildings could be erected, a cold, wet season advanced upon the community, fever broke out and seven of the colonists died.

"Still the pioneers did not lose courage," states an old account which has been preserved by the first settlers. "Daily they worked clearing the land, and hewing the logs, while in the evening they gathered around the fire and enjoyed the company of the leader who entertained them with cheering conversation, so that it was eleven o'clock before they sought their hard couches.

"Early in the morning after their devotions they worked before the slim breakfast was ready. This consisted of thin soup boiled in a large copper kettle hung over the fire from a stout stick. Often the wind mixed leaves and branches in the soup, but as the appetite was strong, this did not spoil the soup. There was no question of bread, because the distant farmers supplied the victuals for a goodly sum of money. After having put up two log huts the building of a church was undertaken. Luckily there was a carpenter among the company and under his guidance trees were cut down and trimmed. The size of the church was thirty-two feet by twenty-four feet. Now a new difficulty arose. There were no oxen left in the community to drag the timbers to the site of the building. The men were obliged to load the heavy logs on their shoulders. Often it required sixteen men to transport one log. Still, on the first day they succeeded in bringing in twenty logs. By the end of October the rough church was completed and the first service held."

Gradually the pioneer colony underwent a development. Stone and frame buildings colored with thick pale pink plaster, in the South German fashion, were erected. Up the hill from the town a stately brick church was reared and close by the "brother houses." More recently the Salvatorian college buildings have gone up, where young men are educated for the priesthood, this being the headquarters of the college for England as well as for America.

Down in the village still another church has been erected—St. Gregory's—where the country folk for miles around gather on Sundays. But on a single Sunday in each year, St. Gregory's is deserted and the boards are removed that bar the entrance to the pioneer edifice. From an ice cream parlor, around the corner, the key is brought to turn the rusty locks, and in the upper rooms priests, nuns, brothers and village folk gather to pay homage to their Creator and to the courage and devotion of the founders of the community.

All went well with the colony during the early years. The married people formed the nucleus of a village; while the unmarried men lived apart in the "brothers' house" and the unmarried women in the "sisters' house." Throughout the countryside the piety of the St. Nazianz colonists became proverbial.

Then came a change in the communistic life. With the death of Father Oschwald in 1873, the community began to decline. Many of the married folk felt that they and their children should be allowed some private holdings of property. Accordingly, certain portions of land were conveyed. The colony dwindled until 1898, when the remaining property of nearly 1,500 acres was taken over by the Society of the Divine Savior. Many new buildings came with the founding of the college, but the entire atmosphere of the community is still decidedly ecclesiastical—still Old World in its outward appearances.

"From the records of the colony," declares W. A. Titus, a local historical writer, "as well as from the accounts of his contemporaries, it appears that the Reverend Ambrose Oschwald was an unusual character. His ability as an administrator was exceeded only by his piety, zeal and devotion to his people. He was fifty-three years of age when, in 1854, he undertook the great task of transplanting an entire community from its native land to a wilderness home four thousand miles away. From that time until his death in 1873, the good priest never ceased to labor for the spiritual and material advancement of his followers. He was a skilled botanist with a special knowledge of medicinal herbs. There was no physician within twenty miles, and people, both Catholic and Protestant, came to him from long distances for medical treatment."

St. Nazianz today presents a commingling of the old and the new in which the old predominates. The coming of fifty college students has not changed the routine life of the community. Most of the houses of the town are of an ancient vintage with a distinct German style of architecture.

The large farm in connection with the college and

Propagandizing the Press

ZION'S HERALD, one of the most able and independent of the church papers, carries as its leading article some candid comment on "The Sorry Plight of the Newspapers." Quotation is also taken from Will Irwin's criticism of the universal propagandizing of the secular press, which, with their commercialization, is asserted to be the reason for the distrust of their reliability among critical readers.

It matters not, so far as the demoralization is concerned, whether the propagandizing is deliberate or unwitting, whether there is purpose in the paper itself to deceive, or the stream is tainted at its source and the paper is itself deceived, the dissemination of information which does not inform has the same effect; worse, it makes it difficult to believe there are exceptions, and that some editors will not vary from the truth.

The conclusion that the religious press only can bring about a change will be considered with some misgivings by those who have opportunity to judge from that department of journalism as it exists today.

Representative papers like *Zion's Herald, The Congregationalist, The Presbyterian, The Continent, The Baptist,* stand out as exceptions to the ordinary church paper in ability, in independence, in tolerance, and in all that inspires confidence, and some of their colleagues not named are worthy of mention, but there is no field more fertile than religious journalism, or more freely cultivated by the propagandist. Witness the unanimous voice of the majority in the matter of the World Court crusade. Without reference to the merits of the agitation, the manner of its conduct has been propaganda pure and simple. The exchange editor knows, but not the reader who sees only the journal of his own sect, that the matter has been furnished by some organization interested in this particular idea, and is not the direct advice of the editor, who in all probability has not studied the subject.

In the matter of Russia, there has been evidence that prejudice rather than reason has influenced the judgment of many. An eminent bishop on the scene has thought it a Christian duty to refute the lies scattered in this country in the news dispatches, and his opinion, as one on the ground, was scoffed at in his own denomination.

Happily, there is a growing sense of duty in the real official church press to fill in the gap left vacant by a recreant secular press, and in that position it offers opportunity for a broadmindedness that will do the world a service, and in so doing advance the Kingdom they serve.

That American Game

HAS America gone football-mad? If you doubt it, try to procure tickets for any of the big college games. Money is refunded as nonchalantly as German marks, with the courteous but firm notation that all seats are sold out. They have been sold out for weeks, in most cases. And furious as the graduate or undergraduate may be, the fact remains unalterable and insurmountable.

Why the tremendous interest and the universal appeal of football? Perhaps, because it is and has remained, in spite of occasional scandals and setbacks, a clean game fairly played; a game of thorough good sportsmanship, which has not yet succumbed to commercialism.

It has become the occasion for general jollification, the opening of the season of social events which mark the college year. The entire college town is carried away by the enthusiasm of the hour, bands blare forth their compelling strains, buildings are decorated in festal garb, and crowds throng the streets, eager-eyed, with ill-concealed excitement, all bound in the one direction—the football field. The innate desire of all to be "in the swim," to be carried away in the enthusiasm of the crowd, blotting out all consciousness of self, and with practically no restraint on conduct, irresistibly leads at this season of the year to *the game.*

The glamour cast about football, the atmosphere of college and college spirit, have lent their bewitchment to make this the most popular game. But all this, important as it is, might fail in accomplishing the tremendous popularity of football but for one outstanding fact. In this generation we Americans have developed from an indoor to an out-of-door people. Theodore Roosevelt is unquestionably in large part responsible for this face-about—at any rate, he voiced a clarion call to the out-of-doors to which the American people today are responding most heartily. Witness the number of people who spend their vacations camping, canoeing or hiking, the constant use that is made of the tennis courts, baseball diamonds and golf links throughout the country, and the demand for city playgrounds. The automobile, too, has played its part in making the outdoors accessible.

Today "The game's the thing," and primarily at this season of the year in America that game is Football.

A Proposed Folly

A BATTLE between the conservationists and the promoters is being waged as to whether the Winneshiek Bottoms along the Upper Mississippi River shall be drained. The bottoms extend for twenty-five or thirty miles between Lynxville, Wisconsin, and Lansing, Iowa. The bottoms are filled with lakes, ponds, sloughs and inlets which afford the finest kind of breeding grounds for ducks, Canadian geese, and other aquatic fowl. Muskrats, mink and other fur-bearing animals are very numerous and the revenue derived from the taking of these animals for their fur amounts to a considerable sum each year.

The proposition is to dredge and dyke the channel of the Mississippi River, lowering the water from every pond and slough from side to side of the river bed. This would cause the death of millions of fine food fish, destroy the homes of numerous wild fowl and animals and create a flood menace of the Lower Mississippi Valley. For it is a well-known fact that the sloughs and marshes of the Winneshiek Bottoms act as a great storage plant for the flood waters in the spring of the year.

When one considers that the estimated cost of drainage will amount to about eighty dollars an acre, the project seems hopeless from a financial standpoint. It should be borne in mind that a similar drainage near Muscatine, Iowa, has proved conclusively that the land is of very little value for farming because the level of the river during flood stage makes it too wet to cultivate the soil. It is sincerely hoped, therefore, that the project will be abandoned.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of The Dearborn Independent, The Ford International Weekly, published weekly at Dearborn, Michigan, for October 1, 1923, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of The Dearborn Independent, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, W. J. Cameron, Dearborn, Michigan; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware, Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

[SEAL] J. EMMET HALL.

Sworn to and subscribed before me this 19th day of September, 1923.

(My Commission expires September 29, 1924.)

Reverence for Courts

THERE are judges and judges. Some judges are elected by, and consequently feel a responsibility to, the people. Others hold life positions through appointment as a reward for personal or partisan political service in no way connected with their fitness, in temperament, mental equipment, or integrity, for the duties of the office, while others are appointed for fitness alone.

The degree of reverence awarded a magistrate or his office by the general public depends largely upon the merit of the individual himself. The public is generally quite accurate in estimating the character of men in public life, and quick to detect those flaws which the armor of office can never conceal.

If there is a growing disrespect for the judiciary, the cause may be found in decisions rendered, in assumption of arrogant superiority by some of its members, and in the intolerant partisanship too often displayed.

Among professional classes protest is not frequent, but occasional outbursts occur, and one fault, too common in many judges seeking publicity—in other words "playing to the gallery"—is thus voiced by a banker, S. B. Whipple, who is quoted editorially by the Chicago *Banker* thus:

"It has come to be a customary, if not popular, practice of courts to visit abuse upon persons called to bar for one offense or another. From the vantage point of the entrenched bench, they very often—too often—send forth upon the helpless persons before them a flood of anathema that fairly sizzles. They say things then that they would not dare to utter elsewhere than in a carefully guarded court. Where do judges find authority for this sort of action? By what right do they assume to administer any punishment—and personal abuse is punishment—beyond that distinctly and definitely fixed by law? They have no such authority, no such right. They shamefully abuse the dignity and power of the high places they occupy when they stoop to personal and vindictive attacks on those unfortunates haled before them. More than that they have resort to the height of cowardice when, securely protected and hedged as the judicial bench always is, they launch assaults on those who, because of the grip of the red-eyed law, are helpless and dumb. There is nothing anywhere, in any law, that authorizes a judge of any station to go one jot or tittle beyond that law's provisions. He may have his personal like or dislike for a prisoner; he may personally approve or disapprove of the prisoner's conduct and characteristics, but he has no right whatever to intrude those personal views into the adjudication of a case he is trying. He breeds contempt when he does so."

The Penalty for Having Sons

FROM a Massachusetts town a widow writes her story:

"I am a widow . . . . Do you know that having four boys means that no one wants to rent you a house? So mothers of families have to take the oldest houses with the fewest conveniences."

The time may come in this country when the above paragraph will read as strangely as those documents which describe how little children four years old were whipped from bed at half past three in the morning to work in the mines of England, and how in the House of the Lords of Britain all ameliorative measures were bitterly fought by the enlightened minds of the realm.

A woman who has presented the nation with four sons must live under the worst conditions, but young couples whose selfish views of life prevent the possibility of children are welcomed to modern dwellings with every convenience. Of course, this condition cannot last. Decency will cure it, or internal decay will end it.

Taking a Walk

ONE of our reader friends, who often takes a little walk of a hundred miles or so, was coming into a town outside of Detroit on top of a milk-wagon one day when this conversation occurred:

Driver—"Say, the boss told me to stop taking your milk if you don't get a milk house soon. There's a milk surplus anyway."

Farmer—"Surplus and shortage always at the same time. How does it come there's no surplus in Detroit?"

Driver—"We're not sending any milk to Detroit—it's all being condensed."

It would pay one newspaperman in every city to walk through the rural districts that supply that city. A whole wagon-full of facts that could not possibly be gathered from business statistics would then be possessed at first hand. Few things are more futile than to read accounts of the high price of potatoes in a newspaper that has never traced a single carload of potatoes from its origin to its disposition.

History and the High Lights

How the Historian Paints Them for Posterity

By T. M. VESEY

SOME ONE in England said recently that "a world without war is a contradiction in terms." It sounds profound, but on examination proves to be just one of those pithy expressions that mean very little, if anything. As an epigraph for a textbook on military tactics it might be not inappropriate; delivered by way of an assertion, however, it has no validity. But a review of the events that have taken place in this world—as recorded in writing, pictorially, and through the medium of memorial architecture—does lend that resonant phrase a simulacrum of truth. Suppose, though, that we endeavor to attain a bird's-eye view, to peer into the bottom of the well.

Most History Is That Telling of War

An examination of history reveals the curious fact that the almost overwhelming bulk of it is war history. War has been to the historian what the plot is to the novelist. In other words, the total number of war years chronicled, taking almost any period of reasonable duration, and for practically every country, is greatly in excess of the number of peace years of which any detailed record survives. What is, in fact, popularly known and almost universally taught as the history of the world is, more correctly speaking, mainly a history of the wars of the world. The orthodox historian, like the producer of melodrama, has subordinated everything to the appeal of the purple patch—with the deplorable result that an impression is conveyed that only through war has history been made, which is a wildly erroneous deduction, the truth of the matter being that nearly all the history of any permanent importance that has been made has been the product of peace and co-operation. Exploration has magnificently played its major part in progress, and exploration, it is true, has not infrequently been attended with war, which, however, was almost invariably incidental to it, and a hindrance. When we attempt to realize how much has been done, despite the war-like preoccupation, it is possible to get a glimpse of what might be accomplished when we cease to be hampered by it; because most of what has been done was consummated during transient periods of freedom from the fighting obsession. It is idle to suppose that mankind has always chosen the only possible path; the way has usually been paved with preferable alternatives. Few human beliefs are more pathetically inadequate than that which lays it down axiomatically that whatever has been must have been well. There is no gainsaying the fact that the world has, in the main, been at more advantage through letting people alone than through battering heads off, nor is it open to question that progress will, as heretofore, be hampered whenever war intervenes.

Ten Chapters on War, and One on Peace

What is known in English history as the American Revolution is a striking instance of the absurdity of the belief that what has happened has happened for the best in the long run. Everybody knows now that England lost the American Colonies through the crass and obstinate stupidity of her reigning monarch and through a spineless administration that let him labor under the curious illusion that he ruled by a right which was in some strange manner divine. Had America's independence come gradually and peacefully, and as a natural result of American growth, a great deal of heart-burning would have been saved since. Coming, as it did, as the result of a war, it left bitter memories behind, which poisoned the relations of the peoples for generations afterward and which, in fact, are by no means moribund yet. And all the historians involved in recording that event were so busy painting foregrounds that they completely ignored perspective. The field of history has always been prolific of epic stories—and consequently has always attracted the dauber. Many of the world's historians ought to have been simply historical novelists. Devoting ten chapters to one year of war, and one paragraph to ten years of peace, as is their wont, they really are little more than historical romanticists.

There is a very good reason for this peculiar bias on the part of the historians. They have nearly all been national propagandists, and practically all of them have written for popularity. They painted the high lights because people wanted them to. When it is realized that most people are willing to believe that practically all a nation's glory has been come by on the battlefield, it becomes fairly evident that war, as war, and not necessarily as a means to some moral or material end, has always made a strong appeal to men. Why? One of the chief reasons for it is not very far to seek, that is, if we endeavor to get directly at the underlying truth of things with the determination not to be led astray by the merely half true generalizations on this subject which so frequently pass for deep and sound philosophy: as, for example, that men and nations fight because quarrelsomeness is one of the outstanding and ineradicable traits of human nature. The acceptance of such a doctrine as this entails the presupposition of a degree of evil in the make-up of mankind to which nobody who still clings to any faith in his fellow men will subscribe. It would, indeed, be nearer the truth to affirm that war, or the desire for it, is a deformed offspring of the inherent good in man, since the leaning toward it arises out of one of his virtues, misdirected.

Casting among human qualities for a more or less feasible explanation of this latent—and, by those who have chestnuts to be extracted from the fire, sedulously fostered—longing to destroy the species, it is no long time before one striking fact emerges from the mass of nebulous speculation and forces itself upon the notice, namely, that of all the gods men worship, among the almost innumerable beliefs and superstitions to which mankind is prone, from the simple faith of the sun worshiper to the esthetic cult of the Swedenborgian, there is one deity that all men and all women in common, irrespective of creed, caste or color, worship above all else, openly and unashamed, and that is the god, Courage. Here, then, we have our clue. Here is one bright stationary gleam that shines clear as a star above all the pale, will-o'-the-wisp lanterns of illusion.

How It Works Out in Pages of Historians

It is natural for men, as natural as breathing, to seek those paths which seem to lead to glory, to strive after those ends the attainment of which calls for a display of the courage that is admired and deferred to, universally and rightly. But now is discerned the trail of the serpent. Throughout the ages the glories of war have been so extolled that it has come to be taken as a matter of course that only in the fighting man's trade do there exist, in any large degree, those opportunities for the exercise of courage and the winning of renown for which most men are not averse to jeopardizing life itself. The real truth of the matter is that war has practically a monopoly of the publicity that hall-marks the actions of men with the indelible stamp of fame. The autocrats of the world, and the reactionaries, with the almost unwitting connivance of most of the historians of all time, have virtually succeeded in getting a corner in the press agency business connected with deeds of daring. In passing it is interesting to note that there is here a wheel within a wheel. One of the reasons underlying that peculiarly servile attitude of respect for the ruling class so frequently displayed by the masses is explained by the circumstance that the former is popularly supposed to be endowed with more courage than is the common herd. Again, the son of the pedigreed sire is, as a general proposition, no braver than the hash-slinger's boy. In point of fact it may reasonably be argued that he is relatively less brave, because he ought to be actually braver. A great part of his early training, in the home, at the colleges and at the universities, is aimed at teaching him never to sell his "birthright" by showing the white feather; never to be so false to the traditions of his class as even to seem afraid; whereas little relative to the virtue of courage is inculcated in the child of the working class, the "lower orders," who has therefore only his natural instincts to guide him. The late World War provided conclusive evidence, nevertheless, that John Brown, of Nowhere, could stand shoulder to shoulder with Van de Vere, could fight with the best and the bravest of those whose lineage might have sprung from sources undefiled by plebeianism. All other wars have proved this too, of course, but not so unmistakably. For one thing, Van de Vere's corner in publicity was a more impregnable stronghold in earlier times than it is now. For instance: the fame, as well as the family name, of the English nobleman who, placing himself at the head of his Hussars in the Balaclava Valley, drew his saber and cried: "Here goes the last of the Cardigans!" still rings through the vaulted halls of time (the acoustics of which are designed especially to echo only the deeds and sayings of the exclusive), while the Six Hundred who likewise "went" are remembered only collectively. Even the genius of a poet was powerless to immortalize them in anything like an individual manner. The record of their separate deeds of heroism is lost in the obscurity incident to their being merely the component units of a mob, and the horses they bestrode are presented to our mental vision in as clear-cut a picture as are the men themselves.

A few hundred Greeks, likewise, once held the pass of Thermopylae, and the name of only one of them, Leonidas, has come down to us. Yet the roster of that famous legion would surely be an interesting one.

As a matter of fact, the best thing we have been able to discover in years about the scion of the famous family, whatever it might be, is that he did stand side by side with John Brown when the Hun came hammering at the gate. And, signs on it, his fame will be remembered after John Brown's has been long forgotten; that is, unless we train a new school of historians and consign to oblivion the lucubrations of those moldly plagiarists who can do no better, when they write of events, than follow the precedents of those chroniclers of old time who disseminated their propaganda and shuffled off this mortal coil when there was less history to record than there is now.

We Thrill to One But Not to the Other

Revolutionary as the assertion might sound, it is, nevertheless, a substantiated truth that men need as much courage to make them go to work as to induce them to go to war. Work has its romance, its glories, its epic tales of resource, of heroism and of sacrifice, no less than war. What it lacks is merely a proper publicity program.

To take an example: Everybody will recall the indomitable heroism of the women of France and Flanders, both in and out of the immediate war zones; how the latter worked the soil from dawn to dark, switched the trains, kept the essential businesses running, toiled in the pits, coal-blackened and stripped to the waist; and did a hundred other things that helped to win the war: how those who were driven, with their few belongings, from the ruins of their wrecked homes plodded bravely along the débris-strewn street of the erstwhile Sweet Auburn in which they had spent their hitherto uneventful lives, and, even when forced to the broken walls by our advancing troops and the guns that thundered by, when all was lost but their patriotism, with the light of their blazing villages gleaming in their eyes, they still had fortitude to shout (translating the phrase into good American): "Down with the Germans!" Who does not recall such scenes? Indeed, will they ever be forgotten? And so, in glorifying the women, who deserve it, we glorify war, which does not. But wait: here is another cameo. On every wild and dangerous coast it is no uncommon sight, especially in winter, to see women—rough, red-armed and raucous—plunging breast-deep into the breakers to expedite the launching of a lifeboat that contains everything they hold dear in the world, husbands, sons, brothers, sweethearts and fathers; and that lifeboat puts to sea, everyone knowing full well that it may never return, to try to save, from a sinking ship, a crew of strangers who often do not even speak the language of their rescuers. Is not this obeying man's noblest and most courageous impulse—not to send his fellow man to an untimely end, but to snatch him from it? And the women; does not the impulse that actuates them raise them high as any among the daughters of men? However, an epic such as that gets half a column in the morning editions; often not even that, if nobody happened to be drowned. And so we find that Joan of Arc is a far more outstanding figure in history than, say, Grace Darling. Of course, it is so. There is no valid reason why a suit of chain mail on a battlefield should cut a broader swath in the popular imagination than a fisher girl's shawl in a rowboat; but it does—thanks, mainly, to the historians.

Work of World as Thrilling as Story of Wars

The story of the work of the world is just as great, just as thrilling and moving, as the story of its wars, as would be seen were it only to be told as fully and as eloquently. One day it will be. Seen with the eyes of human understanding, a harvest train pulling out for the West is just as brave a sight as that of a battalion marching aboard the ship that is waiting to carry it to some far-off field to decide the questions that diplomats have raised and to which they can find no answer save the sword, found in everyone's hands but their own, incidentally. And running a concrete mixer, or a winch on a ship's deck, has just as much of glory in it as running a machine gun. But most of the rhetoric of which man is capable is expended on advertising the glory of the latter. It is high time, indeed, to reorganize the publicity bureau. Let us endeavor to see things as they are, and not through the blackened glasses of prejudice and illusion. "To thine own self be true, and it must follow as the night the day, thou canst not then be false to any man."

A Comet on Municipal Horizon

Jacksonville, Illinois, Credit Not Good for 60-Cent Telegram Five Years Ago; Co-operation Saved It, Says Mayor Who Serves Without Pay

By EMERSON ROBINSON

EDGAR E. CRABTREE,

Mayor of Jacksonville, Illinois.

OCCASIONALLY there flashes on the public horizon, like the periodic visitation of a comet, a report of an American city that is not in financial distress.

Take the case of Jacksonville, Illinois.

Five years ago, Jacksonville was a glaring example of what a city should not be; today it is the model town of Illinois, the envy of its neighbors and the best advertised, from a governmental standpoint, of any city in America.

There has been a revolution in Jacksonville, or perhaps it would be better to say that there has been a revolution in the thoughts and minds of her population. There has been a transformation, a metamorphosis, and the city has become one of which its citizens are proud. The "knockers" have been reduced to a minimum; criticism, however, is desired and desirable.

Opposition is negligible, due to officials conducting an open forum; there is nothing secret; the humblest citizen may file his complaint and get the same hearing as the most influential property holder.

The unusual position of Jacksonville in current American municipal history is due to two things:

First, the confidence which the people have in their officials; second, the "unselfish service" of the officials and the co-operation of the public.

The example of Jacksonville might be followed in any of the smaller cities of the country. It would be more difficult in the great centers of population where the interest in city affairs is more impersonal. In the small town it is personal.

A dozen years ago Jacksonville was like any other city; probably no better and possibly no worse. But the people were dissatisfied.

The debt was increasing and the tax rate did not yield the revenue which officials thought sufficient to give a proper progressive government. Then the "commission form of government" idea was at its zenith. It was taken as the panacea of all municipal ills. Jacksonville fell and the commission form held sway. But it did not prove the leaven which the people wanted. Things became worse. The debt grew by leaps and bounds and the annual deficit in current expenses became greater and greater.

Civic pride was at a low ebb. "I don't care" attitude was assumed by a majority of the citizens, and they didn't, for there was little in Jacksonville at that time to appeal to them. Gambling, immorality and vice, combined with a government which failed to govern, had brought about a condition in the minds of most of the residents which made them, to say the least, careless in their relations with city affairs.

Then something happened and this something laid the foundation for the present happy condition of Jacksonville.

Dollar-a-year Men

THE city is thirty miles from Springfield, capital of Illinois, and in the great corn belt. One of its greatest material problems always has been the supply of water, for often it does not rain during the entire summer. Various attempts had been made to solve the problem. Thousands upon thousands had been spent on wells, but these served only in part to fill the city's requirements. A franchise was let to an eastern concern which undertook to bring water twenty miles from the Illinois River beds. More than $400,000 was sunk in the venture, which proved worthless and was later sold for junk for $25,000.

A few business men began to fear for the future. Unless Jacksonville was assured of an adequate water supply at all times, it could not hope to grow and there was the omnipresent danger of a conflagration. Sixty of them pledged $100 each to employ engineers in a final effort to bring relief. The engineers reported that the city had within its own limits a sufficient supply if it would buy 400 or 500 acres of land close by, erect a levee and impound the waters which came in the wet season. This, of course, necessitated the construction of a filtration plant,

In the financial status of the city, a bond issue was impossible, so the men conceived the idea of buying the land, mortgaging it to a trustee, issuing mortgage bonds to the subscribers, turning the property over to the city subject to the mortgage and permitting the indebtedness to be paid off in twenty years out of the revenues. As far as many of the subscribers were concerned they did not care whether the bonds ever were paid because they would benefit indirectly in the assurance of sufficient water. But the idea worked, all the bonds have been paid when due, and the consumption has more than trebled.

This was the beginning of the "government by co-operation" idea.

It also was the beginning of the nullification of politics in Jacksonville government. The people were pleased with the solution of the water problem and they began to ask themselves whether it would be a good plan to drop the commission form and return to the Federal plan.

The new vision opened up the possibilities of a cleaner and more acceptable town, and leaders among the business men began to look around for a suitable candidate for mayor. They drafted one. He did not want the job because he was too busy with his private affairs, but he looked upon his duty to the community and was persuaded to run.

Jacksonville in 1919 really came to know Edgar E. Crabtree, and its history since then has been one of constant growth and achievement.

Crabtree is known throughout Illinois as a banker, largely because of his success in putting over war loan and other campaigns. He also is known in business circles for his activities in the chamber of commerce. But he is better known, not only in Illinois but throughout the nation, as the mayor of Jacksonville. He did not want to be mayor. It meant nothing to him, but when it was pointed out that he of all men was best equipped to restore public confidence in a community where the morale was extremely low, he capitulated on the condition that he be allowed to serve as he pleased.

He was elected by a vote of four and a half to one. Six aldermen were elected on the Crabtree platform of "No pay; No politics," as were the city attorney and city treasurer. Two aldermen were elected on a pay basis and Mayor Crabtree insisted that they be paid. The attorney for the city was one of Jacksonville's foremost attorneys. Each man that first year received one dollar for his services.

Politics Are Barred

THE mayor and most of the aldermen have served for four years on the same platform and with remarkable results.

The city is on a pay-as-you-go basis and improvements long neglected have been made.

There has been no saving in actual dollars and cents outlay because it was not possible to do so, and give service. The town was physically dilapidated and the administration set about practically to rebuild it.

This year it went on a strict budget plan. Each department is required to conduct its affairs within the allotment and next year it will be even more strict and more in detail. Heads of departments vie with each other in saving and in watching their accounts, and city workmen give the same attention to their duties as those employed by private concerns.

It is related that shortly before the new mayor took office a city employe went to a telegraph office to send a telegram. The cost was sixty cents. The telegrapher was instructed to charge it to the city. "Not me," he replied. The credit of Jacksonville was not good even for a telegram. Today it is on a sound financial basis; there was a floating indebtedness of $131,000. It was taken care of by a bond issue.

Politics are barred in city affairs. So is the secret caucus in which politicians arrange public contracts and public milkings. There has never been a private session of the council in four years. All conversations are in the open and there has not been a negative vote of any proposition. If the mayor submits a proposal and it does not appeal to council, it is voted down and he is graceful in bowing to its will. But this does not happen often, for the mayor does not submit anything which he is not thoroughly convinced is for the good of the city.

With the election of the new mayor real co-operative government began. The mayor went down to the city hall a few days before he was to be installed. The council chamber was in a bad way. It had not been decorated for years and Crabtree believes that proper surroundings and environment lead to better and more cheerful service. Leaving the hall he started to his office and on the way met the president of the painters' union. Crabtree asked if the union would see to the painting of the council chamber if he would buy the paint, and the man readily agreed. The mayor was eager to do this but did not get to buy the paint, for a reporter on one of the papers got hold of the story and solicited hardware dealers to donate the paint.

Later Mayor Crabtree found the books of the city in poor condition, so poor that they did not even tell the debt of the city. He went to an accountant in St. Louis and explained the situation. The company sent a man to make an audit.

There was no charge to the city; the mayor paid out of his own pocket for the hotel expenses and railroad fare of the auditor. When the audit was completed, the mayor knew exactly what the financial condition of Jacksonville was and the problem he had to meet in this respect.

It was then that he learned that the floating debt of the city was $131,000. Repeated attempts to float bond issues had failed, but the mayor and his advisors felt that their work would be greatly handicapped if this were not done. The co-operation shown in this movement was the first outstanding indication of the confidence of the public in the new administration. There was so little opposition that only 190 votes were cast against it. At the same time bonds for the new filter plant, much needed, and for the removal of the light and power plant resulting in later economies, were voted.

To Free City of Debt

MAYOR CRABTREE believes that it is the duty of citizens to give of their time for the benefit of the community. Whenever there is any new problem, he presents it to the civilians. Committees are named to investigate sewer propositions, streets, sidewalks. There are even civilian police, so-called. This resulted from a complaint filed by an indignant citizen.

It was found necessary to levy a wheel tax to get revenue to repair the streets, but there was no objection, which serves to show the spirit of co-operation in Jacksonville. In the four years there have been approximately five miles of paved streets laid and nearly thirty miles of new sidewalks. Yet the tax rate of Jacksonville is not soaring and the people are not complaining, because they are getting efficient service for the money expended. There was a fire recently in the business section. The department ladder did not reach to a sufficient height and the building was destroyed. Financial conditions did not warrant an outlay by Jacksonville but the business men foresaw what would happen to their stores if there should be another such fire. So they got together and bought a truck and ladder and presented it to Jacksonville.

The city needed a new hotel and the merchants and manufacturers have organized to build one. It will cost more than $200,000 and will have 125 rooms, a large hotel for a city of 16,000, especially when that city is so near a much larger city.

Mayor Crabtree believes that every citizen should take an active interest in civic affairs. It was this belief which led him to tell the citizens of Jacksonville that the city could not pay him enough salary to take the job, and it is this spirit which lifted a town, dirty and "down at the heels," to one of the cleanest and proudest in the state. When a community loses confidence in its officials the only way to regain that confidence is to carry every message to the people before attempting to do anything. The mayor goes on the theory that when the taxpayers believe an administration is honest and making a sincere effort to serve and give a dollar's worth of service for every dollar paid into the treasury, then they will get behind the government and support it.

He hopes before the term of his service expires to be able to leave the city free of debt. He believes it can be done with the co-operation of the public but not without this co-operation. It is not his ambition to have public officials serve for nothing or to become dollar-a-year men. But it was his ambition to put Jacksonville on its feet, and he has done so. Administration officers received in salaries when he was elected mayor close to $10,000 a year. Now it is about nothing.

The office of mayor cost Jacksonville $17.70 last year. Of this sum ten dollars went to the municipal league for membership and the balance for telephone calls. The mayor not only has not received any salary but he has given of his own money for the betterment of the city, paying his own expenses wherever he went to represent Jacksonville.

In a recent address Mayor Crabtree made these characteristic remarks:

"The average business man hesitates to run for office because he does not like the campaign work, the labor of it, the vicious stories. He says to his son, 'keep out of politics because it is low and dirty,' but the son might reply that it is low and dirty 'because you and your friends never pay any attention to it.'"

"Can a good government be the reward of people whose better portion refuse to take any active part in it?

"You can assist by taking hold of the affairs of government yourself, creating a desire for efficient government, arousing the citizen to his duty, serving as official yourself; you cannot do these things by proxy. Government is the business of the individual citizen. There is no complaint against the form of government but against its misuse.

"Remember that always: We will get just as good government as we want and no better.

"The city that gives the public the best service is the city that is going to win. Service does not mean how much I can get out of my city but how much I can give.

"Get into unselfish politics. It will be good for your soul."

Beautiful City of the Sun Mystery of the Ages

Temples Built at Baal, in Syria, of Stone That Makes Pyramids Insignificant

"Six columns against the horizon."

IF EVER there was a city of mystery it is Baalbek, or the city of Baal, in Syria. The Greeks called it Heliopolis, the City of the Sun, which meant the same thing as the earlier name, since the Greeks recognized Baal as a solar divinity. In Baalbek there was a temple so massive that although it was systematically defaced for one hundred years, and although it has been used for fifteen hundred years as a quarry, its outlines may still be traced. In comparison to it the work performed by the Egyptians in constructing the pyramids and in hewing huge tombs out of the rock pales into insignificance. Even such modern wonders as the Woolworth Building seem puny in contrast to the temples of Bacchus and Jupiter Baal. Not in the matter of height, but in the weight and size of the construction units, those temples are unique.

When it is recalled that, so far as anyone knows, the builders of these temples had none of the modern machinery that is supposed to make it possible to lift any weight, the work done baffles explanation. The largest cranes lift one hundred tons today, and are considered marvels of engineering skill. But in Baalbek, without machinery, unknown builders of ancient times lifted single blocks of marble weighing 1,500 tons each. Not only that, but they polished the ends and put them together so cleverly that the joints are invisible to the unaided eye. And in at least two thousand years their descendants have found it impossible to move construction units that they used for building a terrace to the two temples.

Modern Syria, as bounded under the terms of the mandate that gave it to France as a mandatory of the League of Nations, covers approximately the same ground as ancient Phoenicia. It was one of the richest of ancient nations, partly by reason of its location as the junction point between Europe and Asia, and Baalbek was its most famous city. The great god Baal was worshiped throughout the East, but never so devoutly as in Phoenicia. The Hebrew prophets called him Beelzebub at times, and in other countries he was variously known as Bal, Beel, Bel and Bil. In the year 65 B. C. the Romans added the name of their own god Jupiter to Baal.

The Grand Patriarch of the Maronites, the Christian sects living in the Lebanon, has given the following explanation of the Baalbek temples:

"Tradition states that Baalbek is the most ancient building in the world. Cain, the son of Adam, built it in the year 133 of the Creation in a fit of raving madness and with the help of the giants who were punished for their iniquities by the Flood."

Dr. George Byron Gordon, Director of the University Museum of Philadelphia, has made a study of the ruins. He points out that in contrast to the eastern tradition, western scholarship is even less explicit in attempting to explain the origin of the temples. For although they are attributed to the Romans, nowhere in the ruins has there been found the usual inscription containing the name of the builder.

"As you approached Baalbek along the plain between the Lebanon and the Anti-Lebanon you see in the distance six columns against the horizon rising majestically above their surroundings," says Dr. Gordon. "As you come nearer you can see below these columns a mass of ruined buildings that take shape gradually as you approach. This is the acropolis, and even from a distance the traveler can distinguish clearly two of its main features. The nearer of the two is what we may call for the present the second temple standing against the background of a larger edifice in which the six soaring columns are seen to be raised on a platform. Heliopolis was a walled city and the acropolis stood within the walls in the southwest area. Some of the ancient city walls are still standing and the northern gate is almost intact, but the principal object of interest is the acropolis, now a mass of ruins.

"The second temple stood apart, a little to the south, raised on its own platform fifteen feet in height. The main temple with its approaches stood on a stone platform raised twenty-six feet above the ground level. It was 1,100 feet long from east to west and 440 feet wide from south to north. This stone platform did not rest on a solid mass of earth or masonry. It was supported on a series of arched vaults of massive masonry running the length and breadth of the platform and crossing each other at right angles. These vaults are still intact and the platform above them is also unbroken. Besides these vaults there can be seen under the same platform two large halls with walls and ceilings covered with beautiful and intricate sculpture."

Within the temple was a hexagonal court, 260 feet across, and a square court 440 by 385 feet, each with central areas open to the sky. Around the margins of that area in the larger court were once Corinthian columns twenty-five feet high, supporting a sculptured entablature nine feet high. There were two basins for running water in the court, each sixty-eight feet long, twenty-three feet wide and three feet high, richly sculptured on the outside. Between them was the great altar, thirty-four feet high. In and around the building can be counted 350 niches for statues. The columns of courts and propylon were 200 in number, monolithic shafts of red granite twenty-five feet long and three feet in diameter.

"That rose-colored granite is not found anywhere in Syria," says Dr. Gordon. "It is found only at Aswan in Egypt, 700 miles up the Nile. All these granite shafts, therefore, were quarried at Aswan, floated down the Nile, rafted across the Mediterranean Sea and hauled over the Lebanon Mountains to be set up at Baalbek.

"I come now to an amazing feature that has taxed the credulity of generations of men ever since Baalbek was rediscovered in the sixteenth century. Around the three exposed sides of the temple, below the bases of the columns and at a distance of twenty-five feet from the wall of the platform on which it was built, there is to be seen today an unfinished rampart which remains exactly as it was left by the masons, the space between the rampart and the platform wall being filled in with solid masonry. I will only call attention now to the fact that the upper course of stones on the west side of the rampart consists of three stones, not counting the ends of the side courses, and that the total length of that west section of the rampart is 225 feet. Each of the two side courses, one on the north and one on the south, contains nine stones and the length of each course is 335 feet.

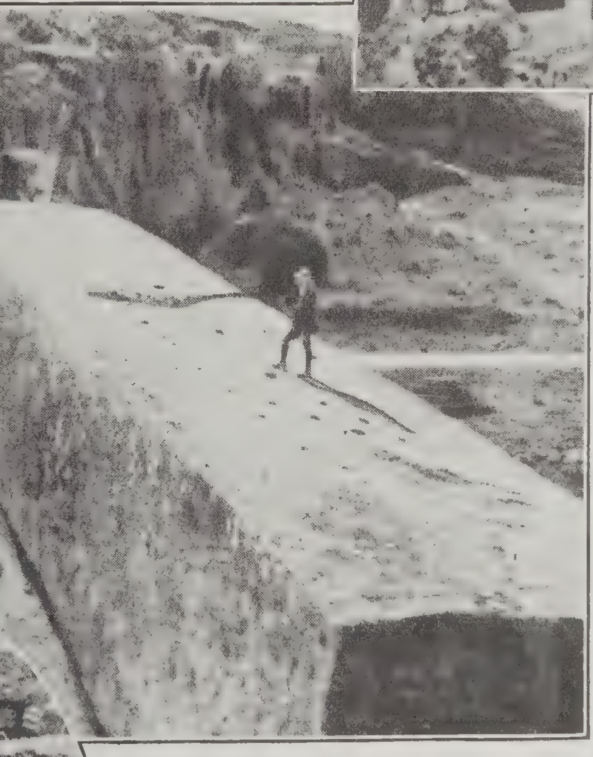
"The course of stones in the southern range was intended to carry another course of the same dimensions and that was to carry a third course forming a huge ornamental cornice giving a finish to the top of the wall. Each of the stones in position is fifteen feet high, fifteen feet wide and forty-four feet long, and there are nine of them in this course. Two more courses of these stones would bring the top of the rampart wall up to the level of the platform wall and to the bases of the columns. The space between was to have been filled up with solid masonry to form a terrace running around the three sides of the temple and commanding a magnificent view on all sides.

"On the western side of the rampart wall, which is the end wall, the second course of big stones was already put in place. This course of stones is 195 feet long and it consists of three stones. Each of these stones is fifteen feet high, fifteen wide and sixty-five feet long. One more course of these stones would bring the wall up exactly to the level of the columns of the peristyle and on a level with the platform wall, which is twenty-five feet inside. Of special significance is the fact that the faces of these huge stones are not finished.

"Let us now go to the marble quarry three-quarters of a mile away and see what we shall see. At the entrance to the quarry we find a stone, a block of marble of uniform quality and without flaw, sixteen feet high, sixteen feet wide and sixty-nine feet long, and it weighs

(Concluded on page 10)

A corner of the smaller "Temple of Bacchus" at Baalbek.



This single block of marble, 69 feet long and 16 feet square, was to have been moved to the Temple of Jupiter Baal when construction was halted.

Showing the V-shaped groove between two 1000-ton blocks of marble, the joint itself being invisible to the unaided eye.

Gold Bulging Our Bank Vaults Not Ours?

We Are Not Buying Foreign Securities But American Bonds Are Going Abroad

By W. H. ALLEN

> **"The Great War has filled the coffers of our banks with the bulk of the gold of the world. Some of this gold really belongs here, but the greater part is loaned to us, otherwise our prosperity would be in jeopardy." (Harriman National Bank statement for July, published in New York Tribune, July 2.)**

SINCE the latter part of June New York newspapers have carried a number of statements which are of peculiar interest to those who make a study of financial questions. For instance: *"American dollars popular abroad. Shipment to foreign countries at a rate unparalleled in history. Estimated* that *$500,000,000 goes abroad annually."* (New York *Times,* June 23.)

"One hundred ninety-four million dollars Federal Reserve Notes exported in 1919 and 1920." (Treasury Department letter July 27.)

"New York borrows abroad. Little doubt is entertained here that in consequence of the steadily maintained disparity between London and New York money rates, *considerable American borrowing* has taken place here." *"Advance in British bank rates to check United States borrowing in London."* (New York *Tribune,* July 9.)

"British invest in our *liberty bonds and undigested securities."* (New York *Times,* July 9.)

These several statements make curious reading for those who have imbibed all the stories that have been circulated about our wonderful financial progress.

Ever since the first year of the World War we have been told that the United States had changed from a debtor to a creditor nation. We had canceled a prewar debt of $3,000,000 000 and the world owed us more than $20,000,000,000. We hold more than forty per cent of the world's gold! This plethora of gold, it was asserted, is an actual menace as it might lead to a dangerous expansion of credits and a wild orgy of speculation. To avert this menace it was claimed that we should lend our surplus gold to Europe to stabilize her currency and restore her prosperity. Thus "lend to Europe and solve our problems" became the popular cry in Wall Street. This is the current theory of the international money situation as originated by the foreign bankers, and confirmed by D. R. Crissinger, governor of the Federal Reserve Board, and other high authorities.

But how does this theory square with the situation described in the newspaper statements?

If we really own so much gold that it is a menace, why should we be exporting bank notes at this unparalleled rate?

In view of the Harriman Bank statement that *the greater part of this gold is only loaned to us,* what becomes of all these boasts about our metallic wealth?

If the United States is the creditor nation of the world, able to stabilize Europe's currency by advancing more credits, why do we have to borrow from England on such a scale that she raises her rate of discount to bar us out?

And finally, *how is it that Europe, to whom we have been lending billions, has surplus funds enough to invest in our Liberty Bonds and undigested stocks?*

Mellon and Bank Disagree

THE truth is that this history of the international money market is a flat contradiction of the boast that we are a creditor nation. The theory does not dovetail with the facts.

If the $700,000,000 gold that came here in 1921 had been in payment for commodities, it would certainly have caused a great revival in general business. But we know that it had the reverse effect. Here I may quote the National City Bank's statement of February, 1923, that, "A year of such industrial depression as we had in 1921 cost this country more than the sum total of the Allied Debt." Now if the $700,000,000 that came here in 1921 had come in payment for commodities, the money stringency, the widespread depression in trade and industry, and the numerous business failures could never have occurred. It would have been an economic impossibility. There is no instance in the history of any country where such conditions followed an abnormally large increase of monetary gold.

Referring to my suggestion that this new gold was not American-owned, Mr. Mellon said:

"There is no question but that the gold imported during the past two or three years is owned in this country, and there is no reason whatever to think that any large amount of it is held for the account of any foreign country. In fact the greater part of this gold is held in the Federal Reserve banks."

But the fact that the coin is in the Reserve banks *is no proof that it is American-owned.* The greater part of our gold was in these Reserve banks in 1919, and yet the Department of Labor reported that at that time every dollar of gold and silver in and out of these banks was owed to alien laborers (a total of four billion dollars). Mr. Mellon makes no mention of this alien lien in any of his reports, and so we conclude that he doesn't know anything about it. When the first German reparations payment of $80,000,000 was made to agents of the allied nations in 1921 we know that *the money was redeposited in the Federal Reserve banks. It was in American banks, but previous to payment it was German-owned, and after payment it was Allied-owned: it was not and is not American-owned.* Hence it is clear that what Mr. Mellon considers conclusive evidence of the American ownership of this gold is no evidence at all. In fact the redepositing of the gold in these institutions rather strengthens the belief that *most of it is foreign-owned.* And this belief is confirmed by what the Harriman bank further says on the subject:

"It is a mistake for the Federal Reserve Bank to allow all the gold to appear in the ratio. The major portion of the gold we hold should be put aside as merchandise, earmarked, until it is again required by international trade. In other words, a lot of yellowbacks are now issued against *gold that is with us only temporarily.*

"If this gold is so set aside, banks, when called upon by their customers for accommodation, must naturally resort to the Federal Reserve Bank, it is true, but that is what the Federal Reserve Bank is for, and it is better to do this now, gradually, rather than to wait for the precipitate demands for this gold as a result of the reparation settlement and consequent credits to be established for Europe. If this is not done we shall once more, as on so many frequent occasions, repeat the hysteria that *always* has arisen when this country was 'losing its gold.' *It is not ours, and should not be so regarded."*

Mr. Mellon should meet this point-blank contradiction of his claim that Federal Reserve coin must be American-owned, or confess that he is mistaken.

Bank Notes Go Abroad

THE exports of our paper currency must also be taken into account here. Every bank note thus exported is virtually an export of gold, as it must be redeemed in gold. Hence it is a lien on stock of the metal. This movement started many years before the war. Of late years it must have grown enormously if the shipments now total anything like $500,000,000 a year. Judging from the numerous reports, these bank notes must have an extensive circulation in Continental Europe. But apparently Mr. Mellon has no knowledge of this other lien on our metallic currency as he makes no mention of it in any of his reports.

Government experts seek to belittle the effect of this movement by explaining that part of the currency will be sent back in payment for our goods. But if we had to export the currency in part settlement of these invisible debts in years when the balance of trade was running a billion dollars or more in our favor, then we must certainly have to export still more currency now when the balance of trade is actually against us and these invisible debts are growing larger. The only way we can lessen such exports is by selling or pledging more securities, or by borrowing abroad as we happen to be doing it at this present time.

Our loans to foreigners make it hard to convince people that we are not a creditor nation. As to our government loans to the Allies, we lent only paper credits which were used to purchase our goods. Until such loans are canceled by shipment of gold or goods to this country they are a burden upon our own people. And from present signs they are not likely to be canceled for many years to come. Excepting the few hundred millions paid by Great Britain, we haven't even received any interest on the loans. And it is safe to say that British investments in our stocks and property largely exceed the $4,000,000,000 she owes us.

This trick of paying a debt and calling it a loan explains nearly all the foreign bond deals in the last twenty years. The fact that practically all such bonds have gone back to Europe sustains this view. Nearly all of the Dutch East India bonds of 50,000 000 guilders floated here in July, 1922, have already gone back to Holland. During 1921 foreign bonds floated in this market aggregated $625,000,000. But the general money stringency and the sheer reduction of loans of fifty-five per cent that year afford clear proof that there was no such surplus of real American capital available for these investments. At that very time it was known that foreign bankers had immense credits here. Referring to the renewed money tension here, the *Post,* October 1, 1921, says: *"Holdings of cash for account of foreign governments reach an aggregate far beyond any estimates that have been made."* A fairly correct estimate of these holdings and those of foreign capitalists is obtained from the reports of brokers loans which in January, 1922, aggregated $2,000,000,000. Practically all such loans are made with foreign-owned funds.

The latest and most striking proof that it is not real American-owned capital which is going into these foreign loans is shown by the sale of the Swiss bonds here on August 1. Switzerland is financially the strongest country in the world and her banks are fairly glutted with gold. Her bank rate is the lowest in the world and her securities are not hawked about on foreign markets. Hence she has no need to borrow from us.

And finally the financial history since last June conclusively proves that we have no surplus funds to put into low-interest-bearing foreign bonds. *We are exporting paper currency because we have no gold to pay our foreign debts, our big gold supply is foreign-owned,* our undigested securities are being sold or pledged to foreign capitalists, and *we are borrowing so heavily abroad that foreign banks have raised their rate of discount high enough to bar us out.* Experts explain that our borrowing abroad was made possible by the lower money rates in London. But there are now (August 8), and have been for years, lower money rates in London than in New York. In other words, the conditions have been permanent, not temporary.

This is the situation which confronts us today. We are a debtor nation—and more of a debtor than ever before. This financial history fully confirms the theory of the matter which I have exploited in various articles in these columns.

Finance Organs Silent

IT IS significant that the financial publications have very little to say about the situation in July. Even the National City Bank bulletin, which usually devotes much space to foreign exchange, hasn't a word to say on the subject in its August issue. All its space is taken up with discussion of prospects of wheat, cotton, corn, transportation, labor, wages, costs and prices. The coming Presidential campaign will force a discussion of this question which is bound to bring out the truth. Senator Oscar Underwood has announced himself as a candidate for the Presidency, and the chief plank in his platform is to extend more aid to Europe. "The world owes us $18,000,000,000 to $20 000,000,000. Of the $5,000,000,000 in American securities formerly held in Europe, none are there now." This, in substance, is the bankers' theory, and it goes to the root of the whole matter. But as the financial history of July last offers a flat contradiction to this theory, the bankers will not encourage a wider discussion of the details. The Senator will be advised to confine himself to generalities, and not to answer impertinent questions. But it will be the duty of opponents to force this wider discussion to bring out the whole truth as to whether we are able to extend further assistance to Europe.

And when this whole truth about the international money situation is clearly understood it will furnish a basis for the solution of related currency problems.

St. Nazianz—the Old World in the New

Concluded from page 3

institutions is still operated by lay-brothers, many of whom have come from Germany. In a level field an old man was plowing. His beard was long but he did not wear the habit of one of the members of the order.

"Do you live here?"

"Yes—I have lived here all my life, first in the village and now here. I am Brother Albertus."

"How did you happen to enter the brotherhood?" was asked.

"My wife died ten years ago. My daughters are now in the convent—the Rose Convent." He pointed in the direction of the pink plaster convent of the "sisters' house." "My son and I are here." Just then he turned to his plow and went on singing a little hymn.

As I left the monastery yard crowded with flower beds which filled the little space between the gravel walks I met another wearing a long black robe—the sacred garb of the order—tied at the girth with a cincture of black flowing cord. The wide sleeves, falling away, showed up to the elbows the muscles of his bronzed arms.

"Is this your home?" I asked.

"I came here five years ago from Germany," replied the young man. "There is a work here to do. I am a carpenter—a brother of the order."

Through the little village this religious asceticism prevails. Walking along the little streets one is struck with the large carved wooden crucifixes near the entrance to the doors of many private homes and at the foot of the crosses in summertime will be found vases crowded with wild flowers from the hillsides.

Around the edge of an artificial lake near the college grounds are stations of the cross, at which the old and young may be seen praying throughout the day.

The village has two stores, a blacksmith shop, an auto garage and ice cream parlor and near the edge of the town is a pea canning factory—the only modern industry.

All about the homes are gardens with flowers growing in profusion, and the air is heavy with the odor of roses. In the dark green canopy about the churches and the ecclesiastical buildings, flaming colored orioles were piping and the liquid air was music with insect life. From the honeysuckle and other vines that climbed the garden fences and monastery walls came the murmur of honey bees.

St. Nazianz is happy in its security. It awakens to the carol of birds and the chant from the cloister. It proceeds to its day amid Old World conditions, happy and contented in its peaceful, restful life among the great undulating hills.

And the gold-gleaming cross, on the old pioneer church of the village, bathed in the sunlight of day, looks down "as though it would fall to earth weary of its aged unchangeableness."

New England's Rock of Ages

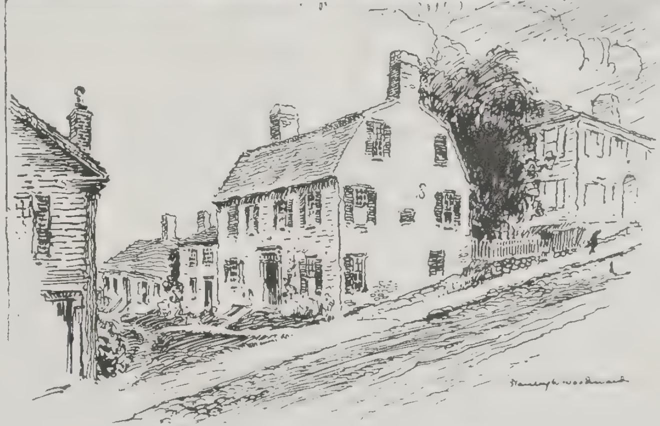
Only Boulder of Its Kind, Brought by a Glacier, Waiting to Receive Pilgrims of 1620

THEY say that nothing is what the sleeping rocks dream of, but when, some eons past, Plymouth Rock slid off a glacier and landed just where the tide would ebb and flow, it seems as if it were premeditating future glory. There it was, the only boulder of its kind for miles around, waiting to receive the Pilgrim feet when on December 21, 1620, they landed on the shores of the New World. And, during the three hundred years that followed, whenever fate has tried to rob it of its honor, a special Providence has apparently directed its downsittings and uprisings.

For, as rocks go, Plymouth Rock has had a very exciting and by no means sedentary time of it. In 1741 men had almost forgotten its day of days and were planning to build a wharf above it. Then Elder Thomas Faunce, ninety-five years old, had himself carried to the Rock in his chair and made solemn declaration that his father, who came over in the *Anne* in 1623, had told him that this was the first landing place and that several of the Pilgrims whom he had known as a boy had corroborated the story. Then, as now, business had little to do with sentiment, and the wharf went on a-building. But as Elder Faunce lived to be ninety-nine, continuing of sound mind and memory, his words gained more and more weight, until, in 1774, when the Revolution was threatening, twenty yoke of oxen were hitched to the Rock and hauled it to Town Square, where it was placed beneath the Liberty Pole. Later it was moved to the front of Pilgrim Hall, where it remained for years, a constant puzzle to tourists, who were amazed to find it so far from the water's edge.

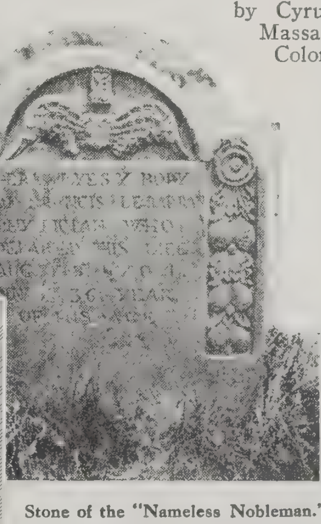
Fortunately, or because of its guiding star, the Rock had split at the time of its first moving, and a substantial portion remained to mark the site. In 1880 it was put back to its original position, the parts cemented together, and it now remains, secure, it would seem, through the ages. A handsome granite canopy, the gift of the Colonial Dames, is built above it, with floor higher than the sea level, so that the stranger in the village, at high tide or low, may visit its chief treasure.

Just above the Rock is the most pathetic spot in Plymouth, Cole's Hill, where, the first winter, half of the Pilgrims were buried and where, in that first spring, corn was planted over their graves to conceal their number. Of that sad time Governor Bradford writes, "Ye welle were not in any means sufficient to attend ye sicke, nor ye living to bury ye dead." Yet there are almost no references to death in his chronicle, except that of good Governor Carver, who, he says, "was buried in ye best manner they could with some vollies of shott by all that bore arms." From time to time inundations of the sea or excavations by workmen have brought to light their remains, which are now deposited in a handsome marble sarcophagus with suitable inscriptions.

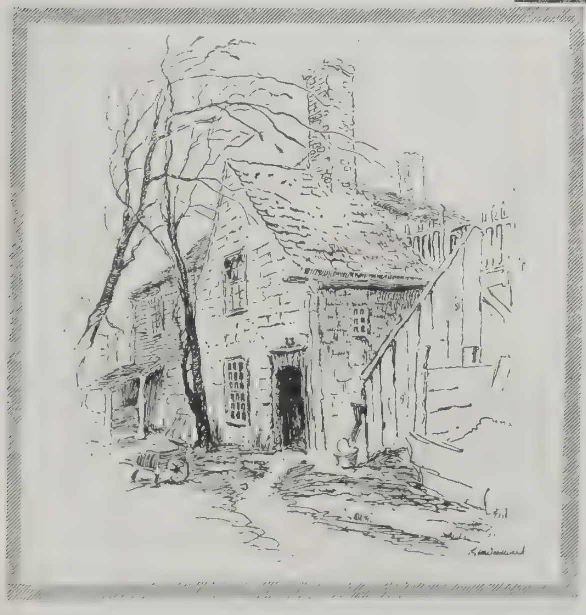


Leyden street, Plymouth, site of first house.

Only a few steps beyond is a statue by Cyrus Dallin of the Sachem Massasoit, faithful friend of the Colonists for fifty years. It would be well if there were a tribute also to Squantum, who was indeed "a spetiall instrument sent of God for their good beyond their expectation." Kidnaped as a boy to be sold as a slave, Squantum had traveled over a great deal of the globe and had spent at least five years in London. When he was finally brought back to his native Cape Cod he found not one of his tribe alive, for all had perished by the pestilence. With the coming of the Pilgrims he attached himself to their number, showed them where to obtain fish and clams, taught them how to plant their corn when the oak leaves were the size of a mouse's ear and to put six herring in each hill, and was "their pilott to bring them to unknowne places for their profitt and never left them till he dyed."



Stone of the "Nameless Nobleman."



Cole's blacksmith shop, dating back to 1684.

The first Pilgrim trail, Leyden street, leads from the water to the hill on which, as the chronicler relates, "we poynt to plant our ordnance." In the registry of deeds is preserved a plan of the street, in Governor Bradford's handwriting, with the laying out of meersteads (so-called from the Dutch) and "garden-plotes of those who came first." Not far from the shore is the site of the first house. This was begun on Christmas Day, 1620, and the following Sunday services were held in the half-finished structure. A little way up the street is the site of Elder Brewster's lot with its spring, still "very delicate" and refreshing to the wayfarer, although today he quaffs it from a bubbler.

Under the brow of the hill the street runs into Town Square where Governor Bradford had his dwelling. The oldest building now is the Town House, built in 1749. Here was erected the first meetinghouse, and its descendant, First Church, is not far from the original site. The handsome edifice is of stone, with arched portals which reproduce to doors of the church in Austerfield, England, where Governor Bradford was baptized. But First Church does not represent the faith of its founders, for, in the controversy of 1801, it declared itself, by a majority of one, Unitarian. The Church of the Pilgrimage, opposite, perpetuates, as the tablet tells us, "the evangelical faith and fellowship of the church of Scrooby, Leyden, and the Mayflower, organized in England in 1606."

Just around the corner from the Square is the site of John Alden's house, and from there we turn up to Burial Hill. Just when it was first used for graves we do not know, but the first mention of it is in 1698 when Chief Justice Samuel Sewall, who was holding court in Plymouth, writes, "I walk out in the morn to see the mill, then turn up to the graves, come down to the meetinghouse, and, seeing the door partly open, went in and found a very convenient place to pray."

This hill, together with the abundance of running water, was the great advantage that induced the Pilgrims to choose Plymouth as their place of settlement. With a watch set on its summit they could be comparatively safe from surprises. As soon as the first, or "common" house was complete, a fort was built and its foundations are still intact, some inches below the sod. And on the very site are two cannon of the selfsame type that the *Mayflower* brought. One, a Minion, bears the date 1550, a rose, and the initials of Queen Mary; the other, a Sakeret, has the date 1555, and is of the time of Edward VI. Both were the gift of the British Government to the town of Plymouth on its tercentenary celebration, and were the only pieces of the period of native manufacture in the British National Museum of Arms.

The fort, "both strong and comly," served as a meetinghouse until a church was built. De Rasieres, who visited the colony in 1627 as an embassy from New Netherlands, gives the following quaint account of their gathering:

"They assemble by beat of drum each with his musket and firelock, in front of the captain's door. They have their cloaks on, and place themselves in order, three abreast, and are led by a sergeant without beat of drum. Behind comes the governor in a long robe; beside him, on the right hand, comes the preacher with his long cloak on and on his left hand, the captain, with his side arms, and cloak on, and a small cane in his hand—and so they march in good order, and each sets his arms down near him. Thus they are continually on their guard night and day."

Near the fort stood the watchtower, and, a few years ago, the caretaker, in sinking a boulder, unearthed its foundations. Part of the brick was deposited in Pilgrim Hall, and

The Ethics and Practice of the Inch in Lumber

It May Be as Shallow as Three-quarters Investigators Learn

By THEODORE M. KNAPPEN

HOW thick is an inch? That may seem a simple and insignificant as well as a foolish question. But it has had the great American lumber industry by the ears for more than a year, and has disturbed it for many years. Volumes of discussion, some of it marked by acerbity, have been poured out by the various lumber making and using industries' associations, the trade papers have teemed with it; and rugged lumbermen have become proficient dialecticians in dealing with the ethical and commercial problems involved. Herbert Hoover has been held up to scorn as a short-measure advocate, and in connection with lumber grading, the thickness of the lumber inch has been alleged to have assumed political significance as a bone of contention between Hoover and another member of the Cabinet. Innumerable committees and sub-committees have solemnly wrestled with it, and history, custom, moral philosophy and practical utility have been cited as witnesses and authorities.

Although the inch has been the unit of measurement of lumber since time immemorial, it is a long time since an inch-board has been exactly an inch thick, and no living builder ever saw a 2x4 or any other "dimension" piece that was as thick as it was designated. Everybody concerned with lumber knew that his boards were not an inch thick or his "dimension" what the price lists said they were. In general, there was no intended or actual deception, and although consumers may have had a vague idea, if they ever gave the subject any thought, that the manufacturers were "putting one over" on them by actually delivering less than the nominal cubical content of lumber shipments, the question would never have been an agonizing one, if the lumber industry, of its own initiative and encouraged by Secretary Hoover, of the Department of Commerce, had not become infected with the current standardization epidemic.

To standardize size it became necessary to establish an actual standard of thickness, and that, of course, precipitated the question of how thick an inch should be in lumber. Up rose the austere puritans of the trade and declared that an inch was an inch, though the heavens fall and the industry crumble. Primarily, they were for having boards an inch thick and dimension in full multiples of a full inch. But if they could not have that they wanted trade nomenclature changed so that if boards were only half an inch thick they would be so described. Their chief apostle charged that the lumber manufacturers had gradually reduced the thickness of lumber to make the consumer pay for the "kerf" or material wasted by the saw in sawing the log. The lumberman, he said, was getting twelve "inch" boards from a twelve-inch log despite the fact that the kerf might waste as much as fourteen per cent of the log, and thus was making the buyer pay for sawdust he neither got nor wanted. After that the thrifty lumberman, so the apostle of one hundred per cent reform charged, dried and surfaced the board, so that even if it was an inch thick when it came from the log, it was as much as a quarter of an inch, or even more, scant when shipped.

Some of the manufacturers were almost as austere as their critic. Their austerity varied inversely with their distance from the market. Northeastern manufacturers were even ready to give a full inch and sometimes did; southeastern lumbermen thought an inch ought to be almost an inch. Southern pine manufacturers considered that twenty-six thirty-seconds was an ample inch for yard boards; while the big-timber lumbermen, out on the Pacific Coast, considered that twenty-four thirty-seconds was about right, except that it might be a trifle too much. Lumber, be it known, while sold by board-feet measurement, is transported by the pound. It materially helped a distant manufacturer to compete in, say, the New York market if his inch-boards were thinner and therefore lighter. The Pacific Coasters supported their position by alleging that the dealers in lumber really preferred a three-fourths (at most) inch, anyway, and that a full inch board was unnecessarily thick for its accustomed uses. But as a whole, the manufacturers agreed that in lumber an inch was not and should not be an inch. At the same time they were disturbed by the obvious fact that what was called an inch wasn't one anywhere by a considerable fraction.

Find Thickness Not Fixed

AT THIS point the historical school of lumber commentators came to the support of the lumber conscience with the grateful argument that originally boards were boards, even as "pigs is pigs," that their thickness was not fixed, but was intended to be enough for the structural purpose. It was pointed out that when logs were cheap and lumber likewise, and planing and surfacing were not done at the lumber mill, it had become the convenient manufacturing custom to make them approximately an inch thick in the rough, but that the ultimate consumer never concerned himself about the actual thickness if it was obviously sufficient for the purposes for which boards are used. These historians, it is true, were countered by others, of a more materialistic mind, who maintained that the scant board started in sharp or careless practice by an occasional manufacturer or dealer, and that finally the custom of scanting all lumber manufactured for the general trade was enforced by the exigencies of competition; but little credence was given to their views.

Then the subtle philosophers of the trade took the historical argument and laid down the plausible rule that in buying boards the buyer was after surface; that is, with length and width being assured, any board he might purchase would be thick enough. Going a step further, they argued that purchasers of "dimension" for joists, rafters, studding and the like were concerned primarily with length, knowing that if the commercial pieces they bought were as long as stipulated they would certainly be wide and thick enough. The only class of buyers who were really and truly interested in all three dimensions were the woodworkers, who needed to know the cubical contents of their purchases—and that class of buyers was already getting actually exactly what it was nominally buying.

The economists and conservationists got into the controversy and intimated that monuments ought to be raised to lumbermen as benefactors of the Republic for getting rid of the tyranny of the one hundred per cent inch in lumber. Conservation of the forests, prolongation of the timber supply and savings to the consumer were dwelt upon as the outcome of lumber thick enough but not too thick. Retail lumbermen everywhere were cited as witnesses that the trade would not accept full inch-lumber. A man made the rounds of the lumber yards of New York and bought seven different thicknesses of inch-boards—all less than an inch.

Quality to Be Standard

THE United States Forest Service threw its hat into the free-for-all, and declared that conservation and utility were a unit in demanding that "inch" boards be thirteen-sixteenths of an inch thick—no more, no less. A larger inch, the service said, Arthur Upson speaking, was wasteful; a smaller one was too weak. The moralists, or some of them, granted the force of all these contentions but declared that the industry must break away from nominal if not actual deception of calling all sorts of contracted inches sure enough inches. And that is why the idea was finally hit upon of calling boards and dimensions of fixed minimal measurements standard boards and standard dimension, especially as it was obvious that while the historians might be right in saying that boards were originally just boards, the growing tendency in recent years had been more and more to call them "inch," even as they fell further and further away from the standard inch.

Between them, the historians, the logicians and the economists and conservationists have carried the day and the inexorable moralists have been mollified, if not entirely satisfied, for the Central Committee on Lumber Standards has voted that a board is a board and that hereafter it shall be so described, plus the word "standard," and not as an inch-board. But after all, ethics, general and historical, having been satisfied, there remained the practical question for standardization purposes of actually determining the thickness of the board that is to be marketed without reference to thickness, but only with reference to surface. Obviously standardization could not be effected without standard measurements. Ethics was also considered and deferred to here. It was voted to be the height of trade morality if the yard or stock board was an inch—a real inch—thick in the "rough green," that is, as it came from the saw, and was not less than twenty-five thirty-seconds of an inch thick after drying and surfacing. Likewise with dimension stuff—inch for inch at the saw—it might be three-eighths of an inch scant in thickness f. o. b. But here it was not found convenient to dispense with dimensional terminology, and a scant 2x4 will be known as a standard 2x4 in the trade, though it is hoped that with all the open discussion that has been going on, and with the explanations the standards code will have, there will be no trusting soul in the United States who will be entitled to be outraged should he apply a tape to a 2x4, or any other specified dimension, and find that it is not what its name says it is.

In justice to a great industry, the industry that still provides the chief structural material of about eighty per cent of all American edifices, it should be added that while the noise of putting the industry on a logical and ethical basis has been chiefly about thickness, real and nominal, it has been but a minor phase of a very difficult and complex trade custom reorganization. Quality and utility grades are to be more definite than ever before—as definite, in fact, as the nature of the material will permit—and they are to approximate universality regardless of species, so that a grade designation will be significant to a buyer, whether he buys yellow pine, white pine, spruce, fir, or whatever wood. These grades are to be adopted throughout the United States, at least as far as the authority of the National Lumber Manufacturers' Association, thirteen regional lumber associations and numerous groups of distributors and users, the approval of the Forest Service (Agricultural Department) and the hall mark of the Department of Commerce can make them. They will be much fewer in number than the present grades, and their names will be such as to convey a definite idea of their quality relativity. There will be no more No. 1's, outgraded by adjectively described refinements. A buyer will not have to take a course of instruction in the grading of a dozen different associations to know what he is buying and whether he is getting what he is buying.

Every Stick to Be Marked

TO PROTECT the inexperienced buyer and the great mass of modern buyers who buy on faith, it is proposed to mark every stick of lumber with its grade, at the mill, and also with an identifying mark which will make it possible to trace its origin, in case the quality or quantity of a shipment is challenged. Grading and inspection will be conducted, as at present, under the auspices of the regional lumber manufacturing associations, but it is possible that in case of a dispute between a buyer and the regional inspectors, there may be an avenue of appeal to the national association, though the lumbermen, in their independence and individualism, are reluctant to go as far as Mr. Hoover wishes and nationalize the whole inspection system.

While they are putting their industry on a sound moral and commercial basis, the lumbermen are planning also to take the useless frills out of the business by reducing the number of grades and classifications of lumber. It is hoped thereby to save labor and material in manufacture and labor, storage and capital in distribution, to the extent of $250,000,000 a year. Further savings are counted upon if it is found expedient to introduce odd and short lengths of lumber in addition to the present commercial even-foot lengths—from eight to sixteen feet—for that will mean more feet of boards to a log, which means timber conservation.

Unless some catastrophe overtakes the rapidly revolving reorganization of lumber as a commodity and as a business, it will be possible a year hence to buy your lumber by telephone or mail, bury old caveat emptor and place your faith in the collective guaranty of the industry.

Beautiful City of the Sun Mystery of the Ages

Concluded from page 7

1,500 tons; but there are more and greater wonders to come.

"The joints between the big stones that were put in position in the rampart wall, to my mind, are even more remarkable than the stones themselves. To illustrate what I mean I took a photograph where two of the stones in the southern range come together. This course of stones was being cut away at the top so as to form a battered surface and on the stone at the right the batter was not finished. But I want to call attention to the joint between the two stones which may serve as an example of all the joints that were made in the rampart walls. What you see in the photograph is a vertical V-shaped groove with polished sides at the place where the two stones are joined together, and the joint, which is at the bottom of the groove, is so fine that it is invisible and can be detected only with a strong magnifying glass. This close contact of the two stones extends from front to back and from top to bottom. I am using no exaggeration when I say that it is like the invisible joint in a polished mahogany table top. It is scarcely necessary for me to add that no mortar or filling of any kind was used in the masonry construction at Baalbek.

"How did they move these stones and lift them into position, and how did they make such joints as those? The question is usually dismissed with the statement that the builders had legions of slaves whose normal energies and resources were, it seems, developed to an astonishing degree by the liberal application of portentous and magic whips, and whose unskilled labor miraculously transformed itself under the same treatment into the most refined and exquisite craftsmanship. That is an interesting theory, but there are objections to the theory of slaves and I find myself unable to entertain it. In the first place it has no historical basis at all. In the second place, Baalbek did not impress me as the work of slaves. It impressed me rather as the work of men who loved their toil and who gloried in the labor of their hands. It impressed me as the work of men who handled their tools with affection and who caressed the marble as they wrought it till it yielded to their touch and responded to their will for the sake of the love that they bore it. In other words, it all impressed me as the work of men who are as extinct today as the giants before the Flood.

"What mechanical devices were used I do not know, but I think it will be agreed that the magicians who juggled with these stones, tossed them about, chucked them up on the top of walls and balanced them on the tops of columns and never thought of mentioning it at all, have furnished us with an interesting standard by which to measure our own performance. But when, in addition to that, they ranged those stones up together with the precision of science and with a cabinetmaker's joints, I confess that I find it a little bit provoking on their part, for it looks as if they were rubbing it in on us.

"While we are looking at the picture let us not miss its full message, lest what we have seen should make us feel too proud of Adam's breed. If this picture shows us on the one hand man, the architect, in action like a god, it also shows him up in action like an insect or a worm. When the builders raised these columns they placed bronze dowels sunk in lead between the base and the foot of each column and some one in the course of time has cut away the stone at the foot of every column to extract the lead and bronze. And yet with only half a foot to stand on, each column continues to bear up its load and has weathered every storm and every earthquake. So long as these six columns stand as they stand today, serene above the warring nations—these valiant sentinels that have braved, age after age, the hostile elements and the violence and rapacity of man—so long will men bear witness that here a miracle was wrought in stone."

The Roman Emperor Theodosius, who reigned at the end of the fourth century, ordered the destruction of pagan temples. The overthrow of Baalbek was then started, and was carried on for centuries.

Desert Baby of the Union Seeks the Sea

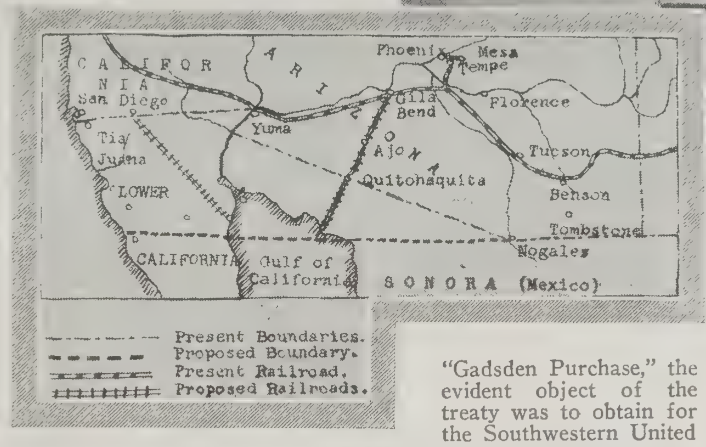
Arizona Would Have Port on Gulf of California, With Colorado River Within the United States

By HARRY H. DUNN

ARIZONA, the baby of the forty-eight states, is putting the force of her civic and commercial organizations and her government behind a project to provide herself with a port on deep salt water, thereby permanently retiring from the twenty-seven inland states, and to place the Colorado River entirely within the boundaries of the United States. By joint resolution of her legislature, and by similar resolutions of her commercial and other organizations, supported by the approval of the Arizona and California River Regulation Commission, Arizona is seeking to purchase, or to have the national government purchase, approximately 9,500 square miles of land from Mexico to be added to the 114,000 square miles now embraced within the boundaries of our youngest state. Arizona is now as great in area as Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York and New Jersey combined, and the 250,000 or so persons now living in the state are not seeking more land, but are demanding a way to the sea for their steadily and largely increasing production from mines and farms.

Right—Central avenue, the main business street of Phoenix, Arizona, whose business organizations are the principal movers in the plan to give the state a seaport on the Gulf of California.

This map shows proposed extension of the southern boundary of Arizona. The purchase of these lands from Mexico would place the Colorado River entirely within the United States and would give the United States two ports on the Gulf of California.



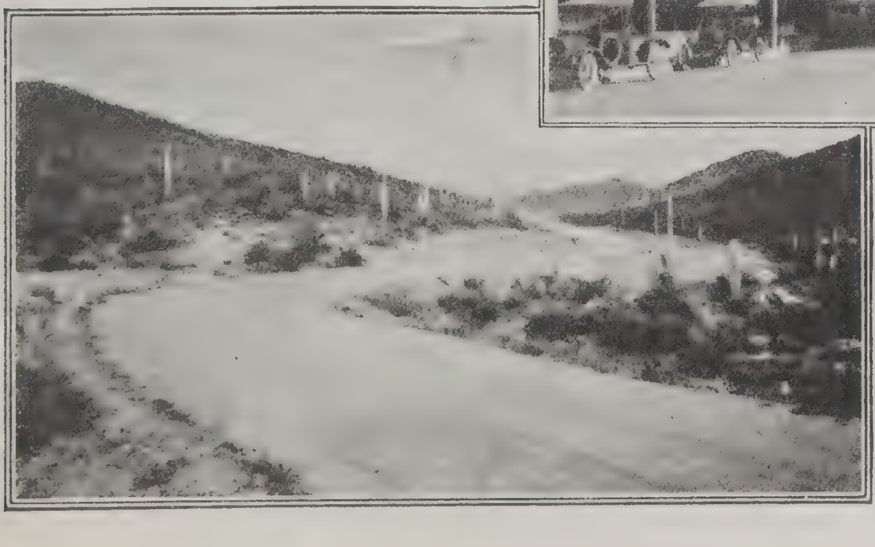
It is proposed to continue the southern boundary of Arizona, from its present western end near Nogales, to a point ten miles west of the western shore of the Gulf of California, this point being on the peninsular state of Lower California, Mexico. In addition to this, a movement is gaining headway in California to purchase from the national government of Mexico the land lying between the present southern boundary of California, and the proposed new southern boundary of Arizona in Lower California. This extension would give to the United States ownership and control of the Colorado River from its headwaters to its mouth in the Gulf of California, or, rather, its several mouths, there being four or five channels by which this variable stream finally gains salt water. Such acquisition of land also would give to the United States ownership of the Gulf of California for approximately fifty miles from its head, taking in Montague Island and Adair Bay, and giving deep water direct to the Pacific Ocean some hundreds of miles below.

Surveys for the construction of a railroad have been made from Ajo, in Arizona, to a point on the eastern shore of the Gulf of California selected as the site of Arizona's port. It is quite probable that this railroad eventually will be constructed and the port established, even though Arizona does not obtain the wished-for addition to her area, since the national government of Mexico is understood to be favorable to the project. On the Lower California side of the gulf, surveys have been completed for the construction of a railroad approximately sixty miles in length from Mexicali, capital of the Mexican state, to deep-water on the Gulf of California, where a port also is to be established. These surveys have been made by the Mexican Government, and it is generally known, though not officially announced, that the Southern Pacific in Mexico will build the railroad, and the terminal facilities at the proposed port. Should the attempt to add the Mexican territory to California fail, the railroad will still be built, and the port established, to handle direct to shipside the large agricultural production, especially cotton, which has been developed around Mexicali.

The question of an American port on the Gulf of California is three-quarters of a century old, and it appears that now one of the errors of the treaty by which the southern boundary of the United States was fixed is to be rectified, to the benefit of all concerned. When the then Senator Gadsden, of Alabama, was sent by President Pierce to make the negotiations with Mexico which resulted in the "Gadsden Purchase," the evident object of the treaty was to obtain for the Southwestern United States a port or two on the Gulf of California. If Gadsden had arranged, as he had the power and the opportunity to do, an agreement to carry direct to that gulf the line between the thirty-first and thirty-second parallels of latitude, which was followed part of the distance, he would have accomplished the real objective of his mission. But neither geography nor topography of that region was so well known then as now, and Mr. Gadsden permitted the Mexican members of the treaty-making party to shift the course of the new international line at a point about four miles west of what is now Nogales, from a direct east-and-west tangent to another running northwesterly, coming out near Yuma, and leaving the head of the Gulf of California at least thirty miles to the south, well within Mexican territory.

Oval—Salmon from the Gulf of California, caught by members of a party of Arizonans following the proposed new southern boundary of their state.

Above—The heart of Tucson, Arizona, a city which will be largely benefited by the giving of a seaport to one of the interior states of the Union. Photo shows Stone avenue, one of the principal business streets.



Left—The main highway from Tucson to the present southern border of Arizona. In the distance are the mountains of Mexico.

Why this purchase and treaty were consummated before a complete survey had been made remains one of the many mysteries of diplomacy. To this day many people believe that Senator Gadsden performed a creditable service when he closed the purchase which bears his name, but, as a matter of fact, he was adroitly "jockeyed" out of the main object of his mission—contact with the sea in the Gulf of California. This is what Arizona and California seek to restore, particularly Arizona. The land to be included in the proposed extension of Arizona's boundaries is not particularly valuable. It is a part of what was originally known as the "Papagueria"—the Land of the Papagoes—and is today inhabited mainly by Indians settled in small *rancherias,* cultivating relatively small areas, and doing nothing to improve or develop either soil or living conditions. With abundant water for irrigation, much of this land could be developed agriculturally, and there are known to be mineral deposits of size in it, though at present these deposits are too far from highway, rail or water transportation to offer an inviting field to mining men.

The purchase of this triangular piece of land by Arizona would create a new coast state and remove an inland state from the present twenty-seven. The land itself is approximately two hundred and forty miles long by fifty miles wide at its widest part. As soon as a railroad is laid, Arizona will be able to ship her mining, agricultural and cattle range products direct to the markets of the world by water, without being dependent on car-supply or transcontinental railroad rates. An area about thirty by forty miles is covered with a very ancient lava flow, and with hundreds of extinct volcanic craters. There are also many square miles of sand dunes on which nothing grows or will grow. That is to say, much of this area is waste land, but there is also much, probably two-thirds of the entire terrain, which is comparable with the Salt River Valley, or the Imperial Valley, as to soil. The prospects for development of this land by Mexico are small, but, should it become a part of the state of Arizona, the same procedure would be followed that has made of the Salt River and Gila River valleys productive garden spots in the midst of a desert similar in every way to that south of the present international boundary.

The Gulf of California is probably as little known as any arm of the sea anywhere in the world. Even the Mexican Government has no complete maps of the region. Not only is the coast line and the surrounding land undescribed, but the depths of water and navigable channels of the head of this gulf are not well established. The hunter, explorer, photographer and fisherman who cares to take to the Colorado in a flat-boat at Yuma, and float down to the several mouths of this greatest of the many "Red" rivers, will find a country which has been shot over but little, photographed not at all, and explored almost as little, while, according to the Indians who go down to the coast for salt, the gulf is filled with game and edible fish.

On the California, or western, side of the Gulf of California, the country is rather better known, the soil better, and conditions considerably more advanced than on the eastern side. Some 200,000 acres of land are in

(*Concluded on page 12*)

A Ten Million Dollar Gift to Coal Operators

Pinchot Plan Quickly Adopted When Analysis of Figures Reveals That Settlement Means Just So Much More for the Owners

By WILLIAM A. M'GARRY

HOW did Gifford Pinchot, governor of Pennsylvania, succeed in getting the anthracite operators of Pennsylvania to grant a flat ten per cent wage increase to the hard coal miners who went on strike September first? Other men have acted as arbitrators between operators and miners in recent years, but the only settlement ever made has been based primarily on the maintenance of the status quo. United States Senator Pepper brought about such a settlement in 1922. It didn't cost the operators a cent. The Pinchot settlement undoubtedly represents an increase in the labor cost, and even though it is generally agreed that the public will pay this increase in the long run, Pinchot's friends and press agents are trying to hail him for the "exploit."

At the same time others, who either do not know or do not care that sixty-five per cent of the miners earned only $4.20 a day under the old rates, bitterly denounce Pinchot on the ground that the settlement represents a betrayal of the public to the miners. Some newspapers assert that anybody could have settled by "giving in" to the workingman. But who has said anything about the surrender to the operators? The surrender to the operators was an essential part of the Pinchot settlement, without which it could not have been made.

Translating that surrender into terms of dollars and cents, it means a little gift of ten million, four hundred thousand dollars a year to the anthracite operators. The term of the contract signed under the Pinchot agreement is for two years, so that the reform governor of Pennsylvania has made it possible for the operators to collect twenty million, eight hundred thousand dollars over and above the inflated profits now being taken out of hard coal, during the next two years. And those figures are based on statistics supplied by the operators themselves, so that in all probability the Pinchot award will be very much higher.

Where Loophole Lay

ONE of the figures is the average wage in the anthracite industry. On August 22, when negotiations between miners and operators had come to a deadlock in Atlantic City, the following statement was issued by Samuel D. Warriner, president of the Lehigh Coal and Navigation Company and spokesman for the operators:

"The present wages are entirely adequate and are adjudged so by the United States Coal Commission. The Department of Labor has estimated that the average yearly income of the 155,000 mine workers, contract miners and day laborers alike, not including the boys, is $1,832. You will go far in any basic industry to find wages anything like that."

On August 29 Governor Pinchot made his famous peace proposal, calling for the ten per cent increase. And well down in the body of his official statement he put the following paragraph:

"The ten per cent wage increase, according to the best figures available to me, will add sixty cents a ton to the cost of domestic sizes of anthracite coal at the mine. Of this amount not less than ten cents can be and ought to be absorbed by the operators without any increase of price. In the last three months of 1922 and the first three months of 1923 their profits have been greater than ever before in their history. But the extent to which these producing conditions will continue no one can now predict with confidence. The remaining fifty cents a ton should not in the end be taken from the consumer. The whole of it can easily and properly be taken out of the cost of transportation and distribution."

When the miners and their leaders saw the foregoing paragraph they recognized it instantly as the "loophole" for the operators. "Sixty cents a ton" was to them nothing more nor less than a gift to the owners of the mines. Therefore they were not in the least astonished when the operators said it was too low, and came back with the assertion that the actual cost of a ten per cent wage increase would be seventy-five cents a ton. This stand made the governor's figure look good.

Any citizen can figure it out for himself. Governor Pinchot did not need any but the simplest statistics to find out what it would cost to increase mine wages ten per cent. He had, first, the average wage, estimated by government experts, or rather definitely calculated. He knew, or could find out, that average normal production is 65,000,000 tons. Repeatedly he referred to the 155,000 miners, so that he knew their number.

Sixteen Cents—A Small Matter!

IT IS quite likely that the operators will say a computation cannot be based on these figures, because mysterious "other factors" enter. But it will be shown that wherever figures are not exact, it is more than likely that the exaggeration is in favor of the operators. For instance, it would be interesting to know just how many unnecessary employes—superintendents and the like who never go into the mines—were included to get the average wage of $1,832 a year.

Passing that for the moment, however, it is quite plain that if the average wage is $1,832 a year and the total number of workers is 155.000, the total annual wage payment of the hard coal industry is merely a matter of multiplication, or $283,960,000. In other words, it costs that much for the operators to get sixty-five million tons of coal, according to the figures they have submitted. Now divide the wage total by the tonnage, and the result is approximately $4.37, which is the labor cost a ton—based on the figures of the government, endorsed and accepted by Mr. Warriner in his Atlantic City Statement of August 22, and on known and familiar statistics of production and number of miners.

The estimate of sixty cents becomes illumined at this point. Bear in mind that the sixty cents is a ten per cent wage increase. But ten per cent of $4.37 is not sixty cents. It is only a fraction over forty-three cents —call it forty-four to favor the operators. Sixty cents is ten per cent of six dollars, and when Governor Pinchot announced that a ten per cent wage increase meant sixty cents a ton, he gave official authority for a higher cost than operators had ever claimed.

The difference between forty-four and sixty cents is sixteen cents—a small matter. But multiply it by 65,000,000 tons. The resulting sum is $10,400,000. Multiply that by two for the life of the contract and the result is $20,800,000.

It has been shown in this magazine that operators are no longer finding a ready market for 65,000,000 tons, and it may be that the demand is less. But the $1,832 average wage calculation was based on a normal year of 65,000,000 tons.

Last year, when the operators were resorting to every device to prove the high cost of digging coal, the best they could show was a cost of considerably less than five dollars a ton. The miners contradicted that figure and put it below three dollars a ton. But now the governor of Pennsylvania has outdone the operators by placing it at six dollars! And now the operators snatch for more and say the cost of the increase is seventy-five cents a ton! That is equivalent to saying that it costs $7.50 to produce a ton of coal under the old schedule, and will now cost $8.25!

There is still another phase of the business that is worth looking into. The coal year starts April 1. The mines closed on September 1, having operated five months of this year. *In that time, according to repeated admissions by the operators, about thirty-two million tons were mined.* This is considerably above the annual normal average of sixty-five million tons. It is, to be exact, 6.4 million tons a month, or seventy-six million tons a year. If the calculation of cost a ton be based on that figure it will be seen that the difference between that cost and the estimate made by Governor Pinchot is even larger, and the gift made by the governor to the operators consequently some millions higher.

The Coolidge Telegram

AFTER the settlement had been made the whole country laughed over the attitude of Governor Pinchot in refusing for a time to make public the telegram of congratulation from President Coolidge, apparently for the reason that the President stated therein that he had "asked the co-operation" of the governor. Newspapermen, acting as intermediaries, finally got official approval from the President for the publication of the telegram, and Pinchot was in reality forced to release it. It was plainly a case of the governor's seeking "credit" for his settlement.

The settlement, as has been shown, was in the nature of a gift to the operators. It gave the miners something. Generally it has been referred to as *a compromise,* and the newspapers have called it the "Pinchot Plan." But was it? One of the unwritten stories of the strike settlement is known to all the newspapermen who were in Harrisburg during the negotiations. It was a matter of common knowledge that the United States Coal Commission could never get a settlement with the miners, because the miners felt that they had been betrayed by the earlier commission, of which John Hays Hammond was a member.

When the deadlock came most of the newspapermen in the confidence of the miners' leaders knew their rock-bottom terms, just as they knew early last year that the miners eventually would go back for the old wage rate. These terms, containing the compromise on check-off, the fifty-fifty split of the wage demand, and other items, are said to have been carried to Pinchot. Nothing remained then but to show the operators how to collect, and this was done to the queen's taste by the sixty-cent estimate. When, later, Governor Pinchot recommended to the President certain steps to reduce freight rates, he was some months behind, for the Coal Commission had made the same recommendation and the necessary governmental machinery is already in motion.

The Coal Will Back Up

IN HIS references to the possibility of the retailers absorbing some of his "sixty cents," the governor did not quote the exorbitant mark-up awards granted by the United States Fuel Administration during the war. These awards were made to meet an emergency, during which every pound of coal that could be mined was needed for war purposes, and coal for domestic consumption was rationed. In Philadelphia dealers had been doing very nicely on less than two dollars a ton mark-up over the combined wholesale and freight rate cost. The coal administration gave them $2.50, which was more than they asked. Since then it has been increased by action of the retailers. In some cities it is considerably higher.

A curious feature of this increase is the fact that a movement has been well under way in all large cities for some years to reduce the number of individual dealers. All sorts of mergers have been accomplished, always accompanied by publicity to the effect that big corporations can operate with reduced overhead and greater profit through increased volume. So far, however, instead of passing on to the public some of that increase, the retailers have been shoving up prices wherever possible. Thus in the present case if the operators succeed in adding seventy-five cents a ton to the exorbitant prices granted last year by the Pennsylvania Coal Commission, retailers, wholesalers and coal sales agencies all will take a "handling charge" with the result that the ultimate consumer will be lucky to get out with an increase of a dollar a ton—unless a glut occurs.

Chances for cut prices, however, exist. The mines are operating. Thirty-two million tons, more than half the normal demand, were mined before they closed. If consumers will refuse to be driven into a shortage scare by the newspapers, sooner or later the coal will begin to back up in the yards of the retailers, and the inevitable law of supply and demand will begin to operate.

Desert Baby Seeks the Sea

Concluded from page 11

cultivation just below the border, and more than half a million acres more are being prepared for irrigation and cultivation. Due to the production now being taken from these lands, and the consequent income to the government of the Mexican state in the shape of taxes, there probably will be considerable opposition on the part of the people of that district to the sale of this strip of land to the United States. No such reason to prevent the sale is to be found on the eastern side of the Colorado River and the Gulf of California, however, and indications are that, sooner or later, Arizona will be able to win a port for herself on deep salt water.

The Arizona and California River Regulation Commission, as long ago as 1914, through its advisory board, adopted resolutions that "the United States should honorably acquire from the Republic of Mexico a sufficient quantity of land bordering the Colorado River to place that river entirely within the territory of the United States," because, primarily, "through the industry and enterprise of the citizens of California, Arizona, Nevada, Utah, Colorado and Wyoming, enormous values have been created by reclaiming lands from their desert state by the use of the waters of the Colorado River and its source and tributary streams, and thousands of homes have been created . . . . all of which are affected in greater or less degree by the uncertainty as to rights in the water of the river which may be claimed by Mexico, as a result of the fact that, before entering the Gulf of California, the river flows through Mexican territory."

The Arizona Legislature's joint resolution to give Arizona a seaport and afford her people harbors for direct commerce with the ports of the world, urges that the President of the United States be "authorized and requested to enter into negotiations with the Republic of Mexico for the purchase by the United States for the area described as follows:

"That strip of land or portion of the Republic of Mexico, in the state of Sonora, lying between and embraced within the following indicated lines through the domain of Mexico, namely: A line drawn from approximately the southeast corner of the state of Arizona, to the north shore of the mouth of the Rio de la Asuncion; thence directly west to deep water in the Gulf of California; a line drawn from the southwest corner of the state of Arizona directly west across the Colorado River to a point in the peninsula of Lower California, ten miles distant from the west bank of said Colorado River, ten miles distant from said west bank all the way to deep water in the Gulf of California."

Owing to the unsettled condition of Mexican affairs and the somewhat uncertain relations persisting between Mexico and the United States when this joint resolution was adopted, it was allowed to lie dormant, but today, with prospects of better conditions within Mexico and improved foreign relations on the part of the Mexican Government, the project is being brought forward again by the state government and the various active organizations in Phoenix, Tucson and other parts of the southwestern state. The California project has not reached the advance stage attained by the Arizona plan, and so far is merely in the hands of various civic, commercial and similar organizations. Preparations are being made, however, to present it to the next session of the California state legislature, so that it may be brought officially before the United States Congress at its coming session.

The result has an important bearing on the development of all water and power projects connected with the Colorado River, and on the future commercial advancement not only of Arizona and California, but of other states through which the Colorado flows. With an American port on the Gulf of California, improvement of the Pacific coast of Mexico also would be aided, and there is a considerable faction in Mexican national life which believes that both these sales should be made, and the international boundary put where it apparently was intended to be at the time the Gadsden Purchase was consummated.

Things That Go to Make Failure in Our Universities

"You Cannot Fasten $20,000 Education on $20 Boy" Leads to Inquiry That Reveals Startling Facts

By ROBERT MORGAN

THE doors of the institutions of higher education have swung inward to admit one million boys and girls. Approximately one-half of this number will not complete the courses offered by the colleges and universities they are attending. Nearly one-third will be dropped, will leave of their own accord, or will be held back for a year by failure to make the grades necessary within the freshman and sophomore years of their college life. Depleted finances, marriage, illness, loss of parents, and other apparently uncontrollable and usually unavoidable causes will account for approximately thirty-five per cent of these, according to educational experts in the higher branches of study.

But there still will remain an overwhelming number who will fail to complete the work of the college or university for reasons entirely under the control of either the university or college, or the student himself. Three reasons are assigned for these failures, which annually cost the states of this Union millions of dollars in the state universities alone. These reasons are:

First, inadaptability of the entrant for college work.

Second, incomplete or inadequate preparation of the student by the preliminary schools, notably the high schools.

Third, failure of the college or university to place the boy or girl in those courses of study for which he or she is best adapted or prepared.

Educational experts claim that by far the greatest number of the failures in our universities—failures made at great cost of time and money to student, parent and school—are due to the first of these causes. David Starr Jordan, former president of Stanford University, coined an epigram on this subject, when he said: "You cannot fasten a $20,000 education on a $20 boy."

Would Eliminate "Misfits"

THE belief is rising that part of the unfitness and inadaptability of the boy or girl for college education is due to lack of proper preparation in the high school; that the high school attempts to give the pupil a smattering, rather than an adequate preparatory knowledge of the fundamentals. For this reason, second place in the causes for the failures of our boys and girls in our colleges is given by educators to the courses taught in our high schools.

Heads of preliminary schools, presidents of universities, alumni, and even men and women who are not college graduates, hold that the university of today, with its wide range of subjects, and the freedom allowed the entrant in selecting his or her line of work, is seldom at fault when the boy or girl fails to make the necessary standing for completion of college courses. That is to say, the third of the causes listed above is responsible for the smallest number of college and university failures.

So great, however, has the problem become, regardless of its causes, that universities and colleges are engaged seriously in finding out just what percentage of their students are actually benefited, how many are fitted by nature, training or adaptability for college work, and whether it would not work to the advantage of the students to eliminate those who are "misfits."

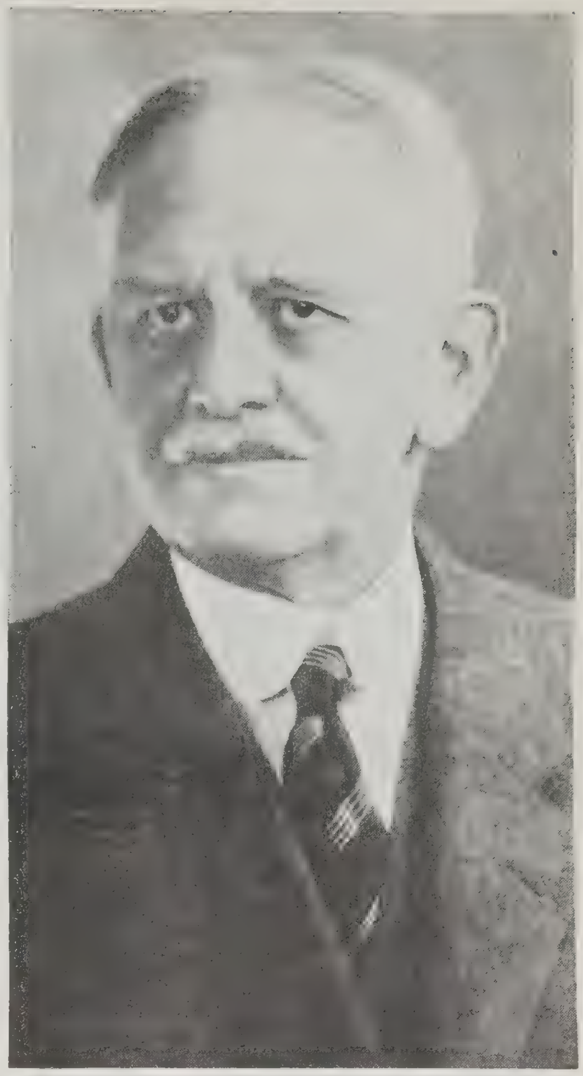
Dr. Charles Mills Gayley, who has just retired after more than thirty years at the head of the English department of the University of California, and who devised and helped to put in practice the system of accrediting high schools of the state to the university, has come to the conclusion that the majority of our colleges and universities are merely "glorified high schools"; that the system of accredited high schools has outgrown its use; that there are so many high schools that there is no opportunity for proper collegiate or university supervision over them, and that a large part of almost every college student body in the United States never should have been sent to college. Dr. Gayley's conclusion is that those who go to our universities improperly prepared, and those who go for any purpose other than to obtain academic results, should be eliminated.

"Fully one-third of the students now at the University of California," says this noted educator, "do not attend college with academic aims and are not prepared to carry out those aims. State universities throughout the United States may be classified as 'glorified high schools.' Too many students go to college because they are 'sent' there by their parents, and not because they really want to go. These misfits should be eliminated. The system of high school preparation for college is inadequate and antiquated, and thousands of dollars are wasted annually on these misfit students because of the present inadequate preparation given to your boys and girls by our high schools. But back of all this is the fact, as Dr. Jordan has said, that 'you cannot fasten a $20,000 education on a $20 boy.'

"In my opinion, there are two remedies for this condition: One, the abolition of the present high school accrediting system, whereby graduates of accredited high schools may enter the state university without taking any examination; the other, the adoption of college methods now in use in Great Britain and in other European countries, of more intensified studies, smaller classes, and a standardization of the university curriculum.

Conditions Are Changed

"MY REMEDIES are offered, not as a criticism of the loyal efforts made so far by our university and high school authorities, but as a constructive method by means of which the university and the schools may meet the changed conditions of the present time. The accrediting system, which I myself had a hand in creating, and which has done so much to build up the schools and to supply the university with good students in earlier years, must be abolished. My reasons for this are that as long as the number and size of the schools were small, it was possible for the universities to supervise carefully classes and methods of study, as well as attainment of pupils. Now that there are hundreds of such high schools, and tens of thousands of pupils, this is impossible, and has been impossible for a long time past. The university cannot send to each high school four or five experts in each branch of study for the careful investigation of each school. Further than this, many schools have now reached the position where they will enjoy more freedom, and will be better able to push their scholars to a higher degree of scholarship, if they are placed entirely upon their own responsibility.



DR. CHARLES MILLS GAYLEY,

For thirty years head of the English department of the University of California, who says that half the students in American universities are "misfits" and should be eliminated.

"It is too much to expect that even the most righteous disciplinary teachers, principals and superintendents will be able always to resist the indirect pressure exerted by parents to assure the accrediting of their children as students to the university. The time has come when the university should abolish the accrediting system, and examine every applicant for admission to the university in every subject which he or she contemplates pursuing at the university. These examinations can be held by delegates of the university at the various towns concerned, and the expense will be no greater per pupil than under the present system.

"The imperfect preparation of many pupils is attested by the fact that year before last, the English department of the University of California spent $20,000 in the training of the elements of English composition of pupils many of whom were accredited by the public high schools. This is only one instance of the present over-grading and ineffective condition of the accrediting system.

"Not only will the universities be relieved of the responsibility laid upon them, and of the large expense involved in the testing anew all through the first term of the year, and the unpleasant duty of dropping the pupils at the end of that time, but the superintendents, principals and teachers of our high schools will be greatly relieved if, having done their best to prepare pupils for college, the responsibility of demonstrating their fitness to enter the higher institutions of education is laid entirely on the shoulders of the pupils themselves.

Need Continental Systems

"I SUGGEST also that only such pupils be received at the university as are thoroughly prepared to undertake the work offered, and, furthermore, are *extremely desirous, first and foremost, to pursue academic aims.* Our universities should proceed to abolish the wasteful and ineffective methods that I call 'glorified high school' recitation classes, and adopt instead the system of the British and Continental universities, of throwing responsibility directly on the students. If the student is not truly desirous of learning, he does not belong in a university; if he has not ambition enough for his classes to attend the lectures and gather therefrom material for his examinations, he should be eliminated in favor of the student who is so desirous of acquiring an education, and whose ambition is great enough to impel him to learn without being herded into a class.

"Conditions prevailing under my observation at the University of California are similar to those at other universities and colleges throughout the United States. The maintenance of our colleges as 'glorified high schools' is costing the people of the several states at least three times as much as it should to maintain these institutions were responsibility for the getting of an education put directly on the student."

Lifting a Tramp and Bootblack to Knighthood

Concluded from page 2

smith from Australia, became "Ruddy Robert" and "Freckled Bob" and the "mauling smithie." But Fitzsimmons had a great deal of personality and was what the public calls a "character." The writers had an easy task with him, for Fitzsimmons was always good copy.

Jack Dempsey the original, whom they called "The Nonpareil" and whom Fitzsimmons defeated for the middleweight title, worked side by side in a machine shop with Jack McAuliffe, the only man that ever held the lightweight title and retired undefeated. In their days of manual toil they both led a humdrum existence with nothing to mark them as individuals apart from their fellows at the benches of the shop. Stanley Ketchel, probably the greatest of all middleweights, was a waiter and Kid McCoy, another national hero, was a hobo who got his start in boxing by landing a job as cook in Fitzsimmons' training camp.

From similar beginnings came the leaders of the lightweight class of boxers. George (Kid) Lavigne worked in the salt blocks of Saginaw, Michigan. Joe Gans, a Negro, who is considered to have been the greatest lightweight of all time, opened oysters in a colored saloon in Baltimore. Ad. Wolgast was a bootblack in a barber shop in Cadillac, Michigan, when he began boxing. Battling Nelson was a waiter in St. Paul. Then he was a waiter in Minneapolis. Then he got a job waiting on tables in Montana.

But each of these men of various weights, colors and creeds has been or is one of the most discussed men in the United States and their fame has spread to all the other English-speaking countries and to many of other tongues. They are national idols with us but they are distinguished abroad as well. The great men of the many arts and professions can command neither the salaries nor the recognition that is paid these men of whom few have had even the simplest schooling. Why?

Among those who saw Dempsey and Firpo battle in New York before more than 80,000 and while one-fourth that number were vainly trying to get in, was Mrs. Lydig Hoyt, a social leader and recognized as one of America's most beautiful women. It was the first time that she had seen a boxing match. Writing her impressions the following day in the New York *World,* Mrs. Hoyt said:

"I have learned from the extraordinary thrill of this fight the reason for the gigantic interest boxing is coming to hold on all sorts of people.

"What a spectacle it was! What a picture that First Ninety Thousand of America's fight fans made! Like a colossal emotional orchestra they sat in their serried rows, low and high, on all dim sides, their entire attention riveted on the blinding square of snowy light and its two struggling heroic figures, the focal point of the whole huge picture.

"It was over. The lights in the great black arena flashed on again. Jack Dempsey remained champion—and in my opinion he had certainly proved himself deserving of the title."

And that may explain why.

Making Capital the Servant of Labor

Farmer-Labor Politico-Economic Program a Romantic Undertaking

By GEORGE T. ODELL

CERTAIN political phenomena that have become manifest during the last two or three years have puzzled not only the plain citizens of America but most of the professional politicians as well. The resurgence of liberalism following so quickly upon the heels of the landslide that swept standpattism into power; the cohesion of landowning farmers with the wage-earning industrial laborers in political action under various banners and in widely scattered sections of the country; the authoritativeness with which the revolters from party discipline have assumed to speak, is well-nigh incomprehensible to politicians of the old line and a cause of wonderment to the public. So for the most part they put it down to the unsettled condition of the world and let it go at that. Officeholders who guessed wrong in thinking that the conservative policies and the discipline of the party machine would last for another decade at least, are scrambling about in a maze of new issues, about which they know next to nothing, trying vainly to get back into the good graces of their constituents.

It might help them if they knew that there is a hidden mainspring that controls the political movement which they see but cannot understand. The key to that spring is held by a small coterie of trades unionists who, having visualized a new industrial era in which productive industry will be financially controlled by the workers, are bending their energies and applying their resources to that end. Political action is one of their instruments—not the most important, perhaps, but nevertheless during the last three years they have seized the opportunity afforded by the unrest in various sections of the country to consolidate their political forces.

Financial control of industry by the workers is so novel in the modern conception of industrial development as to be almost incomprehensible to the average adult of today who has grown up in an atmosphere of capitalistic monopoly, although in reality it is but the evolution of the principle which governed the earliest beginnings of industrial enterprise. The methods and instrumentalities which this group of adventuresome trades unionists is employing to consolidate the financial resources of labor for the purpose of wresting control of the industrial plant in America from the capitalists, is described in a recently published book called "Labor's Money" by Richard Boeckel, to whom I am indebted for the information I have used in arriving at the political deductions herein contained. Whether these men succeed or fail, they are writing one of the most romantic chapters in the politico-economic history of the world. They aim at a pinnacle that is far beyond the ken of most of the capital monopolists of the world, for they seek to secure from the products and emoluments of industry the greatest good to the greatest number of people.

The number of those who are fully initiated into the secret purposes of this movement is small. Probably not more than a dozen men are cognizant of the ultimate goal, but in that group two men stand out prominently in the leadership: Warren S. Stone, president of the Brotherhood of Locomotive Engineers, and William H. Johnston, president of the International Association of Machinists. Senator Robert M. LaFollette is perhaps the chief political strategist of the coterie that has successfully directed and manipulated political forces during the last three years to the discomfiture of professional politicians in a number of states. Yet, in spite of the intense interest the American people have taken in the unfoldment of the political drama, its real significance remains for most of them an impenetrable enigma.

Labor Banks Part of Program

THE methods employed by the coterie to gain their ends are not predicated upon a violent or sudden *coup d'etat,* nor do they involve fundamental changes in the established industrial, financial or political policies. They have taken their lesson from the history of industrial development in America and other democratically governed countries and are consolidating the resources of industrial and agrarian workers to the end that they may acquire control of key industries and furnish the credits necessary to carry them on. Steps in this direction already have been taken. Since the spring of 1920 more than a dozen labor banks have been established with resources of more than $30,000,000. Large insurance funds are also at their disposal for investment, and latterly they have entered the field of the investment bankers in underwriting new or rehabilitated industrial and commercial enterprises. Plans now under way, if successful, will more than triple their financial resources during the next year.

In the political arena this group has appropriated likewise a part of the code which capitalists long ago adopted. They have need for a strong voice in government, national, state and local, to help them carry out their plans. In the political unrest with which a large part of the American people is seized today this group of men has found opportunity to procure the election of men to Congress and to state and local offices, who will be amenable to their purposes. They have grasped that opportunity to consolidate their political forces. In Minnesota, Wisconsin, North Dakota, South Dakota, Montana, Washington, Nebraska, Iowa, Colorado, Oklahoma and Pennsylvania they have gained a measure of what they sought by political action. They will carry on the campaign in many other states next year. Whether they will attempt to enter the Presidential election as an independent political force is not decided and it will depend upon circumstances that are more within the power of the professional politicians than themselves to determine.

The machinery through which the coterie conduct their political campaigns is intricate and intensely interesting. The instrumentalities are so diversified that to the public eye there does not seem to be any connecting link and the political reactions that have been brought about appear to the public mind like spontaneous uprisings. It has been said recently that the people do not know what they want, but certainly this particular group, led by Stone, Johnston and LaFollette know exactly what they want and they have a firm grasp upon the invisible strings that control these instrumentalities.

The National Council for Progressive Political Action is one of their instruments. It brings together farmers and wage workers and even some of the more cohesive independent political groups, like the Socialist party, in national conclaves such as have been held in Chicago and Cleveland. It brings these same forces together even more intimately in state conventions. It rigorously excludes the extremists and the agitators, and so far it has declined to commit itself to more than a general platform acceptable to all classes of the type it aims to amalgamate. So far, the coterie in charge have closed their ears to the siren call to strike out as an independent political party, preferring the safer method of assisting candidates whom they believe to be friendly to their purposes, no matter what party label they may wear.

Certain large trade unions unaffiliated with the American Federation, and several state and city federations of labor, are important cogs in the machinery which this coterie has set up, and provide the means for getting mass political action at a minimum of expense. Upon these sources the coterie has also drawn heavily for campaign workers and for considerable sums of money to use in political action.

Another one of the instruments which this group can command is the People's Legislative Service, of which Senator LaFollette is the head. That organization is equipped to supply material to be used in political campaigns as well as for the liberal propagandists in Congress, and on several occasions it has been useful in bringing together groups of politicians to unite them on a program of action. It was the People's Legislative Service which called the conference of progressive Senators and Congressmen at the beginning of the last session of Congress, and the same organization engineered the conference on railroad valuation held recently in Chicago.

The Farmers' National Council is still another instrument which this group can command for political action. That organization is composed for the most part of small, heavily burdened tenant farmers and farm owners, whose contributions toward its support are necessarily meager. The coterie supplies the deficit and helps pay the salary of its managing director. The Farmers' National Council has been quite successful in stirring the western farmers into active revolt against the old political order.

At one time Mr. Johnston was head of the National Farmer-Labor party, but he withdrew from that position after the Cleveland conference last December, when John Fitzpatrick and Robert M. Buck, members of the national committee, tried to force the Council for Progressive Political Action to go on record for the third party. They nearly succeeded in splitting up the Cleveland convention, but since then the Farmer-Labor party has been practically ruined by the extremists who got control of it at the Chicago convention last July. It was those same extremists, William Z. Foster and his followers, to whom the coterie refused admission at the Cleveland conference. Nevertheless, the men who constitute the leadership of this movement for worker control still use the Farmer-Labor party machinery in such states as it suits their purpose, as witnessed in the election of Magnus Johnson in Minnesota and the more recent conclave in New York State.

Organ of Group Powerful

ONE of the most powerful instruments in the hands of this coterie, for the carrying out of both economic and political plans, is the weekly journal, *Labor.* Originally that paper was started by the Plumb Plan League and it is said now to have a circulation of more than a million copies. In several political campaigns the paper has been most effective. During the Minnesota contest over the United States senatorship, a special edition of 450,000 was circulated in the interest of Mr. Johnson's candidacy. In 1922 it was also used effectively to help defeat Albert Beveridge for United States Senator, when his speeches indicated to the group that his ideas were inimical to their purposes. In other states it has been used to advance the cause of candidates whom the coterie had decided to back.

All of these instrumentalities of the coterie's political machine are controlled in a large measure through the purse. No one except themselves knows what it costs, but close observers can readily believe that the aggregate sum is not nearly so large as either of the major political parties spends in a national campaign. Their greatest strength lies in the fact that by concerted action they are able to turn the restless political flux throughout the country into a stream of votes for candidates who, they believe, will espouse their economic principles. And, behind it all, is the single purpose to bring about the control of the industrial plant of America by the workers themselves.

New England's Rock of Ages

Concluded from page 9

the ground about is still reddened by bits that are crumbling to dust.

On the crest of the hill is the most honored grave of all, that of William Bradford, governor of the colony for more than thirty years. A close neighbor is the Cushman monument, and beside it the original stone with the date 1691, of Robert Cushman, "that precious servant of God," and ruling elder of First Church for forty years.

Only a few steps away is the grave of Thomas Clark, aged ninety-eight, and, according to the inscription on his stone, mate of the *Mayflower.* There are the graves of the Cottons, of Thomas Faunce, identifier and preserver of Plymouth Rock, and that of Mary Allerton, the last survivor of the *Mayflower* band. There is the grave of Tabitha Plaskett, the first woman teacher in America, and the oldest Masonic stone in the country, dated 1743, and erected to "Mr. Nath Jackson." There is the Judson family lot, with a tablet to Adoniram, missionary to India and translator of the Bible into Burmese. Just outside the village is his house, the front door of which his sister shut when he departed and declared that it should not be opened until his return. Grass grew over the path and the doorstep was removed, for Adoniram was lost at sea.

One of the most visited graves is that of Francis LeBaron, the "Nameless Nobleman" of Jane Austin's story, who was cast up from a wreck of a French vessel. Not far away lie buried sixty sailors wrecked in the brig *General Arnold* in Plymouth Harbor in 1778. Their grave is marked by an obelisk "erected by Stephen Gale of Portland, a stranger to them, but as a just memorial of their sufferings and death." Near by is the grave of Hannah Howland, betrothed, it is said, to one of the seamen, and who, according to her stone, "died of a languishment," and then follows the epitaph,

"For us they languish & for us they die
And shall they languish, shall they die in vain!"

Quaint epitaphs abound on Burial Hill, touching in the very rudeness of their language and the sincerity of the effort to reflect the emotions of the bereaved. Among the most pathetic are those of the children. One reads,

"He glanced into the world, to see a sample of our misery."

Another with a brave attempt at fortitude,

"O happy Probationer! accepted without being exercised."

And this with a true poetic note beneath the jangling rhymes,

"He listened for a while to hear
Our mortal griefs, then tun'd his ear
To angel harps and songs and cried
To join their notes celestial, sighed and dy'd."

Poor little Pilgrim children! We do not read much about them but when we learn that there were no cattle in Plymouth for four years and then the supply of milk was of the scantest, we realize that they were little martyrs, too. And yet, no doubt, with the eternal joy of youth, they romped over this hillside or gazed out to sea, scanning with curious eyes the same beautiful panorama that stretches before us.

A little to the north lies Clark's Island, where the exploring party from the *Mayflower* spent the first Sunday in rest and prayer. There is Saquish, "abundance of clams," which saved the little band from downright starvation the first winter; there is Duxbury with its statue of Miles Standish guarding the bay, and, dim and beautiful in the distance, the white reaches of Cape Cod. At our feet flows Town Brook with its meersteads and terraced gardens rising above it.

And the general plan of the town and its streets is as the Pilgrims left it, and at every turn there are reminders of an earlier day. There is the site of the cottage of the "Nameless Nobleman" and his Mary; there is the John Winslow house where later Mercy Otis Warren wrote her history of the Revolution, and Tabitha Plaskett's house where she spun as she taught, and, so the story goes, if a youngster was unruly, slipped a skein of yarn under his arms and hung him on a peg. Two houses are still standing which have echoed Pilgrim voices, the Howland house, 1666, and the William Harlow house, built a year later and framed with the timbers from the fort on Burial Hill. And, over the town rises the National Monument, topped with the majestic figure of Faith, 216 times life size, the largest piece of granite statuary in the world.

And Pilgrim Hall is filled with memorials, more frail, yet still more precious. There are the shoe buckles of Elder Cushman, great, sober buckles, as those of a ruling elder ought to be. There are the iron pot and pewter plate which Myles Standish, practical soul, brought with him on the *Mayflower.* And there is his sword, too, of great antiquity, perhaps before the Christian Era.

And back of the Hall is a garden where one may rest beneath the trees and dream. For Plymouth is a village of dreams, bewildering, and, with all its poignant charm, indefinably exotic. Carver, Bradford Standish, Brewster—the place is *theirs,* and the stranger wonders vaguely if he has felt the spell of their presence, or if he himself has dimly glimpsed, beyond the actual Plymouth, an enduring one which is their dwelling.

"A Light to Them That Sit in Darkness"

Descendant of Famous Chief, as Priest, Does Much for People

By LOUISE F. TROXELL

"From the great lakes of the Northland
From the land of the Ojibway
I repeat tales as I heard them
From the lips of Nawadaha
The musician, the sweet singer."

IN THE latter part of the eighteenth century John Jacob Astor, a German immigrant, was laying the foundation for what was later to become the powerful Astor Fur Company. Some time after, this company took into its employ in the Northwest a young Indian who was the great grandfather, it developed, of one of the only two Indian priests this country has ever produced.

He must have absorbed some of the German thrift and industry he saw displayed, for his great-grandson has just completed what would seem the impossible task of erecting a $45,000 church in a town inhabited by 1,200 practically penniless Ojibway Indians. This town is Reserve, Wisconsin.

This young priest has dedicated his life to the service of the people of his tribe who are probably in greater need than any other Indians of our country today.

"My family," Father Gordon says, "has always had friendly relations with the white men. Like all other Indian families, each member of ours had a distinct name, such as Yellow Horse or Blue Hair. My great-grandfather, however, learned from association with the whites the advantage of a family name and on his death gave to his son, my grandfather, the name Gordon which we have borne ever since. The town of Gordon, Wisconsin, is named for our family."

Conversation with this ready-speaking, frank-faced Indian shows him of that unusual type that knows the Indian from an Indian's point of view but is also able to see him as he appears to the white man.

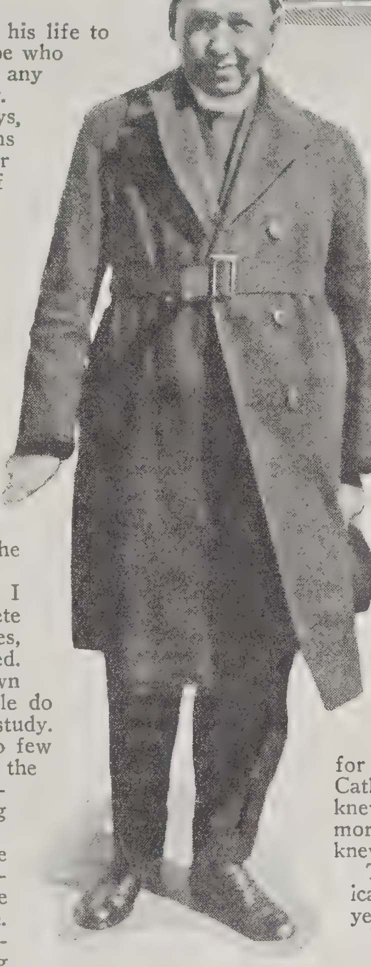
"It took me twelve years after I finished the eighth grade to complete my work for the ministry. O, yes, and I worked hard, too," he laughed. "I loved it and I did not break down in health as so many of our people do when they devote themselves to study. It is not for lack of interest that so few of our blood are in the work of the church. It is just that they cannot stand the strange and trying confinement.

"Tuberculosis is the greatest foe we have. We are used to the out-of-doors and the restraints of school life make us a ready prey to the disease. Many of my friends have started toward the priesthood but, excepting one other, I alone have been able to stand the rigors of the preparation."

Father Gordon was born at Reserve on the Courtes Oreilles reservation in 1886. The family later moved to the Bad River settlement and he began his education in the sisters' school at Odanah. These good women, seeing his promise, raised the necessary money and sent him for further work to St. Thomas's military school at St. Paul.

The rigorous program of sports at this school gave the young man the constitution necessary to withstand the dread tuberculosis which had already claimed three brothers and a sister. There also he got his foundation in the classics for soon after entering St. Thomas's he determined to become a priest.

Father Gordon's church.



REV. FR. PHILLIP GORDON.

A lineal descendant of the famous chieftain, Hole-in-the-Day.

Phillip Gordon, pere, was a government policeman and through his work thoroughly familiar with every spot on the reservation. When the time came for the son to claim his regular allotment of eighty acres the father selected the most beautifully timbered one of all that remained.

The government agent was helpful in cutting and marketing this timber to advantage and presently young Gordon found himself the possessor of ten thousand dollars acquired from the sale of the wood alone.

Though it was legally his money he was not allowed to spend it without the consent of the white agent on the reservation and it was with considerable trepidation that the young man broached to him his wish to go abroad and continue his studies for the priesthood. The agent, though not a Catholic, readily gave his consent, for he well knew the great need among the Indians for moral and spiritual help from someone who knew them.

The young man went straight to the American college in Rome where he stayed two years. From there he went to Innsbruck University in the Tyronne for four years' study, traveling extensively during vacation periods and perfecting himself in French and German. Returning to America he did graduate work at Catholic University, Washington, D. C., and later served in the Bureau of Indian Missions, visiting remote settlements as a missionary priest.

His great sympathy with the Indians, however, and his farsighted ambition for them led to his permanent assignment in 1918 to the Courtes Oreilles, Lac du Flambeau, and St. Croix bands with headquarters at his old home, Reserve.

There is the direst need among these people, according to Father Gordon. The Dawes Act of 1886 forced each Indian to accept his 80-acre allotment. The law prevents their selling the land but they were allowed to cut and sell the timber. They did this, spent the money like the children they were, and were immediately impoverished.

"Then why," I inquired, "do they not support themselves by cultivating their land?"

"Well," replied the priest, "take the case of my mother, which is in no way unique. Her land, though 'cleared,' is covered with stumps. Indians know nothing of 'stumping' land and if they did they have no facilities for doing it. Add to this the fact that her land is eight miles from the nearest road which much of the year is quite impassable and the fact that even if these conditions did not exist there is no market if she raised a crop, and you will see that she and her kind are reduced to raising little 'patches' of crops and then eking out a living by any other means possible.

"The beautiful scenery around Reserve has made it popular with tourists. This is a godsend to my people, who make fair wages in summer acting as travelers' guides. Beyond this there is little they can do, though trapping and lumbering are carried on on a small scale.

"They are so poor that three years ago some actually died as the result of lack of nourishment, yet it is practically an unheard-of thing for an Indian to apply for county aid.

"I know the justice of the white man's claim that the Indian is thriftless—even lazy. But given his heritage and environment, would the white man be any better?"

It is largely due the paternalistic attitude of the white man that the Indian has become so abnormally dependent, Father Gordon asserts. The application of the Dawes Act has resulted in the breaking up of tribal relations and he believes that, once started, it must be continued until every Indian is a full-fledged American citizen, voting and paying taxes.

"If a white child grows up to the age of twenty-one, he automatically becomes a citizen of the United States and is allowed to vote. But an Indian may live a lifetime associated with educated whites, himself be an intelligent member of the community, and still not be allowed citizenship. Is there anything which could more successfully block the progress of my people?" This is the good priest's theme wherever he goes.

With the gentle patience to be seen among those who find themselves enlisted in a cause too great for accomplishment in their lifetime, Father Gordon perseveres in his work. Several times a year he leaves the reservation to go to the capital of his state and back to Washington interviewing people in authority, reporting conditions in his parish, and pleading for more interest in the Indians' problems.

The church just being completed under Father Gordon's leadership is a marvelous testimony to his ambition and industry. Stimulated by his enthusiasm, the Indians volunteered all the work. The head carpenter and two masons were Indians and the plans were drawn by an architect at the capital who is a friend of the priest.

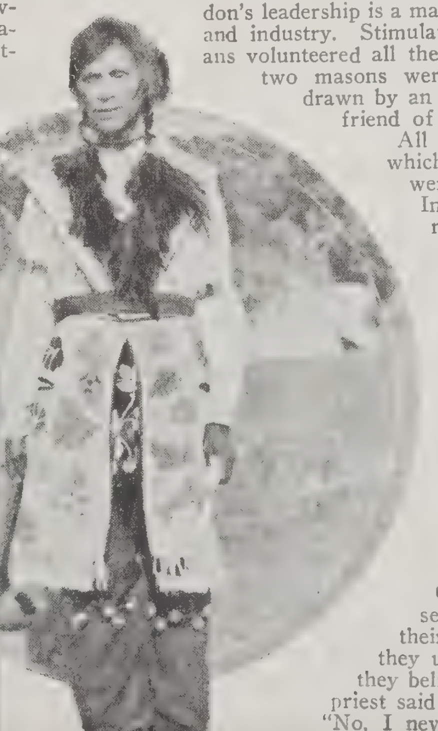
All the beautiful granite boulders which form the exterior of the church were picked up on the reservation. In addition to the church an eight-room parish house of granite and logs has just been finished. This has a lighting system and a bath with hot and cold water—unheard-of marvels among the Indians.

"Yes, my people are dirty, looked at through white men's eyes," said Father Gordon. "But they have no training or facilities for being otherwise. Thirty-five per cent of them are affected with tuberculosis and they know nothing of how to stop its ravages."

Seventy boys under Father Gordon's care volunteered for service in France and seven gave their lives for a cause which perhaps they understood only dimly but which they believed to be just because the good priest said it was.

"No, I never want to leave Reserve," said Father Gordon. "That is the work I love and understand and I ask as my only reward greater appreciation on the part of the white men of the Indians' problems. Oh, I might want to go to Chicago once in a while," he laughed, "to see Babe Ruth play baseball, but I hope to live and die among my people."

With all their poverty and sickness, however, life is not dull on the reservation. The Indians love to dance and would continue for weeks if not restrained. The priest's father is quite modern in his tendencies but his mother loves the old days and ways and on ceremonial occasions appears in full regalia.



An Ojibway full-blood chief.

Here is a band of Ojibway veterans of the Civil War. These Indians are good Americans.

BRIEFLY TOLD

A heavy wind lifted an eleven-year-old boy from the roof where he was flying a large kite in New York City. The lad kept his hold of the string and floated safely fifty feet to the street, the kite acting as a parachute.

Senator Smoot, of Utah, only shaves, or is shaved, every other day. He thinks that is often enough and he "likes to give his face a rest."

Every year $100,000 is received in letters at the Dead Letter Office of the Post Office Department in Washington. Nearly all of this mail containing money fails in delivery because of improper address.

Thorn Lake, in Eastern Oregon, has for years been thought the site of a prehistoric city. In its depths are walls, rising in geometric precision, which bisect the lake bed, and investigation has just been set afoot to learn whether their origin is from a natural cause or the work of man in years gone by.

A consignment of oak was sent to Europe. It was found to be wormy and there was no market for it until the consignor happened to visit an antique furniture factory. The manager of the factory was busily engaged in manufacturing "antique" grandfather clocks, boring the wormholes by hand. He was very glad to buy the wormy oak and paid a much better price for it than for sound oak. A profitable connection was established between the exporter and the antique manufacturer.

Sassafras, harvested and manufactured into paper in Lake County, Florida, was used in a recent issue of the Leesburg *Commercial*, a local newspaper, which predicts great future for the industry. In view of the growing scarcity of pulpwood this is interesting.

Much business in German cities is done with privately issued currency. Some is of paper and some of composition discs the size of metal coins. Not a legal tender, they yet circulate freely as money within areas where the issuing business firm is known.

Secretary Hughes says the Monroe Doctrine is "Uncle Sam's private, exclusive, personal affair—not, for instance, a 'regional understanding,' as the League Covenant described it, or something to be enforced jointly by the nations of Pan-America. The Government of the United States reserves to itself the definition, interpretation and application of the Monroe Doctrine."

A Canadian pulp mill has succeeded in manufacturing a very good grade of blotting paper from ordinary wood pulp. Blotting paper is usually made from rag pulp.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Wilhelm Hohenzollern has ordered an eight-foot fence built to keep the newspaper reporters from looking into his back yard at Doorn.

Double window panes, separated by a distance of two millimeters and joined together at the edges by a specially patented melting process to prevent moisture or dust getting between them, are used to keep out the cold in the place of ordinary double windows. It is said the heat insulation is perfect under these conditions.

A new Chinese phonetic alphabet has been adopted by the Chinese for the transmission of telegrams. Heretofore Chinese telegrams were coded into numerals and decoded by the receiving office.

Pirates are operating on the Black Sea, according to official reports sent to the Department of the Interior at Sofia, Bulgaria. A vessel loaded with attar of roses bound from Burgas to Constantinople was brought to a halt by shots fired from a steamship displaying no colors. A number of the pirates boarded the merchant vessel, killed the captain, his crew of five and another passenger and carried off the money the passenger was taking to Constantinople to buy goods. The vessel was then set adrift in a sinking condition.

Artificially colored flowers must not be sold in Rome. The pure food law was applied to flowers, and those who sell "faked" flowers will lose their licenses.

Sherman's march to the sea cost Georgia no more than the loss that state is suffering from the migration of her Negro population, according to the Georgia Bankers' Association. The state is threatened with a loss of wealth amounting to $27,000,000 this year. It has 46,674 vacant farm houses, 55,524 idle plows, and a labor shortage of 70,843 persons.

The chairman of the Joint Congressional Committee on Reorganization of the Executive branch of the Government pointed out that the first six Presidents to die averaged 79.6 years of age; the next ten 68.5 years; the last ten, 61.8 years. He recommends that the President have a staff of six assistants to lighten his work. They should consist of a secretary to the President, acting as private secretary; an executive secretary, who would have four assistants divided as follows: an assistant in charge of personnel, dealing with office-seekers, and so forth; an assistant in charge of legislation, to follow legislation in both Houses, keeping the President informed; an assistant in charge of publicity to report on public opinion, to present the President with pertinent clippings and gather material for speeches, and an assistant in charge of applications for clemency.

Copper applied in a solution of oil is now being used instead of tar for preserving rope. Marine pests eat the tar out of the rope and then devour the rope itself, but with the copper-impregnated rope there is no damage resulting from marine pests. The copper bulks less, weighs less and costs less to apply than the tar.

Austin Harrison in the London *Observer*, says, "Germany is, financially, completely Bolshefied. A new aristocracy has arisen—the Jews: they occupy all the big hotels in Europe. They are in possession. In Vienna, in Poland, in Germany, in Hungary, the young Jew speculator is the new *Fürstlichkeit*; he is smart, intelligent, and energetic, and he sits in the royal boxes at the operas."

Holding that it is the automobilist's duty to slow up when old persons or children are near his line of travel, a Detroit judge denied a motion to dismiss the complaint of negligent homicide against a careless driver whose car ran over and killed an elderly woman. The defendant's attorney moved to dismiss the complaint because no criminal intent was evident in his client's actions. Testimony showed that the woman stepped off the curb into the path of the defendant's car. The judge held it is the duty of the driver to stop when children or old persons are in the way.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

CHRONICLER OF THE NEGLECTED TRUTH

Is Muzzey's American History Revolutionary?

Author Holds Work a Review of What Happened and Analysis of Why It Did

By CARSON C. HATHAWAY

AN AMERICAN History used as a textbook in more than five thousand schools has attained considered popularity. Attempts to bar this text from the schools on the charge of being un-American have opened an interesting question.

The text is *AN AMERICAN HISTORY,* the author, David Saville Muzzey, a professor at Barnard College and the author of many historical works. His much discussed book is the result of a purpose to present historic facts by a new method.

"Its aim is not to tell once more the old story in the old way but to give the emphasis to those factors in our national development which appeal to us as most vital from the standpoint of today." So reads a statement in the editorial preface.

In certain quarters Muzzey's book has aroused bitter opposition. As a typical example may be mentioned the appeal of the Piney Branch Citizens' Association, of Washington, D. C., that the book be withdrawn from the high schools in that city. A history taught in the capital should be a good exponent of Americanism. Muzzey's text is the standard in the city and thousands of students use it annually.

Charges of Opposition Bitter

THE Citizens' Association, composed of several hundred members, has been prominent in civic discussions in Washington. It now charges that the book "by innuendo, distortion, modification and suppression of undoubted historical facts, falsifies American history, robs it of patriotic inspiration and obscures the great principles upon which our Republic is founded."

It argues that:

1. The treatment of the Revolution and of the War of 1812 is uninspiring and pro-British.
2. The history is politically partisan.
3. Socialistic doctrines are introduced.

The anti-Muzzeyites are particularly bitter concerning his discussion of the Revolutionary War. They point out that in a volume of 536 pages, he gives only fourteen pages to the battles of that conflict. Bunker Hill is limited to the sentence:

"In June, Gage's army stormed the American breastworks on Bunker Hill in three desperate and bloody assaults."

"Fourteen words to this immortal battle and later in the book fourteen lines to the story of Coxey's army and its march on Washington," cry the opponents of the text in indignation.

It is alleged that the book is pro-British. The cause of the Revolution is described as "a difference of opinion as to the nature of the British Empire." Hancock, Warren, Otis and the two Adamses are referred to as *patriots* but the word is put in quotation marks. In describing the battle of Lexington, the author intimates that the British fired apparently without orders. Only three sentences are given to the *description* of the battle of Saratoga, one of the so-called decisive battles of the world. Valley Forge is described in sixteen words, while the battle of Bennington is omitted entirely. No mention is made of Nathan Hale but Major André is introduced under the title of a British "agent" and the statement made that he was hanged "*as* a spy" and not that he *was* a spy.

Professor Muzzey's Answer

SIMILAR criticisms are made of the presentation of the War of 1812. It is charged that Muzzey excuses British methods leading up to the conflict, stating that "in her desperate struggle with France, Great Britain could not afford to have her seamen leave her ships by the hundreds to take advantage of the high wages, good food and humane treatment which they found aboard the American vessels. If the British lieutenant conducted his examination of an American crew in a summary fashion and impressed a good many real Americans among the suspected deserters to serve the guns of the British frigates he thought he was erring on the right side. After all, Englishmen and Americans were not so easy to tell apart."

Complaint is also made that Muzzey does not even mention such eminent naval leaders as David Porter, Stephen Decatur, Isaac Hull, commander of the famous *Constitution,* and William Bainbridge.

So much for the adverse criticisms. Now for Professor Muzzey's answer. His book was prepared for students in the third and fourth years of high school. It is assumed that such students will have had several years previous study of American History. They will have read over and over again the familiar stories of Nathan Hale and Molly Pitcher. Repetition would be superfluous.

In the front of Muzzey's text is the Latin phrase, *rerum cognoscere causas* which may be literally translated "to know the causes of things." In that phrase is the secret of the book. The real question is, "Are the students to be entertained by familiar hero stories or are they to be taught to think?"

To quote the author himself, "A detailed description of battles and campaigns is profitable only to experts in military science, whereas the causes that lead a country into war, especially into a war for independence, are most important stages in the evolution of a people's political and moral life."

It is quite true that Muzzey gives only fourteen pages to the description of Revolutionary battles. But he gives nineteen pages to an analysis and discussion of the Constitution, a subject on which the high school students for whom the book is written will have little intimate knowledge.

One extraordinary thing about the controversy is that while Muzzey is charged with being pro-British, he was born and raised in Lexington, Massachusetts, the descendant of men who actually took part in the historic battle in that town. Muzzey's early life was fairly saturated with the Colonial atmosphere.

But when he came to write the story of the Revolution he approached the subject with a judicial mind. He considered it only fair to state the British point of view as well as that of the colonists. There are usually two sides to a controversy. To suppress the truth would be as bad as to falsify the record. Furthermore, the story of the difficulties that the colonists had to overcome gives greater commendation to their ultimate triumph.

The second charge against the book is that it is partisan, presenting a Democratic viewpoint, particularly in its treatment of the events of the last half-century. Blaine is called "the somewhat discredited Speaker of the House, under the reproach of shady dealings with the railroads." Cleveland is said to have been nominated against him because of the demand for an honest candidate and is pictured as a man of directness and decision of character while "Harrison was willing to accept the dictates of party leaders."

As to Our Politics

THE book states that "Marcus Hanna, the very incarnation of that spirit of commercial enterprise which created the great trusts, secured McKinley's nomination"; that "as a statesman Grant was pitiable"; General Benjamin F. Butler was "an unspeakable demagogue" and Sumner a "visionary."

It is further charged that throughout the discussions of the tariff, the author displays a partisan spirit, constantly asserting in one form or another that the tariff is a means of taxing the poor and the laborer for the benefit of the rich man and the trusts.

To such charges, those who praise the text, and they are many, call attention to the fact that *the first element of history is truth.* If it is well known that certain leaders have been weak or vacillating, should they be idealized? In this connection, the recent statement of Dr. J. J. Tigert, Federal Commissioner of Education, is pertinent.

He says, "Although the schools in the United States do not teach that the king can do no wrong, many of the histories used in American schools imply that the United States can do no wrong and is never in the wrong. While preserving our patriotism in the schools, it should not be overlooked that we make mistakes."

Muzzey's admirers contend that it is unfair to single out one sentence or phrase here and there as a basis for condemnation. For example, while Muzzey does say that "as a statesman Grant was pitiable" he also says, "As a soldier he had been superb" and "a more honest President never sat in the White House."

Blaine *is* called "the somewhat discredited Speaker of the House," but he is *also* termed "one of the most brilliant men in the history of American politics."

The ancient Greeks and Romans had the habit of elevating their former rulers to places among the gods. America follows the example by creating traditional heroes instead of picturing both the good and the bad traits of her men of destiny. Such a course may be generous but it does not aid in an understanding of historic events. Forced to choose between flattery and the truth, Muzzey chooses the truth as he sees it.

The final charge against the text is that it contains radical and socialistic doctrines. It is alleged that he suggests that the courts may be and have been bought and that laws are passed to put money into the pockets of the lords of Wall Street at the expense of the poor laborer.

Concerning the radical movement preceding the campaign of 1896 Muzzey writes, "The Crusaders were ready—radical Democrats, Populists, National Silverites—it needed only a leader to unite them into a compact army against the money lords of Wall Street, who, they believed, had loaded their farms with mortgages and purchased legislatures and courts to thwart the people's will."

His critics contend that such statements tend to inflame the youthful mind against the government and fail to engender patriotism. "Muzzey is socialistic," they charge.

Professor Muzzey rejoins that one of his most bitter critics has been Charles Edward Russell, formerly candidate for governor of New York on the Socialist ticket. While Muzzey does criticize certain traits of men in the Republican party, it may be remembered that the Republican party has ruled in all save three administrations since the Civil War and that "the tall trees always attract the lightning." If the Democrats had been in power over an equal period, it is altogether likely that certain activities of their leaders would have been subject to just criticism.

His description of the Bryan campaign is merely the presentation of the viewpoint of millions of Americans of that day, a state of mind that was so well known that its historical accuracy cannot be doubted. There are usually two sides to any question of public policy and the views of the defeated as well as of the victors should be recorded.

Viewpoint Held "British"

NOR does Muzzey believe it constitutes lese majeste to question the infallibility of the courts. Lincoln himself questioned the Dred Scott decision. The courts are composed of human beings subject to errors of judgment, and to say that all judges are upright is to contradict the verdict of history.

Such are the conflicting views of the opponents and the defenders of Muzzey's history. Against him are ranged certain patriotic and civic organizations. Chief among these is the Sons of the American Revolution, the chairman of whose Committee on Patriotic Education has been waging an unsuccessful fight against the book for several years.

The Commissioner of Accounts of New York City recently recommended that eight history texts, Muzzey's among them, be barred from the public schools on the ground that they contain the British viewpoint in the discussions of the Revolution.

The defenders of the text are equally emphatic in their views. In Washington, D. C., for example, Muzzey's text is openly praised by practically every teacher who uses it in classroom work. The High School Teachers' Association recently adopted the following resolutions:

"It is resolved that the questioning of the Americanism of the teachers of history in American schools is resented, that the teachers should themselves be the judges of the content of the courses and that the object of teaching history is to give the truthful picture of the past, with due regard to the age of the pupil for whom the work is intended, and therefore the truth should not be distorted for any purpose whatever; both sides of a controversial question should be presented from an academic point of view so that the students of history shall be trained in habits of open-minded tolerance."

Seeks Unbiased Treatment

THE head of the history department of the high schools of Washington adds, "Statements to the effect that Muzzey's history is ruled from use in the New York schools are false. Books may be ruled from use by the school authorities, not by the Commissioner of Accounts. School authorities did investigate history texts in New York through an investigating committee of twenty-one. The subcommittee that investigated Muzzey's text found no fault with it whatever. I had a letter from each member of the subcommittee, in which the book was highly commended."

Muzzey's history was first published in 1911. It has gone through several editions and is now used in nearly every state in this country. More than five thousand schools have adopted it and it is used as a text in schools in Hawaii, Alaska, Porto Rico, Panama and China. In the last two years it has been adopted in fifteen hundred educational institutions. It is used in fifty of the one hundred largest cities in the United States and in thirty-one of these it is used exclusively.

To Muzzey, history is a review of *what* happened and an impartial analysis of *why* it happened. To those who desire to be thrilled by the familiar stories of our national heroes, the text may not be satisfying. But perhaps there is enough thrill in even an unbiased treatment of American history to satisfy any thoughtful and patriotic American.

In her working costume at Otowi.

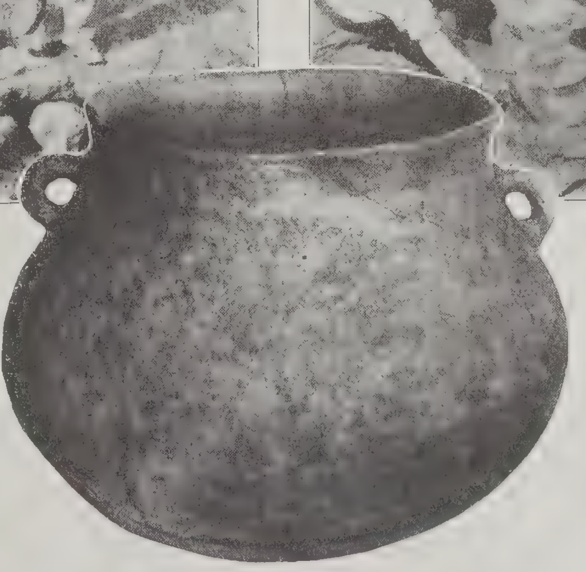
A WOMAN scientist, Mrs. Lucy L. W. Wilson, principal of the Southern High School for Girls in Philadelphia, has been responsible for explorations that have introduced to modern readers a "lost race" of early Americans. In all probability they lived much later than the highly civilized Mayas, and that fact alone makes them of extraordinary ethnological interest, since their art and customs were much more primitive. Scientific study of these people who once built apartment houses in New Mexico, therefore, enables scholars to get some idea of the beginnings of Maya and Aztec civilizations, since it is certain that they developed from just such beginnings.

The name given to the city of the dead that was old when Coronado and his band of Spanish adventurers traversed the great Southwest in the fifteenth century in their search for El Dorado is "Otowi," and it means "the Place where the Water Sinks." It lies about fifty miles northwest of Santa Fe, New Mexico, a dozen miles from the nearest railroad station, in the heart of the district that scientists have said is the richest in the country from an ethnological point of view. There Mrs. Wilson spent several summers directing surveys and the work of excavation, which was done by Indians.

Scientists of the Smithsonian Institution first located eight communal dwellings at Otowi, but did not explore them. When Mrs. Wilson became interested in the site after tours of various Central and South American ruins, she came to the conclusion that there was more to the settlement than had been revealed. Accordingly she made a more detailed survey which brought to light the ruins of dozens of single houses and a large pueblo on top of the mesa or table-land 1,300 feet above the site of the dwellings previously located; two community houses and dozens of small groups in cliff houses, eleven large pueblos on a low ridge of land to the south, and three more on another ridge. The community, as so far surveyed, includes sixteen apartment houses, some of which were five stories high.

The use made of this piece, which looks like a grindstone, is a mystery. It is very rare in the New Mexican ruins.

Showing how the Tewa Indians carefully remove the earth with trowels from around a piece of pottery to prevent it from breaking.



Handles are not common in the pottery of this region.

In the caves Mrs. Wilson found drawings similar to those found in prehistoric caves in France and other countries, indicating that the race that lived in New Mexico was probably the latest survival of a type of primitive man extinct in every other country. "Within half a mile of each other," says Mrs. Wilson, "in the narrow canyon of Otowi, there are indications of at least twenty-six farmhouses belonging to the period before the concentration, and of six large houses of the later period. Moreover, there are many groups of at least two-story porch houses in the almost perpendicular walls that bound the canyon on the north. These cliff dwellings were occupied contemporaneously with the large houses, and may, indeed, have been the winter homes. Still it is difficult to believe that the population of this little valley could have been much less than a thousand in the period just before the great concentration, or less than two thousand in the palmiest days afterward. Probably the depopulation was due to a gradual migration to the better watered and more fertile lands of the Rio Grande. Nevertheless, a protective stone wall and the location of a reservoir so that it could not fail to receive drainage from the large burial mound do suggest that there might have been cataclysms due to enemy attacks and to pestilence that hastened the desertion of Otowi."

While Mrs. Wilson was directing the excavations, her camp was pitched on a small plateau. Her tent contained only a cot, a portable washstand, a small table and a chair. A hold-all and suit hangers were suspended from the ceiling poles. "On my door pole," she says, "were suspended a pin cushion, a tiny mirror, my canteen and an electric lantern. In addition, we had a dining-room tent made of a tent fly."

Although there was not a white man within many miles, Mrs. Wilson was apparently not in the least afraid of the Indians, of whom she employed as many as fifty at a time in clearing out the rooms of the early dwellings. The archeologist becomes accustomed to "roughing it," since it is always difficult to get water. In this particular case there was almost no game, either, although when the village was occupied hundreds of years ago evidence indicates that there was plenty of it. The heat was intense, often rising to 124 degrees in the sun, but it was rarely more than eighty degrees in the little shade that could be found.

"The daily routine of work at the camp varies," says Mrs. Wilson. "It is comparatively simple when all are working on the same pueblo. Two Indians are assigned to a large room, one Indian alone if the room is small. I try to put an experienced Indian with one who has had less experience. They are both told where to put the debris. We do not use a sieve, but each Indian throws the dirt so that it thins out. They are very sharp-eyed and I think that practically nothing is lost, even such tiny objects as turquoise or other beads. All finds are placed on the edge of the place where they are working. It is my business to keep track of the happenings and to make records of the depths at which different things are found, when this is significant.

"The Indians always dig to the adobe floor, sounding it to see if there are any hollow or soft places to make sure that bed rock is underneath. Our most valuable finds are often underneath the floor, particularly in the case of not infrequent room burials. When the room is finally excavated, its measurements and peculiarities recorded, then it may be used to receive the dirt from another room. In this way, the walls are fairly well preserved and much expense is avoided. At the close of the day everything is cataloged and packed if possible. Of course, much of the pottery must first dry in the sun, as it has become moist from the earth and would break if handled too soon.

"Scarcely a day passed in our three summers of work that we did not uncover something of interest. Still, certain events stand out in red letters. The first of these was the uncovering of the body of a man, buried not in a room but in a passageway between the outside wall of North House and a heavy stone wall without. There were the remains of a cloth covering, a large basket, three long notched rain sticks, half a dozen prayer sticks, some of them ceremonially wound with cotton. Corn rested on the head, cheeks and chest.

"In the next room were a dozen ceremonial pipes, or cloud blowers, and a tiny pendant of copper. Both the room and the passageway were very near an interior kiva. From that fact and from the concentration here of so many ceremonial objects, we thought it probable that we had uncovered a carique, or priest. Since at the time of our discovery basket burials, common enough in Chaco and elsewhere, had not been reported in this region, we dreamed a dream of a foreigner and a stranger, who had not only ruled in his own lifetime, but was also able, even after death, to insist upon the burial rites of his own people. Later, however, we found evidences of the basket in seven burials.

"Another interesting day was marked by the finding of eighteen bone flutes and whistles, together with a perfect and beautiful little prayer meal bowl, all in a single room. The bowl's rim was notched in the making in four places, each, evidently, a guide to the four directions. The decoration was of conventionalized dragon flies, very similar to those so frequently found in present-day Navajo art. Diagonally opposite to this room was another in which was found another prayer meal bowl, also notched, decorated with lightning water serpents issuing from clouds. In this house we found the skulls of four deer and the jaw bones of seven. Another day resulted in the discovery of a little god or devil, in its own niche in the wall. It is made of clay, originally painted pink, but now black with soot. In a near-by room were eight similar niches, but all were empty. Numbers of stone idols have been discovered, but to date this is the only one of clay.

"But the greatest day of all was the discovery on the wall of the largest room excavated of a fresco, in color, of a mountain lion. The figure is colored yellow ocher, outlined with black. Evidences of color in the plaster of the caves, both at Otowi and at Frijoles are common. As far as I can find out, this is the only certainly prehistoric colored drawing ever found in the United States. The room measured twelve by eighteen feet. To the east was a fine ceremonial fireplace near a doorway much too small to have been used by living Indians, however well it may have served the spirits of their ancestors."

Otowi is now part of the Jemez National Forest and therefore is under government protection. Game wardens and forest rangers see to it that the occasional tourists do not disturb the ancient ruins. Only recognized scientists whose finds are intended for the benefit of the public in some museum are permitted to excavate, and they must first obtain a Federal permit. Owing to the difficulty of reaching the place, Otowi is seldom visited by tourists. Occasional parties have ventured over the trail, however, exploring the more accessible of the cliff dwellings. The extent of these, and of the stone buildings put up by the prehistoric inhabitants, is indicated by the following outline given by Mrs. Wilson:

"There are three large community houses on the Mesa of Great Otowi. South House is the oldest of these, to judge from its poorer masonry, comparative absence of communicating doors, lower walls, and the harder earth filling contained in its seventy-six rooms. East House is smaller, consisting of only forty-five ground-floor rooms, while North House, a great E-shaped pueblo, contains two hundred and seventy ground-floor rooms. The comparative absence of doors, the relatively large amount of adobe in the weak walls, and the comparatively small amount of stone on or near the surface of East and South houses incline me to believe that these houses were only a single story high. North House had a terraced second story, and possibly, not probably, a few third-story rooms.

"On a low ridge, a few hundred feet south of Great Otowi, there are two groups of community houses apparently contemporaneous with South and East houses on the larger mesa. One of these groups consists of two buildings, a rectangular house of forty rooms, all excavated, and the other a hollow square of perhaps a hundred rooms.

How Common Is Heroism?

ONE never dreamed it possible, but the world has simply become "fed up" on heroism. Like brains, it has become a drug on the market. We were warned by the wise at the outbreak of the war that courage is our commonest human quality. The war made so many heroes that many of them tried to hide to escape going into a group too large to be very distinctive. There came a time among the "boys" when to be called a "hero" meant a fight to defend one's good name. Heroism was common—the most glorious, unforeseeable, self-sacrificing heroism was free as water among men.

People said, "If we could only have such heroism in times of peace, in common life." Apparently we have. A Detroit paper is offering a house to the person convicted by selected judges of having committed the greatest act of heroism in common life. The lists began to fill up at once with the most touching, and amazing, and thrilling narratives, all attested. And these were acts performed, not under the stimulus of martial excitement, but in the workaday world when the consequences were likely to be dire to the doers.

Yes, courage seems to be our commonest quality.

Responsibility for "German Money"

WHEN other arguments fail to move him the student of the Money Question is confronted with the horrible example of undue inflation in Germany, Austria and Russia. It is true, the soft pedal has been applied in the case of Austria. The flotation of a huge loan, under the terms of which that country has agreed to pay a dollar for every eighty cents received from the usurers who underwrote the loan, has made the Austrian situation quite satisfactory. The loan approximates one hundred millions of our money, for which the investors pay ninety millions, Austria nets eighty millions, leaving a cool ten millions for international financiers.

President Puelicher, of the American Bankers' Association, recently urged before the American Banking Institute, composed of younger employes of the banks, the necessity of educating the people to the true theories of sound money, a defense of the gold basis and of the Federal Reserve System. This he claimed was more readily to be accomplished because of the demonstration of the fallacy of the attempts of Germany, Austria, and Russia to finance themselves by paper issues beyond their power to redeem in gold.

Even so reliable a journal as *Bradstreet's* premises a discussion of the same subject on the theory that the depreciated issues are government currency. It says:

"Historians of the future will note as among the most remarkable phenomena of the present time the continued production of paper money by Germany."

The inaccuracy of this premise lies in the fact that the German Reichsbank, the imperial bank of Germany, is the sole power of issue in that country, and that, from the beginning of the depreciation of the mark, *the government liability to redeem the new issues has been withdrawn.* The paper mark is not a government money; it is purely a bank money, and is issued with no guaranty, even by the Reichsbank, of a redemption at a higher value than obtained on the date of issue.

The Federal Reserve System is the nearest approach to the European system that could be forced through Congress at the time of its adoption. By its administration, according to Paul Warburg, it has been brought much nearer that system, and its power is equal to that of the Bank of England, the Bank of France, or the imperial banks of Germany, Austria or Russia.

The Federal Reserve Bank of the United States has the right to expand the paper currency of the nation indefinitely, but the value of its notes will remain at a par with gold only so long as the government pledge remains. Supposing the insupposable, that the government of the United States should withdraw that pledge and at the same time permit the Federal Reserve System to replace currency withdrawn from circulation by speculators in compliance with bank and business demand for a medium of exchange, you would then have here the conditions of the origin of German inflation. The dollar would undoubtedly follow in the course taken by the mark.

But there is a side of the story never told by the financiers. The paper mark kept industry in motion. Bear that in mind. Under its "baneful" influence it has wrought injustice to the middle class in Germany, those who had fixed incomes, by lowering the purchasing power of the money unit. The deflation accomplished by the Federal Reserve System wrought similar injustice to a much larger class by absolutely blocking the progress of industry.

It is to be hoped that the young bankers of the institute will adopt Mr. Puelicher's advice and prepare for the work of teaching the principles of sound finance.

Bacon Or Shakespeare?

THE case is again in court—this time a new Baconian cipher is the evidence. Whether it proves that Francis Bacon wrote the Shakespearian plays does not much matter to any but the delving scholar. To the average person it is sufficient that we have the plays and that with popular priced books and drama they are within the reach of all.

Without doubt there is a distinct revival of interest in the works of Shakespeare, as we are accustomed to refer to these, the finest plays in the English language and among the finest of any language. Expensive and reasonably priced copies of these works find a fairly constant sale, and productions of these plays are enjoying a marked and increasing popularity. No person who lays any claim to education or culture can be ignorant of Shakespearian works, for they rank with the Bible as a *sine qua non* of education, as an unchanging fundamental of that growing heritage which is transmitted from one generation to the next.

So, because these plays are common possessions of us all, the controversy at one time or other arrests our attention. We hear the Baconians contend that William Shakespeare could not have written the plays because they show a greater knowledge of ancient and contemporary literature than he, a poor itinerant actor and playwright, could have possessed.

Following the same line of argument, Shakespeare (or Bacon) is criticized because the plays in most cases have not original but borrowed plots. Well, why not? It detracts not a whit from the intrinsic merit of the play that traces of the plot may be found in divers sources. Plot is perhaps the least important factor in the greatness of the plays. Moreover, practically all that is important in literature is the product of preceding ages. Whether Bacon or Shakespeare did the assembling of plots and situations—or whether it was done by Christopher Marlowe, as Mark Twain humorously maintains—the job was well done, the masterpieces remain, and ours is the joy.

The Vatican and Dress

TWICE of late the newspapers have carried word that the Vatican has asserted its dignity with reference to modern fashions. The first report indicated that the Pope refused longer to receive in audience women whose arms were unclothed or whose dress otherwise disregarded the character of the ceremony of reception. The second report was to the effect that an order had been issued to exclude women whose presence was heavy with perfume. Both reports were commented upon as showing how old-fashioned the Pope is. Quite the other view will be taken by those who have had any experience of public receptions, religious or otherwise. The requirements made are only those that have been recognized in wholesome society for a long time.

"Branch Banking"

IN THE matter of branch banking, which has been discussed before and of which the public is likely to hear more, there are two ideas involved. One idea is that of service to the public; the other idea is that of service to the speculative interests which the great eastern banking houses principally serve.

To take the second first: if it is planned to send a banking pipeline into the country for the purpose of sucking all available money to the East, the principle is wrong and should be resisted. There is too much money flowing East as it is, and the service of the East to the rest of the country is not within a million miles of justifying it. Most of the life insurance money flows to the East. And, even without a branch banking system, most of the surplus deposits of the smaller banks flow to the East. The result is a concentration in the East for speculative purposes, and a drainage of other parts of the country for development purposes. Even the tyro will see that there is something wrong with a system which makes it possible to borrow millions on motion pictures in New York when it is impossible to borrow hundreds on agriculture at Omaha—especially when the millions loaned on movies at New York were first collected from other parts of the country. A system of branch banking which consists merely of a national system of intakes for eastern money brokers is not a good thing for the country.

The first purpose of the bank is to serve the community in which it lives. This community may be small or large. In a great city, branch banks are a courteous extension of service. They go to the people with their facilities. They make banking easy. They appear in the industrial districts and encourage workers to deposit their pay checks. They establish clearance offices for those outlying centers of the city's business which sometimes spring up long distances from downtown. In this sense of service, branch banking is not objectionable; it is in the same class as branch telephone stations or branch groceries.

This explanation is necessary because it is sometimes found that people imagine that the local branch banks are being condemned. It is the New York branch banks all over the country that are being condemned. And even they would not be condemned, perhaps, if more of the spirit of service were shown by them.

One Million Slaves in the World

APPEALS to the League of Nations, or what passes therefor, to take up the question of slavery with a view to abolishing it, reveal the fact that the world still holds one million chattel slaves. In spite of the utter outlawing of the idea of slavery and of the wars fought to destroy it, the institution persists in that land which has furnished both the idea of slavery and the slaves, namely, Africa. The slaves in whose behalf the plea is now made are Africans. The centers of the remaining slave trade of the world are Southwest Africa, Tanganyika and Abyssinia. It is only justice to say for the latter country that slavery is outlawed there but is pursued much as bootlegging in the United States. The world is no better than it ever was, except in parts. The traveler today may wend his way not only over thousands of miles but back through thousands of years to the conditions which we are prone to describe as "ancient" but which really are contemporary modern customs, the only difference being that in our part of the world they are not the dominant customs.

Analysis Called For

HOW retail stores charge from 200 to 1,500 per cent excess profits was fully set forth in the Government report which formed the basis of an article in this paper of September 8. Commenting on the same facts the editor of the excellent *International Interpreter* (New York) says:

"It would be interesting to study an exact analysis of how a department store decides what prices it must charge for specific items. In the case of the amber beads, how much of the $11.74 profit, out of the $12.50 price, is required to pay for the advertising of the trinket? How much of all this must go for the sales girl's wages? How much does the delivery of this small purchase actually cost? For the dinner set, how much had to be assessed for storage space, until the set was sold? It is all a tremendous pyramid at any rate, that the department store balances upside down on the small point of the original valuation."

Mr. Ford's Page

THE question is asked, "When does the New Era begin?" It is similar to the question, Where does the sky begin? The sky begins at one's feet. The New Era has begun. It is here. This, however, is not such an answer as will satisfy the questioner. The one who asks is keenly desirous that something shall occur at once, something spectacular, and radically shaking the world.

One of the strangest things about us is that we do not see the occurrences nearest to us. Every age of the world has come in with very few seeing it. It has glided in. When men begin to identify their times, it is almost time for the scene to change—we have been just that slow of mind. Never has the earth and mankind been so shaken as during the past ten years, and there are still people who are living—in their minds—before the shaking occurred. We are historians, busily marking off the past into its little squares and eras; or we are prophets eagerly marking off the future into utopias and millenniums and heavens; but we are seldom Timers, checking off the exact values of the old era as they flow past us on every outgoing moment, and the values of the New Era as they swim toward us upon every incoming one.

The New Era is here, has been here for some time. Evidence of its presence is felt in the pressure to protect old, unjust and outworn things, and in the more powerful pressure of the desire for new efficiencies in economic and social life. Pressure is a sign of the presence of power. There is certainly pressure to be felt everywhere today.

But—there is always that "but," only in this instance it has to do with human vision, not with the New Era. There is no "but" about the New Era, only about our interpretation of its phases of coming. The "but" then is here; the newer life will flow first into the newer mold, and until the molds are made the life will not appear. Though that is only half the truth, the other half being this: when once the life is invited by a newer mold it comes increasingly and begins to make molds for itself.

To illustrate: you don't see anyone electrifying old tumble-down houses. If you will observe, the man who puts into his building all the very latest electrical devices for comfort and convenience, from kitchen to parlor, has been pretty careful first to build a good house. People don't put five thousand dollars' worth of improvement into a three thousand dollar shell. The receptacle which we offer to the principles of the New Era is not permanent enough to receive them. Would anything be more contrary to the efficiency which marks the works of nature than to pour into our present systems the life that shall immortalize them for another age? Why, it is only yesterday, so to speak, since the great steel industry, one of the biggest and best of our basic industries, decided that possibly they could operate efficiently and profitably on less than a twelve-hour day! Should the New Era have poured its immortalizing life into that twelve-hour day mold? Certainly not. That had to be changed. But it did change, in spite of everything, and it is to be credited to the pressure of the New Era.

Here and there and everywhere the new life is pressing in and one of the consequences is that other things are going out. This latter looks quite innocent in print, but it is not as easy as it reads. What a great many people want is to have the old ways with the New Era, and that is exactly what they cannot have. What a great many more people want is that the New Era shall reduce the necessity for working, and that is exactly what it will not do. We always speak of changes of the times as desirable, because we think they will deliver us from the undesirable conditions in which we are—but these undesirable conditions are the very seasons of change that we are asking for. Change never was without its pain.

> *THE New Era will not be a rosy vision. Its changes will bring sadness to many and suffering to some. All changes do. People are longing for the change, and it is here, and they don't like it. The New Era will be a good time to live, but not a lazy time. People will work more; that is, they will get more work done. What we call work now is only wear and friction and useless motion. Work will be a career; with most people now it is a compulsion; they work to be able to stop work sometime. Self-interest will be the same. Human nature always works for what it thinks is its interest. It has thought its interest is to fight work. When work is made every way its interest, then in self-interest, it will work.*

We are witnessing in this country the passing of a great race, the old race of Farmers. The change that is coming upon farming in this country is not pleasant to contemplate if one regards the present and individual details of the process. What happened to the cotton spinners when steam supplanted handwork, is occurring now to the farmers—a great and profoundly significant movement passing under our eyes, and we for the most part blind to its meaning. It means that farming is changing. Now, if there is anything that most people (who never farmed) would have asked the New Era to spare, it is the romance of old-time farming, but it is going.

And people are going to work more than they do. This also is contrary to some conceptions of the New Era which make it appear like a continuous picnic. Many persons shudder at the statement that people are going to work more than they do, it sounds as if men and women were to be reduced to driven drudges, a sort of dumb peasantry, and that all the privileges won until now were to be swept away in one great deluge of darkness.

Such a feeling shows how little we know of work. To do more work does not mean what some people think it means. To get more work done is not at all what the shiftless person imagines. The hard working man who gets up before daylight and drags himself around until night may be doing very little work, getting little work done, yet he may be killing himself with the motions of it.

When work is but the expenditure of muscle and "putting in time" it is at its lowest ebb of productiveness and also at its highest point of human fatigue and wear. Neither exertion nor hours are the proper gauges of work. Both, of course, enter into all work. The higher and more creative the work, the more they enter. But the daily work by which men live has been given the benefit of creative minds, managing minds, to such an extent that it has now been made possible in all enlightened industries for men to accomplish more in half the time, with half the expenditure of physical energies, and with the consequence of greater reward and satisfaction to themselves.

It is in this sense that it is said that in the New Era more work will be done. And what is more, Work will become more and more the career of people. It is not a career now, it is a compulsion. Millions are working to the end that they may be able to quit working as soon as possible. Millions are running around like squirrels on all kinds of "white collar" schemes in a feverish desire to avoid that dreaded thing which they call work. It is the push of necessity and not the pull of interest, that controls.

Well, though it may seem strange to say so, that will change. And lest someone should say it is impossible because it would involve too great a change in human nature, let it be said at once that it will involve no change in human nature. People always work where their interest is concerned. In industry, up to date, their interest has not been concerned. But it is rapidly becoming so. The way is opening up on all sides. False starts are being eliminated. False motives are becoming more and more impossible to conceal. The ground is forming for human interest to show itself by pulling in the collar instead of leaning on the breeching. For human interest always has been active—active against work, because then it thought it served itself. Presently it will be as active for work, because then it will see it serves itself.

The New Era has begun, is here in its advance lines, but that it will exempt any of us from responsibility to labor and to suffer change, is a delusion.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

South America—Land of Aristocrat and Peon

Descendants of Conquistadors Have Done Little to Develop Their Homeland

By CARROLL K. MICHENER

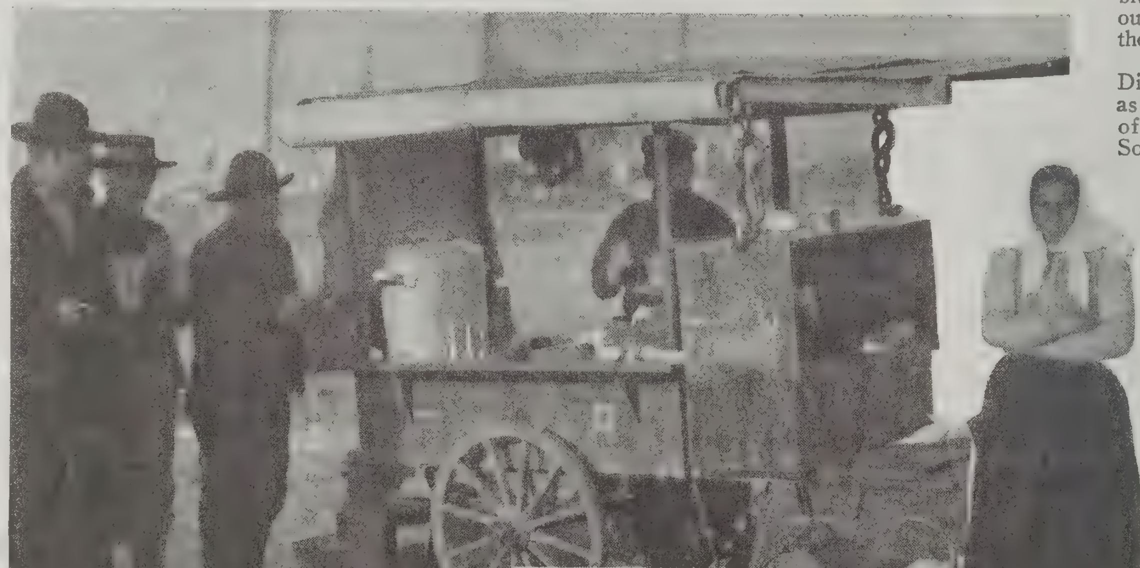
EIGHTY years ago Charles Dickens said some very uncomplimentary things about the United States of America. He made many kind, and many charitable and even flattering remarks, as well, but the impression left upon the North American public was one of fault-finding and lack of appreciation.

Something of the same indictment, for a very similar reason, must be brought against any present-day writer on South America—unless his disposition should happen to be akin to that of the late kindly and sympathetic James Bryce. Much can be said in compliment, and there is plenty of opportunity for the charitably inclined, but a large remainder of whatever may be put into words, with candor, is likely to fall over into the opposite category.

This, of course, would be as true of nearly any other part of the world. No one people, in spite of the Independence Day orators of a certain widely advertised area in the Western Hemisphere, has a monopoly on virtue. The casual observer applies his own standards to a stranger. He is not interested so much in similarities as in differences. And whatever is different he is more than apt to consider inferior.

The evolution of a common word in the English language illustrates this very human tendency of mind. A synonym for "foreigner" is "outlander," and from this root springs the adjective, "outlandish," which signifies, in the judgment of Mr. Webster, not simply a foreigner, but a person or object "barbarous, uncouth, unfamiliar of aspect or action." To seize upon the "outlandish" aspects of a foreign country, therefore, is likely to be derogatory, in spite of amiable intentions and a liberal admixture of flattery; at least it is prone to seem so to those who are under criticism.

Dickens came to the United States in the period of its most intense growing pains. It was exceedingly sensitive then to all criticism—a tenderness not even yet wholly calloused over. South America today is in something of the same temper. It is as irritable under adverse criticism as Japan—as, indeed, all countries in their years of most rapid development, the time of transition from short trousers to long.



Dock laborers at lunch along the water front at Buenos Aires.

One thing, of course, saves the Spanish-American from some of the sting, and this possibly accounts for a general absence of retort to the volume of critical comment that has been coming from the presses of Europe and North America during the past generation. This is his Spanish background. He rarely lays claim to it, for there is still some rancor inheriting from independence days. But like his ancestor, the self-sufficient Iberian, he has only to remember, when he is afflicted by an affront or by some evidence of inappreciation, that he is a Spaniard or that he is of Spanish descent. And he is heir to the conviction that there could be no boast prouder than that.

A likeness more striking than all others draws still closer the parallel between Dickens' "American Notes," collected eighty years ago, and the South American notes of most any observant traveler today. The degree of South America's material and social development, many of the conditions of living, and the manners and customs of its population, are similar to those that attracted the attention of Dickens in the United States of 1842.

If his conceit will permit, the *norteamericano* will discover many of his own faults, past or present, mirrored in the South American. He is not, of course, so likely to claim them, although he is rather fond of considering himself South America's mental and moral instructor. The idea of such a tutelage, however, meets resistance in the southern continent. The wise and blustery "big brother" notion involved in that much misinterpreted and most pretentious institution known as the Monroe Doctrine flourishes better in the Northern than in the Southern Hemisphere.

At any rate, to choose but a single example, candor will compel the expectorating citizen of the United States to find himself much at home in any South American country. The consumption of chewing tobacco is practically nil, this elegant custom never having appealed to the Latin temperament, but the necessity for spitting appears to be fully as urgent as in the United States, to judge by the prevalence of accommodations for it. The cuspidor vanished long ago, it may fervently be assumed, from the North American parlor; but we know of one such room in Bolivia, and have heard of others elsewhere, equipped with three or four of these receptacles, each within an easy range of some convenient aiming point.

Except perhaps for the delectable cuspidor, expectoration is hardly a happy choice of subject for purposes of deleterious contrast between North America and South. There are still too many spittoons in the United States. Dickens found them in courtrooms, hospitals, business places and even the halls of Congress. Washington, for him, attained one of its chief distinctions as "headquarters of tobacco-tinted saliva." For him tobacco chewing and spitting was an "exaggeration of nastiness" that could not be outdone.

Unhappily, cut plug still goes to Congress. As for the absence of chewing tobacco in South America, this means little in effect, for expectoration is rampant. And aim is poor there, or else the spitters are more careless. A gentleman, finding himself in a room clustered with cuspidors, can by no means be depended upon to trouble himself with one of them if the floor at his feet seems more convenient. We have seen the same thing in Spain, and are forced to conclude that the trait is racial and hereditary. We have seen Spaniard and Spanish-American alike expectorating upon the floor of a first-class railway carriage, with a cuspidor reposing on the carpet at his ankle and a window invitingly open at his elbow.

North America, of course, need not feel too self-righteous in this matter. Anti-spitting campaigns are still within the memories of her younger men. Laws protecting streets and the floors of public conveyances have not yet grown old on the statute books, nor have they lost their point through general observance. Some of the South American countries have followed this virtuous example, and Buenos Aires, always up to and beyond the minute in statutory equipment, posts its adjurations against spitters alongside the signs that designate its streets.

In a generation that finds frequent occasion to boast of its per capita investment in motor cars and bathtubs, there will be astonishment and incredulity at this paragraph in Dickens' "American Notes": "In all modes of traveling, the American customs, with reference to the means of personal cleanliness and wholesome ablution, are extremely negligent and filthy." Apparently there was not even the shallow tin tub that lurks under the bed of the unplumbed inn and dwelling house in present-day rural England!

Dickens might have said the same of South America, had he been able to visit it today. There are bathtubs in the leading hotels, but outside the great metropolitan centers they do not always "function." We know of one hotel bathroom that had to be exhumed from an accumulation of assorted debris, including coal, before it could be brought into its intended activities; and even then it was not by means of its own pipes that it was filled, but by the intervention of pots and pails containing the contents of the kitchen teakettle. We nearly and definitely lost faith in all "hot water" taps, and in most others as well, particularly the melancholy and disillusioned faucets that had long since drifted into innocuous desuetude on passenger trains.

We are wholly without statistics on this subject, but it has occurred to us that South American imports must be remarkably deficient in the item of plumbing supplies. This observation is based not alone upon experience, but upon hearsay from foreign residents gossiping about South American personal habits. One supporting bit of testimony is the amount of cologne and other aromatic substance that goes into consumption. Toilet waters cheat the bathtub of much of its rightful patronage.

A modern heir of the Incas beside a wall showing the skill of the ancient Peruvians.

There may be, of course, a logical explanation of this, so far as the semi-arid West Coast region is concerned. Water, there, is not so plentiful as to be used recklessly. Perhaps, also, there is to be seen in this languishment of the bathtub some echo of aboriginal influence upon the social life of the modern race-complex. Outside the Inca nobles, there is no record of a South American Indian ever having voluntarily taken a bath.

Of sanitation in general a great deal of comment might be uttered. Dickens hinted as much concerning the United States, but with some delicacy evaded the details. Perhaps it is enough to record that La Pas, during our visit, was celebrating the determination to install its first system of sewers, after an undrained existence of some four hundred years.

Dickens had less restraint with regard to Congress:

"Did I recognize in this assembly, a body of men, who, applying themselves in a new world to correct some of the falsehoods and vices of the old, purified the avenues to Public Life, paved the dirty ways to Place and Power, debated and made laws for the Common Good, and had no party but their Country?

"I saw in them, the wheels that move the meanest perversion of Political Machinery that the worst tools ever wrought. Despicable trickery at elections; underhanded tamperings with public officers; cowardly attacks upon opponents, with scurrilous newspapers for shields, and hired pens for daggers; shameful trucklings to mercenary knaves, whose claim to be considered is that every day and week they sow new crops of ruin with their venal types, which are the dragon's teeth of yore, in everything but sharpness; aidings and abettings of every bad inclination in the popular mind, and artful suppressions of all its good influences: such things as these, and in a word, Dishonest Faction, in its most depraved and most unblushing form, stared out from every corner of the crowded hall."

There are present-day Dickenses who have said as much concerning some of the parliaments of South America.

If there is a North American traveler who would unburden himself of a bit of sound disapproval of South American journalism, the political violence of which has often been remarked upon, it may be somewhat sedative and restraining to consider the corresponding infancy of journalism in the United States. Dickens found the newspaper here "not vapid waterish sentiment but good strong stuff; dealing in round abuse and blackguard names; pulling off the roofs of private houses, as the Halting Devil did in Spain; pimping and pandering for all degrees of vicious taste, and gorging with coined lies the most voracious maw; imputing to every man in public life the coarsest and the vilest motives; scaring away from the stabbed and prostrate body-politic, every Samaritan of clear conscience and good deeds; and setting on, with yell and whistle and the clapping of foul hands, the vilest vermin and worst birds of prey."

The creator of Mr. Pecksniff would find some amelioration of this horrible situation today, no doubt, and would discover to his dismay that, whereas the yellow journal has abated in the United States it has crossed over to Mother England and established itself there flourishingly.

In any case, no such impassioned indictment as that of Mr. Dickens in 1842 could honestly be laid at the door of South American journalism. Outside of the capitals it is, at worst, provincial and narrow, peculiarly concentrated upon matters political. And it possesses a number of outstanding virtues, principal among them a dignity that is rarely found in the "Colossus of the North." In *La Nacion* and *La Prensa,* Buenos Aires has daily publications that rank among the best of those printed in any language, and neither has the bad taste of a certain bumptious contemporary in Chicago that advertises itself to be "the world's greatest newspaper."

Except in the higher strata of civilization, table manners, like morals, are more or less geographical. South Sea royalty still takes poi with its index finger, but, as a rule, the knife and fork elsewhere in the world follow their proper usage among those "one would care to know." No doubt "sword swallowers" may be found in any country. In fact, it is not so long since that a candidate for governor in the United States of North America both lost and gained votes on the score of eating his pie with a knife. In general, it may be assumed, however, that this table implement, in the United States, has been tamed to its orthodox function. To get the thrill he enjoyed in this country during the forties of the past century, Dickens would be obliged to journey, now, into South America. There he would find, at least in the average social altitude, a merry play of the table knife between mouth and plate, and toothpicks ubiquitous and rampant.

But there was a concomitant of this matter of cutlery among Dickens' fellow travelers that happily is not to be experienced along the tourist highways of South America. "Such deadly leaden people," complains the novelist's notebook. "Such systematic, plodding, weary, insupportable heaviness; such a mass of animated indigestion in respect of all that was congenial, jovial, frank, social, or hearty, never, sure, was brought together elsewhere since the world began." To Dickens there was something funereal in the thought of "sitting down with so many fellow-animals to ward off thirst and hunger as a business; to empty, each creature, his Yahoo's trough as quickly as he can, and then slink sullenly away; to have these social sacraments stripped of everything but the mere greedy satisfaction of the natural cravings."

The Latin, whatever his minor social errors, has no such egregious fault as this. He is convivial at table, and he dines leisurely and well. More than all else, he has a liberal degree of what is traditionally known as a fine Castilian courtesy. If Dickens found an amiable civility to offset North American table manners, he might have been charmed in South America into observing no *gaucheries* at all.

It will take a long time for the United States to live down its ancient reputation for "Yankee shrewdness." If the term ever implied, in this country, any element of innocence and virtue, it gained no such acceptance abroad. Fortunately it has long since been repudiated at home. North American business has had much heart-searching in the course of the past two or three decades, and there has been a notable emendation of commercial practices, particularly with respect to Latin America. In place of the old and somewhat questionable astuteness there has grown up, indeed, sanctimonious disapprobation of what is looked upon as a somewhat general affliction of "Yankee shrewdness" throughout South America.

No secrecy veils the dishonesty prevailing in a multitude of forms among Latin-Americans. It appears endemic. Possibly it is an inheritance of the Conquest, which was wrought through treachery and maintained through unlawful violence and peculation; the Indian, at least, appears never to have recovered his confidence in human kind. And it may be that today's dishonesties are some of the harvest of the Jesuits' missionary policy of justifying the means by the end.

It is doubtful, however, if things are so utterly bad as Dickens seemed to find them in the United States:

"The following dialogue I have held a hundred times: 'Is it not a very disgraceful circumstance that such a man as So and So should be acquiring a large property by the most infamous and odious means, and notwithstanding all the crimes of which he has been guilty, should be tolerated and abetted by your citizens? He is a public nuisance, is he not?'

"'Yes, sir.'

"'A convicted liar?'

"'Yes, sir.'

"'He has been kicked, and cuffed, and caned?'

"'Yes, sir.'

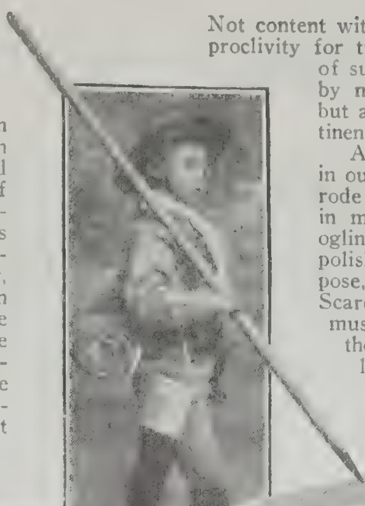
"'In the name of wonder, then, what is his merit?'

"'Well, sir, he is a smart man.'"

When we felt ourselves becoming perhaps a bit too critical of the vultures perched funereally upon the housetops of Callao, the vagabond canines infesting all Peruvian communities, the domestic animals of all sorts astray in the streets of Andean villages, and the cows milked by the dairyman at one's very door even in such ultra-metropolitan places as Buenos Aires, we had only to remember the amused scorn of Mr. Dickens at New York's vagrant populace of pigs, the city's self-appointed scavengers:

"Here is a solitary swine lounging homeward by himself. He has only one ear; having parted with the other to vagrant dogs in the course of his city rambles. But he gets on very well without it; and leads a roving, gentlemanly vagabond kind of life, somewhat answering to that of our clubmen at home. He leaves his lodgings every morning at a certain hour, throws himself upon the town, gets through his day in some manner quite satisfactory to himself, and regularly appears at the door of his own house again at night, like the mysterious master of Gil Blas. He is a free-and-easy, careless, indifferent kind of pig, having a very large acquaintance among other pigs of the same character, whom he rather knows by sight than conservation as he seldom troubles himself to stop and exchange civilities, but goes grunting down the kennel, turning up the news and the small-talk of the city in the shape of cabbage-stalks and offal, and bearing no tails but his own: which is a very short one, for his old enemies, the dogs, have been at that too, and have left him hardly enough to swear by. He is in every respect a republican pig, going wherever he pleases, and mingling with the best society, on an equal, if not superior footing, for every one makes way when he appears, and the haughtiest give him the wall, if he prefer it."

Dickens noted a tendency toward overdressing in the United States of the forties; and he would have had the same complaint to make of South America today. Just as this is a human trait best exemplified by the "new rich," so is it likewise an accustomed manifestation of immature social life. The women of South America have what seemed to us a marked tendency toward exaggeration of dress. It is their chief daily concern. The proclivity extends even to the children, who must be exceedingly uncomfortable in silks velvets and starched linens, which certainly hamper the business of sand piles and mud pies. Small ladies of no more than six years appear in costumes of great sophistication, designs of hat and gown being strikingly similar to those of their elders. Beauty, in any case, is not uncultivated in South America, and every aid of the chemist and the modiste goes into the habitually exquisite array of womanhood to be seen of an afternoon in the *de luxe* shopping street of Buenos Aires—the Florida—or on a Sunday at the race course in Palermo.



Above—Bolivian boy scout.

Left—Heirs of the Conquistadors in Panama.

Oval—Daughters of the Conquistadors, on the beach at Callao, Peru.

Below—Indian women of Bolivia.

It is boasted in the Argentine capital—and here is another mark of the "new rich"—that the value of diamonds to be seen on the opening night of the opera season is many times greater than that of any similar display upon such an occasion in the United States.

No better indication of the South American attitude toward clothes could be noted than the puzzled reception of occasional North American motion picture films in which the underlying theme is ridicule of a dude. To South American spectators this motive is incomprehensible, the fop to them appearing as an exquisitely costumed person of most distinguished and aristocratic bearing.

The passion for adornment, in a thoroughly Latin manner, extends further than clothes. *Plazas,* boulevards, public buildings and park statuary have absorbed vast sums of state and municipal moneys that in the United States would have gone into schools, pavements and sewers. The outlay of Buenos Aires in fountains and marble monuments can scarcely be equaled by any United States city. Dickens, indeed, were he to revisit his American cousins, might still find some ground for repetition of his original complaint:

"It would be well, there can be no doubt, for the American people as a whole, if they loved the Real less, and the Ideal somewhat more. It would be well, if there were greater encouragement to lightness of heart and gayety, and a wider cultivation of what is beautiful, without being eminently and directly useful. But here, I think the general remonstrance, 'we are a new country,' which is so often advanced as an excuse for defects which are quite justifiable, as being, of right, only the slow growth of an old one, may be very reasonably urged."

North American morals, in Dickens' time, do not appear to have been particularly subject to censure. In this respect there is a notable point of departure between the United States of 1842 and the South America of today. Masculine standards of conduct are somewhat oriental, to say the least. They list backward to the Moorish harem and to the Turkish seraglio.

It has long been the legend among visitors to South America that an unescorted woman was likely at any time to be insulted upon the public thoroughfares. The legend has been wearing down in recent years, thanks a great deal to the belligerent attitude of certain foreign residents who set out with fisticuffs to make the streets safe for their women. But in general the persistence of Spanish-Moorish custom throughout South American life confines feminine respectability to the house or to the chapel, and exposes to the amorous attentions of the predatory male any woman who does not conform to this rule.

Probably it is not an exaggeration to say that every Spanish-American considers himself something of a Don Juan. At any rate this might be inferred from the actions of a wide variety of observed specimens. Men who can afford to do so, and many who cannot, dress to the verge of foppishness. Their eyes are ranged frankly abroad for a target of feminine beauty. Not content with a glimpse in passing, there is a great proclivity for turning or pausing to inspect an exhibit of such charms in retreat. The turret neck is by no means a South American monopoly, but at least it can be said to be, on that continent, in a candid and flourishing state.

Among the most deadly of the Don Juans in our experience were the army officers who rode round and round the passenger trains, in many a small town of the high Andes, ogling the ladies, and inviting, by grace of polished leather and *caballero* manliness of pose, a compensating admiration in return. Scarcely less insidious to the feminine heart must be the godlike suavity and poise of the white-gloved, white-batoned traffic policemen of Buenos Aires.

There is, in the United States, a noxious breed that goes about greeting men of its acquaintance with hearty blows aïmed at the shoulder blades, or with clammy hand pressed to a shrinking knee. It would be better for all concerned if they were to be sent to the high Andes. There, the back-slap, like the French accolade, is an accepted custom among friends. Meetings in public and in private are made dramatic with this form of greeting, for which the following may be considered an adequate recipe: Place the chest firmly against that of the *amigo* to be saluted, at the same time clasping his right hand in yours; mutually slap shoulder blades with disengaged left hands until the desired degree of mutual friendship has been demonstrated, this being governed by no rule, but rather by usage too subtle to be readily explained. The ceremony is similar, in this latter respect, to the Japanese bow of greeting; there is an immutable but instinctively understood regulation that determines for each case the number of bows required and the degree of dorsal inflection.

Much of the traditional *cortesia* of the old-time Spanish grandee clings to the less hurried regions of the Andes; a punctiliousness of demeanor that is almost Confucian in its rigidity of prescription and observance. A better example than the form of greeting, perhaps, is the custom of mourning. The almost universal tint of black, manifesting itself even in the men's straw hats, gave the general population, for us, a striking air of bereavement.

Dickens had many bitter things to say of Negro slavery in free United States. South America's peonage system of today might have grieved him almost as much. The Spanish conquerors, many of whom were aristocrats by birth, were all aristocrats in their thorough contempt for labor. Enslavement of the aboriginal population, therefore, was inevitable. Men were necessary to operate the mines and to till the soil, and although the Indian has never been more than feebly industrious he was compelled for many generations to carry the entire burden of manual toil—a task infinitely greater than was imposed upon him by the paternal Incas. Peonage is still widespread. The burden today, however, has been largely shifted from the Indian, who is generally as indolent as he pleases. Immigrant labor and a growing body of *mestizos,* a varied mixture of European and aborigine, has taken up his former enforced task. The Spanish-American is a true son of the Conquistador. The *hidalgo* spirit, however, has carried him too far. He lacks the militant dash that would have made commercial and industrial captains of the conquerors if they had lived in this modern day. He has gone in for law and medicine, and the resources of his country have been exploited by men of North America and Northern Europe.

Constant Tinkering With Our Money System

Every Financial Step Taken Has Been Experiment, None Has Been Success

A REVIEW of financial legislation in the United States, from the beginning of the National Bank System to the present time, renders it impossible to admit the claim that financiers have a monopoly of wisdom in the Science of Money, or that there is any such science at all.

Such a review must lead to the conviction that every financial step thus far taken has been in the nature of *experiment*. Every Congress, from the inception of the idea of a delegated authority to issue currency, has found in previous laws some real or fancied defect in our monetary system, and has regularly tinkered these laws to make them perfect.

Even now a joint committee of Senate and House is about to hold hearings in various parts of the country to investigate the failure of the Federal Reserve Act to give the relief promised in 1913. The Federal Reserve System was put over as an absolutely adequate, scientific means of preventing panics and forever banishing those periodic depressions theretofore ascribed to "business cycles."

The fact is, financiers are not experts at all. They are too interested to be scientific in their attitude or methods, and the few who have seen the truth are deterred by business reasons from promulgating it.

Those who deem it necessary that Congress should delegate the power to issue money may have their views enlarged and revised by a glance at the history of the system as it has been developed up to this time.

Creating a Money Monopoly

THE First National Bank Act was passed in 1863. Prior to that time, except for a small emergency issue of government currency, paper money was confined to bank issues and depended for its circulation upon the credit of the issuing bank. Gold and silver, *being privately owned,* were withdrawn from circulation. The creation of national banking associations was the means employed to end the issue of paper money by the government, although the national currency authorized was dependent on the public credit, as it is today.

The Act of 1863 did not displace the old system, and the law never became operative. Existing banks did not flock to the system, and the tension was not relieved. The State banks continued under the charters governing their conduct, and in 1864 an entirely new act was prepared by Eastern interests and passed. This act also failed to supersede the State bank currency, and it was amended the following year. The Act of 1864 gave to National Banks special privileges and outlawed the private bank notes by placing a prohibitive tax on other than national bank circulation. State banks fought the tax as unconstitutional, until an adverse Supreme Court decision ended the dispute.

This was the initial step in the creation of a money monopoly, for it reduced the number of banks of issue by more than fifty per cent. But it created the "best money system on earth," if one is to believe the beneficiaries and the campaign platforms of the party in power. A majority of the people of the United States believed it, and credited the financiers with a knowledge of the science of money that obtains even to this day.

It has been noted that the National Bank Acts formed a step in the creation of a money monopoly. An explanation is perhaps due, as the student may not see how this can be. Authority was conferred on banks to issue currency up to a certain proportion of their invested capital, the notes being secured by the deposit of certain government obligations to insure redemption. Of the bank circulation thus authorized by government, there has never been more than sixty or seventy per cent issued, so far as we can learn. The effect is, of course, a scarcer and a dearer money, since the law of supply and demand is as operative here as elsewhere. The result has been high interest rates, and "high money" with all its consequences. Instead of an automatic increase of the means of exchange to correspond with increased production and trade, the currency volume has been fixed by the class in whose interest a limited supply is most profitable.

Coinage a Government Function

NOT only was it possible for the banks themselves to restrict the volume of currency, but the statute fixed a maximum of $900,000,000 as the limit for all National Bank issues, a feature utterly wrong in principle. The notes were issued in blank to the banks, and became money when signed and put in circulation.

The Act of 1865 provided a circulation tax of one-half of one per cent on the National Bank notes. It was the technical point that this made the ten per cent tax on other currencies general, and thus within the Constitutional powers of Congress, where a specific prohibition of other forms of currency could not be sustained.

The apportionment of circulation according to population and the aggregate limitation of currency volume provided in the Act of 1865 were repealed in 1875, being the chief of several modifications of the law in the interim. The records from then on may be studied from any annotated copy of the Compiled Statutes of the United States of 1873, and the session laws of succeeding Congresses.

Available security for the circulation redemption of the currency authorized was at first restricted to government bonds specified as having the "circulation privilege." Not all bonds were included in this class, and various amendments providing for the use of certain other obligations and of lawful money were added from time to time. For instance, the Act of 1874, which provided for the destruction of redeemed notes by maceration instead of burning, was deemed of sufficient importance for Congressional action.

No material modification affecting National Bank circulation was made subsequent to 1874 until 1882. In the Act of the latter year, banks capitalized at $150,000 or less were not required to keep on deposit in the Treasury bonds to exceed one-fourth their capital stock to secure their notes in circulation. This act also limited the amount of National Bank notes retired in any one year to $3,000,000. This is evidence that even at that date the process of deflation was felt in the depression of business.

The above rehearsal brings us to the Act of 1900, by which a drastic revision of the whole banking law calculated by its sponsors to perfect the whole system was undertaken.

The policy of a mutual guaranty of circulation, where each bank is assessed to form a guaranty fund for failed banks is now looked upon as an innovation of great danger to sound business. It will be news to many that the matter received the recommendation of a commission comprising the most noted financial experts of a quarter of a century ago.

The Act of 1900 was the culmination of an inquiry that involved much time and study, and that in all respects it did not follow the details recommended will be attributed by suspicious minds to the activity of the "invisible government" of the money trust. It was doomed to failure, too, for at once came the agitation, academic and with such object lessons as the bankers' panic of 1907, for the Old World system for one central bank of issue, independent of and in no degree responsible to the general government.

The Civil War between the States (1861-5) may justly be designated as the beginning of bank domination in the United States. Prior to that time the government had assumed no jurisdiction of banking, President Jackson's defeat of bank domination having apparently settled the policy of the republic to the simple declaration of what should be the basis of money. This was gold and silver, both coined on private account.

Under the Constitution, the coinage of money and the establishment of its value was made a government function. The article which vests the money function in Congress is confined to the section which reads, "Congress shall have power to coin money and regulate the value thereof, and of foreign coin, but a reading of the article in full impliedly makes the issue of currency or bills of credit a government duty, by forbidding the issue of currency or emission of bills of credit by any State.

This ambiguous language of the Constitution has been uniformly construed by the Supreme Court in accord with the implied authority of the government to issue money, and there is no doubt in the matter.

Banks of issue, under state charter, provided the paper currency in use before the Civil War. Of course there was no power to make their notes a legal tender, and in circulation they were subject to discount and exchange, a matter controlled by the banks themselves.

These issues should not be confused with what was known as "wildcat money." One New York bank to this day boasts that during its wildcat period its notes were universally accepted while money issued in other states was refused in the East and South and especially in New England and in foreign commercial centers.

People Constantly Chloroformed

EARLY in the Civil War, President Lincoln's Secretary of the Treasury, Salmon P. Chase, recognized the necessity of a legal tender which should be accepted all over the country, and in his first report to Congress (1861) recommended a national bank system, empowered to issue a currency based on bonds issued by the government. A bill was introduced in Congress, but Thaddeus Stevens, chairman of the House Committee on Ways and Means, to which the matter was referred, was opposed to the establishment of a bank currency, *maintaining that the government itself should issue its own notes.*

Secretary Chase renewed his recommendation for the passage of the National Bank Act in his annual report for the following year, and was supported by President Lincoln, but action was delayed through the emergency resulting in the issue of the Treasury Notes and the Congressional authorization of the United States Notes so familiarly known as greenbacks.

The principal argument in favor of the National Bank System was Mr. Chase's belief that it would greatly facilitate the negotiation of United States bonds —in other words, make it much easier *for the government to borrow money.* It was also claimed it would secure for the people in all parts of the country a currency of uniform security and value, and protect them from loss in discount and exchange.

The same arguments have been used in every change of the banking and currency systems proposed. It is "for the good of the people." Money reformers have not succeeded because the people are not left to their own Constitutional solution of the question, but are chloroformed while the same financial surgeons continue to operate on the body politic.

We of the present day know something of the orgies of profiteering in a national extremity, and are prone to think the world is worse than it was sixty years ago. Bad as it is, every offense in the career of greed we know of had its forerunner in the days when the nation was periled by fraternal strife. One of the worst chapters in our whole history could be written of this period and the same interests which now threaten the country contributed the menace of that day. The devious program of usury gained power over the financial legislation of the Civil War period, and culminated in the surrender under protest of Lincoln, Chase and Stevens. The President was assassinated. There is no doubt of his intention, had he lived, to make High Finance the next object of Abolition after Chattel Slavery of the Negroes had been accomplished.

After having passed both branches of Congress in 1863, the National Bank Act was revised and again put through Congress, becoming a law in 1864, the final vote being in June.

In spite of the boasts of its friends that the National Bank Act is a scientific and practically perfect financial measure, the passing years have witnessed many minor changes in it, and finally an entirely new law was proposed. While this was not adopted in its entirety, a résumé of its features may be of interest, especially as its sponsors were men of fame as financial experts, including Senator Edmunds, Secretary Fairbanks and Professor Laughlin.

These men were in a committee deputed by a monetary conference to prepare a financial system that should improve the National Bank System to a point beyond criticism. How well it was done is indicated by the fact that within a few years it was deemed necessary to reorganize the whole banking system according to the views of Paul M. Warburg, which, after being rejected when Senator Aldrich was its spokesman in the Taft Administration, finally produced the Federal Reserve System.

How many readers of THE DEARBORN INDEPENDENT remember that less than a quarter century ago, in 1900, the "best money system on earth" was adopted?

New Steps to "Reform"

THE story of the Monetary Reform Act of 1900 forms an interesting chapter in the fiscal history of the United States. The demonetization of silver in 1873, and its partial nullification by the Sherman Act requiring that certain amounts of the metal be coined on government account, had partially mollified the discontent of the masses, but it had also checked the profiteering incident to the establishment of the gold basis. International financiers had reaped the full benefit of the fiat which added more than a third to their Greenback hoardings, and were now seeking other means of usury.

The close election of 1896 brought a realization that the voters of the country really favored the principles involved in the protest which had overthrown the Cleveland faction in the Democratic party, and this inspired immediate steps toward monetary reform.

In 1897 some 300 money experts gathered in conference at Indianapolis to discuss the system then in operation, learn its faults and prepare a perfect plan for recommendation to Congress. The call was issued by the Indianapolis Board of Trade, and was responded to by representatives of similar organizations from all parts of the country.

To recount the principal points in addresses and papers at this convention reminds one of the oratory at bankers' conventions or at political reform meetings of today. They included:

"The Greenbacks should be retired."

"National Banks should not be restricted in power of issue except by the total of bonds deposited to secure circulation."

"The country needs a stable tariff and a stable currency."

"Prosperity can only be restored by the establishment of a sound currency."

"The Government should base all its currency on the gold standard, replace all notes with coin certificates, and protect the currency volume with a twenty-five per cent reserve."

"Government should withdraw from banking business."

"Government should establish a postal savings bank."

The reader will see that it was really a call for some legislation to "restore prosperity," and that the delegates had some familiar ideas.

The result was the appointment by the organization of a monetary commission charged with making a comprehensive investigation of existing currency laws, urging a currency reform measure on Congress.

A second conference, at which the report of the commission was made, was held in Indianapolis in January, 1898, the report being unanimously adopted. It contained 39 specific recommendations.

Gold Standard Maintained

A BILL, based on the report, was introduced in the House by Representative Overstreet, of Indiana December 4, 1899, and on the eighteenth of the same month was passed. In the Senate, after considerable amendment, the bill was passed February 15, 1900. The House refused to concur in the Senate amendments and it went to conference. An agreement was reached and on March 13 the act was passed as amended.

The new law maintained the gold standard, provided for the maintenance of the legal tender quality in silver and other currency as before, provided for the substitution of silver certificates for treasury notes, their reissue under certain circumstances, the creation of divisions of issue and redemption, the refunding of bonds at not to exceed three per cent, the new bonds to be fully tax-exempt, the maintenance of a gold reserve of $1,500,000,000 for the redemption of treasury notes, and so on. Perhaps the most striking feature of the act is the last section, which recited that its provisions

The Rise of a Better Drama Sought in Boston

Copley Repertory, 47 Workshop, Little Theaters, Hopeful Signs of the Times

By MAY B. WHITING

WITH our French theaters, Italian theaters, Yiddish theaters, and imported Russian and Chinese theaters, why not support an English-speaking theater? A few seasons ago a writer, dealing with the situation in New York, made a plea for just such an institution, where the English language should be spoken, not mouthed, and the purpose of which should be to present a play, not to exhibit a star. With ninety per cent of the theatrical business of the country in the hands of a few men, the majority of whom have tastes and ideals not wholly American, the public is forced in large measure to accept such amusement as is set before it, or stay at home. Here and there brave institutions, notably the Repertory Theater in Boston, are striving to restore the drama to its rightful place among the fine and noble things of life.

Professor George Pierce Baker, of Harvard, shown in the center of the seated group, has with his associates done much for playwrighting. At the left is shown a 1923 production of 47 Workshop, Professor Baker's class.

In 1916 Henry Jewett came to Boston for a season of Shakespeare. The next autumn he took over the Copley, then idle, and began repertory work. Friends of the drama watched with interest the new venture, not a few prophesying failure for an undertaking so at variance with the idea, fast being ingrained, that the stage was the place to indulge vulgarities that would not be tolerated in the home. Today the Copley is one of Boston's most distinctive institutions. It is the only repertory theater in the country and is known in every land where the English drama is loved and appreciated.

The Repertory Theater is very different from a stock company where every member has his "line" as lead, character, or ingénue, and he is always cast in a similar rôle.

The Repertory is democratic in its working; each actor has an equal chance and plays the part best suited his personality or talents. There is no leading man or lady, and, in the Copley, no actor accepts a curtain call. Here not personality but "the play's the thing," as Shakespeare advises, and the company responds as a whole.

Quite unlike the ordinary commercial theater, the Copley makes a serious attempt to build up a permanent clientele and to bridge over that chasm which a few feet before and back of the footlights seem to make.

One of the chief factors for friendship between the theater and its public is the Frances Jewett Repertory Club, named in honor of Mrs. Jewett, whose unselfish labors and unfailing enthusiasm have swung the project along over many a dangerous shoal. This club, starting with seven members, has now almost 2,000. It meets monthly in the theater. Affairs of the organization are discussed, and members of the company present a dramatic entertainment. Frequently, after matinee performances, tea is served in the clubrooms, and actors and audience meet for social intercourse. Edwin Booth, in founding the Players Club, in New York, had much the same purpose, for, as he said, actors commonly associate too much with each other, and friendship with people outside the theater, yet in sympathy with it, makes for a better drama.

Working in such an organization, the actor has a chance to make real friends, and to take the place that belongs to him in the respect of the community. No doubt constant association with the lofty sentiments of Shakespeare helped to mold the noble characters of our older school of actors, and the Repertory players come under a similar influence, for the Copley aims to produce works that are not only plays, but literature. John Drinkwater, author of "Abraham Lincoln," gave it as his opinion that the list of plays produced by the Jewett Players was the finest offered by an English-speaking theater.

Again, the repertory idea gives the actor unusual opportunity to develop. In stock, a leading man, with constant rehearsals and the strain of always memorizing difficult rôles, has little chance for thoughtful study.

In repertory, while he is playing a minor part, the actor can put real work on the next production, as Mr. Clive, in preparation for the part of Dr. Jekyll and Mr. Hyde, visited the padded cells of Charlestown for facial expression.

The work of Mr. Clive shows the advantages of repertory training. From light, humorous parts, for which his talents at first seemed to cast him, he has given remarkable interpretations of such characters as Roberts in Galsworthy's "Strife" and Eilert Lovborg in "Hedda Gabler." Catherine Willard, another member of the company, has become an actress of unusual versatility and power. Her impersonation of the title rôle in Hedda did much to justify the criticism that the Copley production of that difficult piece was the finest ever seen outside the land of the Norwegian dramatist.

The secret of repertory success is, of course, the subordination of personal brilliancy for a harmonious whole, and in the general air of unity and smoothness of action one feels a welcome relief from the commercial theater where the play is too often jerked along by the successive appearances of the star. Perhaps the ideal would be a community theater—when we have an ideal community to support it. In the meantime the Repertory Theater is helping the situation wonderfully. The organization now owns a fine piece of land opposite Symphony Hall on which to build a commodious theater and clubrooms, and once established in its own home, its influence will shine more brightly, "a brave deed in a naughty world."

The idea of co-ordinating audience and players is not confined to the Jewett Players. The 47 Workshop, Harvard, a course in playwrighting under Professor George Pierce Baker, which has produced amazing results, unites author, producer, scenic artist, actor and audience into one organization working together for a common end, a better American drama.

Yet there are only about a dozen students admitted to the course, and as many at Radcliffe, where the work is duplicated. Associated with them is another group of varying number who are studying scenic art and who design the sets for the Workshop productions. About forty persons, many of whom have had dramatic training, comprise the company and from these the actors are chosen.

The audience numbers about two hundred, and are required, as a condition of membership, to send in a written criticism of the performance. In the light of these criticisms the play is revised in the Workshop, and a second presentation will perhaps be given, this time for the public. Theatrical managers watch with interest the Workshop productions and here many of the successes of the following season are chosen.

From the very first this practical course showed results in the professional drama. Edward Sheldon, of the first class, distinguished himself with "Salvation Nell," following with "Nigger," "The Boss," and the ever popular "Romance." Eugene O'Neill is perhaps the foremost figure of the American drama today. Three times he won the Pulitzer prize for dramatic composition, first with "Beyond the Horizon," then "Anna Christie," and "The Hairy Ape." To name all the successes of the 47 Workshop would be too long a list, and, in passing, some mention should be made of their one-act plays. "The Clod," a sensational one-act, was produced by the Washington Square Players, and "The Florist Shop" never loses its charm for amateurs.

The Workshop itself, situated in Lower Massachusetts Hall, once barracks for the colonial army, is a most interesting, yet baffling, place to visit. Its tiny office, not much bigger than a wardrobe, attends to all the affairs of the organization, and keeps in touch with past students, even to handling their royalties, no small matter with the large number of their productions now playing.

Leading from the office is the Workshop proper, a place indescribable except by the name so happily chosen for it. Scenery in stacks, gauzes, drops, odds and ends of lumber, pots of paint, a few chairs, a dummy nonchalantly swinging by its neck, complete the equipment. An unpromising place enough to the uninitiated, and unconsciously emphasizing in true dramatic relief the genius of the man who presides, Professor Baker, whose untiring labors have done so much to change the whole dramatic situation and whose example colleges everywhere are striving to emulate.

Like many other cities, Boston has its Little Theater groups, half professional, half amateur, who are constantly working for a better drama. In 1912 the first Little Theater in America appeared. The summer before. Mrs. Lyman Gale had been interesting a few sincere lovers of dramatic art in the project and on New Year's Day the Toy Theater opened in a remodeled stable on Beacon Hill. It was planned along much the same lines as the *Theatre Libre* in Paris and the Abbey of Yates and Lady Gregory in Dublin. It seated only 127 persons and performances were by subscription. Humble as was its beginning, the Toy Theater marked an epoch in American drama. Today there are Little Theater groups in almost every state, many of them doing excellent work.

One of the most interesting of these associations is the Boston Stage Society, already outgrown the Peabody Play House, which shelters a number of others, and is now preparing itself a home in the Brick Oven Colony.

The Brick Oven is itself a most fascinating spot in the most romantic part of Boston, Beacon Hill. It is a sort of story book affair, a colonial house a bit eccentric and lopsided, with old-time fastenings on all the doors and windows, crooked stairs, a fireplace in every room, and a brick oven beside the chimney. Close by, in the court, are two other houses, perhaps a trifle less old and a shade more dubious looking, with ship lanterns over the door, and through the tiny window panes, fascinating glimpses of gay batiks, easels, presses, and the many-hued costumes of a theatrical designer. For the Brick Oven is the home of artists who are delightfully in love with art, and who, in this enchanted nook, find a refuge from the disillusionment of life.

In such an atmosphere the Boston Stage Society will have every chance to prosper. The stable that went with the house in the days of its colonial grandeur makes an excellent theater, seating about 150. Before such a sympathetic audience as the Hill can furnish, the society can produce dramas of the direst problems and darkest tragedy—deep works which only youth can properly understand or interpret.

All this is a most promising sign of the craving for a wholesome drama in our national life. The dramatic instinct, revealing itself in the earliest play of children, will not be denied in man, and instead of degrading the morals of the community, the stage should inspire to nobler, kindlier purposes. To this end, it is more powerful than novels, pictures, monuments, enduring as they are, for no art can be so vital as that of the spoken word.

Five Men in a Newspaper Boat That Sank

In This Is Related the Story of the Failure of a Truth-telling Policy Instituted by a Group That Sought to Print the Honest Word

By a Newspaperman

"NO MAN wishes to write unless it is possible for him to have some honest word about that which he writes."—"Mr. Ford's Page," THE DEARBORN INDEPENDENT, July 28.

There were five men—a managing editor and four college-trained assistants—who yearned for the opportunity to write and print the honest word. So they acquired the opposition newspaper in their Eastern city of less than 50,000 population, a city that was just emerging from a restful past into the newer industrial life. The transition from steady jobs on the standpat paper to an environment of independence was a plunge taken with a zest inspired by an ideal.

"We will give our people the whole truth about everything and work for the community's best interest, always with righteous intent and in good nature." The five stood unanimous on this platform.

The paper received the Associated Press report of some 15,000 words, and printed practically every dispatch that came over the leased wire. It had a large, loyal and hard-working staff of county correspondents, and the new management engaged as legislative correspondent a well-known writer for a leading newspaper at the state capital who was instructed to be frank, honest and fair in his reports. And he followed instructions.

The policy of independence in weighing facts and of telling the truth literally in news reports was adhered to from the first issue under the new control. The leading editorial was always written on a local, county or state topic. The paper was improved typographically and scare heads tabooed, the purpose being to fill the columns with a daily feast of genuine news.

The Beginning of the Boycott

A CHANGE in the form of the municipal government was the initial reform espoused by the new paper carrying on under a name that had headed its first page for more than thirty years. The city was subdivided into five wards, which elected three aldermen each and the whole city voted for three aldermen-at-large, the term being one year. The mayor and minor executives were elected for three-year terms. The ward system had brought about a steady increase in the municipal tax rate, traceable to the fact that the aldermen formed trading combinations within the board. If the first ward sought some public improvement within its boundaries, the first ward aldermen "traded around" for sustaining votes and in turn pledged their support to localized enterprises in the other wards. This "tickle me and I'll tickle you" scandal was of many years' standing, the two local newspapers evading it by merely reporting the votes of the board briefly in running stories of the monthly aldermanic meetings.

This scandal was vigorously assailed and lucid statistics printed showing the constantly rising tide of taxation for specialized improvements that were of little benefit to the community as a whole. A change was demanded to a commission form of government, with six commissions elected at large, each to be the responsible head of a municipal department. This campaign of education in intolerable taxation on the one side and commission government on the other for the city's redemption and relief won the taxpayers' hearty approval, given by letter and in person. But the business men were extremely backward in showing tangible evidences of enthusiasm. The biggest advertiser in the city, who conducted a department store using page space daily in the standpat paper, when I personally solicited his business, patted me on the shoulder and said: "You are getting out a fine paper. Keep it up and some day I'll simply have to buy space from you." That "some day" was the slogan of nearly every liberal space buyer up and down the main business thoroughfares. It gave reasonable ground for suspicion that they had agreed to tolerate us with that sort of vague promise in the hope that eventually we would listen to reason and give ideals a permanent vacation. It is unquestionable that the reason behind this mild boycott of our columns was the fear of the average merchant of every municipal official and employe and of their friends—fear of arousing displeasure and loss of trade by lending support to our opposition to things as they were in giving us their advertising business. The contractors' ring made that fear real to the merchants, for we lost a column of their business cards and nearly every cancellation notice carried the message that "Commission government is the bunk," or words to the same effect.

Circulation Shows Growth

THE circulation of the paper mounted steadily, however, and our group of five idealists was certain that the circulation eventually would pull the needed business. Our educational campaign went on with undiminished enthusiasm, yet no civic organization—the city had a full complement under the various popular forms—indicated the least interest in our purpose to relieve the tax burden and abate the waste of public funds. The paper was making a good fight in the center of the ring, but our group soon learned with sorrow that popular support at two cents a copy for the paper was not paying the costs of publication. A change was advised, so we compromised by simply printing every day a "box" feature on commission government, without editorial comment.

The editor of the small city newspaper who is adept in "rolling over and playing dead" while the "reg'lar fellers" play percentage with taxpayers' money, can always count on steady returns from local big-space buyers. His newspaper employs an advertising manager merely to fill in the chinks with small stuff advertising.

Newspaper policy is no longer competitive. It has become stabilized into "Be good and get the business."

The bipartisan color of the regulars in municipal politics tinges every public and semi-public activity and interest. Only the trustful citizen is deceived when, by casting his vote under a party name, his ballot is counted either for the "tickle me" or "tickle you" elements of the gang. As a general proposition the result of a small city election is "all even" no matter whether the "ins" stay in or the "outs" get in.

The police department of the city was an outworn organization recruiting new strength from a reserve list of men appointed by the aldermen. The head of the department had been the commander of the state troops. He needed the salary, but held the position to be beneath his dignity; so he put the real work on the shoulders of the next in rank and took it easy. The conditions at headquarters and in the precinct stations were on a happy-go-lucky status—happiest after periodical raids of the "outlaw" places of ill repute. The treatment of prisoners taken in these raids, particularly the women, was on a cash basis for favors, and bail-bond running had almost become a recognized function of the department personnel itself. At the same time the "better class" resorts were liberally patronized by youths in the "allowance" class—a wild lot that had the run of the town every night they decided to have a party. They were immune from arrest, and so were the favored resort proprietors. In fact, hackmen and police officers, when these youths were too drunk to stand, saw that they were taken home or to some hotel which catered to this business.

The Political End of Things

MOREOVER, the foreign colony was kept under strict repressive rule, and a wedding celebration was always countenanced, because the usual ratio was one arrest to each keg of beer consumed by the celebrants. The police court, from judge down the line, was a roster of favorites with the local political ring, which knew no partisanship, although it did use party designations over the names of candidates on the municipal ballot. Small fines and exorbitant costs were the established police court rule, and presentation before the bar was equivalent to conviction in the case of minor infractions of the law.

The police situation was attacked by our paper from every possible angle, and the removal of the inefficient officers demanded. One young alderman, suspected of training a mayoralty bee, took up the cudgels and forced an investigation. The result might have been foretold when the aldermanic police committee sat as the tribunal. It was a whitewash for all concerned, a clean bill of health for the police chief and his lieutenants, and a crushing defeat for the young alderman at the next election. Our newspaper, however, continued to print the facts of police administration. In reporting police court convictions we stated the fine in each case and gave a detailed statement on the distribution of the "costs." The morale of the police department did rise for a time; but the chief was stricken blind whenever any one of us came within talking distance of him. The favored wild youth continued their nocturnal carousings, until local society was shocked by a notorious woman's claims to a welcome into one of the leading families by way of a marriage certificate that enmeshed an only son. Our paper told the sordid story without embellishment. The standpat paper didn't print a word about the case. Society thereafter classified us as a "scandal sheet"—and business took the cue from its charge accountees. Well, we had more room in our columns than ever to devote to the news.

From our initial issue the paper gave generous space to every commendable and progressive local activity and printed special feature articles descriptive of social, mercantile and industrial enterprises. It boosted them harder from a space as well as an editorial point of view than it demanded reforms of local evils. But we did cling to the honest word policy tenaciously.

The ramifications of local politics were traced along every tangent, and our readers were fully informed of events as they transpired and given leads for their own interpretation so that they might anticipate results. A choice morsel was an exposure of a city official who was a large landowner. Evidently without feeling a single twinge of conscience, this official had not alone used the city's public works equipment to improve some of his low-lying lots, but he took the city's filling material, including sand from the city's lot. When exposed, the official declared he had arranged the matter with the department of public works, for future settlement. The head of that department at first shied from answering our specific charges, but finally he declared that he had made a verbal contract with the city official. The work was paid for eventually, but not before the newspaper felt the weight of displeasure all along an extensive line of municipal favorites.

Our correspondent at the capital was alive to his opportunities. A United States senatorship was a prospective plum, ready to serve when the honorable incumbent retired on account of age and disability. The legislature was solidly of one party, but split into three factions. Our correspondent penetrated to the inside of the state machine and told the story of the checker game maneuvered to send to the Senate the son of a wealthy manufacturer. This son had been a non-resident for many years, and it was common knowledge that he had done well in big-city finance. The story was denied from every part of the state, and every means was employed by the ring's representatives to learn the identity of our informant. We did religiously protect our correspondent, for his stories were printed as though written in our own editorial department. Well, the story was proved accurate by the legislature, which put over the non-resident for United States Senator. The state business in legal notices and abstracts of laws, however, never thereafter came over the counter in our business office.

Tells Truth About "Sales"

THERE was another political fireworks celebration when the paper attacked a candidate for governor who as a representative in Congress had made sensational charges of graft in connection with government contracts. This man was repudiated when an investigation of his charges collapsed for want of evidence. To the state machine he was, nevertheless, *persona grata*. He got into the governor's chair by a fair majority, served one term characterized by truckling, and then sank into political oblivion. The word our newspaper printed about the undesirability of electing this type of man to the governorship had been once again confirmed as honest; but it did not earn us any dividends.

Business as usual with the standpat opposition paper had been the rule all through the year of honest word effort. Occasionally we were thrown a bone in the shape of a page or a half-page advertisement for some "clearance" sale. But we spoiled even this source of income by exposing a "clearance" for what it was—merely the unloading of shoddy goods purchased for a killing with the unwary consumers as the victims. We had, by this time, built up a healthy line of business in the country with advertisements of sales of land, farms, domestic animals, and so forth, and by selling space to big-city department stores doing a mail-order business.

And Then the Boat Sinks

INCOME, however, never did balance outgo, and debt was mounting at the rate of $250 a week, although we all exercised the strictest economy. The independent five had been untiring in work and apathetic to hours of effort for eighteen months. Our loyalty could be measured by the fact that several of us had recovered and were wearing last year's discarded clothing. The struggle was telling on us all physically, though our good nature was still at par and our faith secure. In the darkest of our days a ray of sunshine broke through the clouds when I talked with a banker friend of the possibilities of finding a loan to tide us over the fighting period. He supplied the source of relief—a capitalist engaged in business of national proportions. He promised money and he produced money. But along with the loan came demand for collateral not less than practically the entire newspaper property and absolute control of editorial policy. We five talked it over, sought to develop other sources of support and delayed giving a decision. We did come to it at the end of two enervating weeks. We realized that it was the honest word and collapse on one side of the scales, and on the other side money to meet our personal and business needs—just a living, and hack work following "orders" that comprehended nothing of the ideal.

Our newspaper boat was on a rough sea and the five men on board were without oars. We accepted the inevitable—and sank. The newspaper property was sold by our creditors. The financier bought it, ran it at a loss, sold to another man of wealth and soft living. The latter used it as a plaything, soon tired of it, and inside two years the plant of this ambitious disseminator of the honest word was scattered by dealers in second-hand newspaper equipment. Two of the five of us still hold newspaper jobs—the law and social service have claimed the other three. The work of those eighteen months was not wholly in vain, however, for that city now has government under the city manager plan, and very many of the local and county betterments our group of five idealists sought to gain for the people are now realities.

Yes, space buyers and others are peculiar!

The Golden Stream Flowing Northward

Half a Billion Dollars Spent in Canada Each Year by American Pleasure Seekers

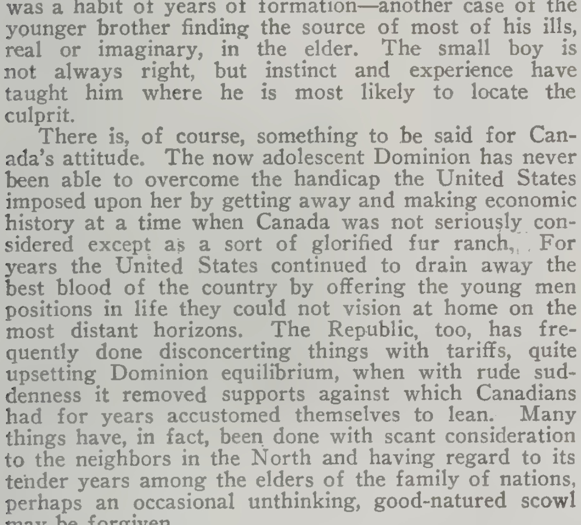
By E. L. CHICANOT

Observation car in Canadian Rockies.

UNTIL not so very long ago it was the natural inclination in Canada, when things went wrong, when the national economic machinery developed engine trouble, or the average productive citizen, who might be of any nationality, acquired the conviction that he was not getting his dues from life, to turn toward the international border and give the neighbors across the line a dirty look. It was a habit of years of formation—another case of the younger brother finding the source of most of his ills, real or imaginary, in the elder. The small boy is not always right, but instinct and experience have taught him where he is most likely to locate the culprit.

There is, of course, something to be said for Canada's attitude. The now adolescent Dominion has never been able to overcome the handicap the United States imposed upon her by getting away and making economic history at a time when Canada was not seriously considered except as a sort of glorified fur ranch. For years the United States continued to drain away the best blood of the country by offering the young men positions in life they could not vision at home on the most distant horizons. The Republic, too, has frequently done disconcerting things with tariffs, quite upsetting Dominion equilibrium, when with rude suddenness it removed supports against which Canadians had for years accustomed themselves to lean. Many things have, in fact, been done with scant consideration to the neighbors in the North and having regard to its tender years among the elders of the family of nations, perhaps an occasional unthinking, good-natured scowl may be forgiven.

What people on both sides of the border know too little about is the manner in which the United States at the present time is making recompense, what she is doing now to promote the Canadian development she was accused, rightly or wrongly, of hampering. This action is not in the least altruistic, or actuated to any extent by motives of just restitution. United States citizens are doing it because they want to, because they find it profitable or enjoy it. The main thing is that it is most certainly being effected. At the present time there is a very voluminous cornucopia, with its big end on the Canadian side of the border, from which are pouring a dozen different healthy streams of very rich content.



Chateau Louise, Lake Louise, Canadian Rockies.

The confluence of the streams results in a golden flow calculated to rouse the envy of a Croesus, while there are so many little trickling currents that it is a matter of great difficulty to estimate the power of the deluge. This is the movement of American money to Canada, which has gathered momentum every year since the war, has been rapidly overtaking the volume of British funds, and is now running it a neck-and-neck race.

In the years before the war the money responsible for Canadian development was overwhelmingly British and the American discovery of Canada had not yet taken place. American funds became available as soon as British were shut off in 1914 and investors from across the border have been doing their level best since to reach the substantial British sum and will probably attain their goal this year. In 1919 the total investment of United States funds in Canada was variously estimated at from $1,250,000,000 to $1,600,000,000 with British capital double this. In 1922, according to a pronouncement in the Federal legislature, British capital in Canada was about two and a half billions and that of the United States two billions.

It is perhaps surprising to find one of the biggest items in investment in Canada to be attributable to the ordinary, everyday citizen making provision for a rainy day and using Canada instead of the old-fashioned stocking. His contributions in 1922 constituted a record for American investment in Canada and went a long way toward equalizing American and British funds. The total of Canadian bond sales in the United States in 1922 was more than $261,000,000 or $37,000,000 in excess of the previous highest figure reached in 1920. If we add to this investments of a general nature, other than those represented in the sale of bonds, $300,000,000 may be accepted as a very conservative estimate of the year's investment of American funds. And the indications of the first months of 1923 are that the 1922 record will this year be left behind and United States investments be supreme by 1924.

A very rich stream is that of industrial capital, the approximate volume of which there is unfortunately no means of estimating. It is well known that many of the foremost Canadian industries are financed out-and-out by American capital, but since the war the most pronounced feature of Canadian industrial development has been the establishment of branch plants by United States firms. Under this system the offshoot of the American house functions as a Canadian industry which, to all intents and purposes, it is, even to name. It is in a position to enter into the domestic and export trade of the Dominion, the latter embracing forty-four countries with some of which Canada has inter-Empire preferences or favored-nation treaties. The first firms who discovered these advantages spread the news around and the movement is gathering fresh impetus every day as others hear about it. The amount of money brought up across the border in this manner is considerable.

One of the outpourings of the horn upon which Canada gazes with the utmost gratification and much friction of hands is the American immigrant. Though, since the war, the tide of immigration has declined in volume by something like one-third, it is of the same rich constituent which has gone a long way in peopling the prairies. The American has always been Canada's richest immigrant. In the past few years the average annual contribution of the United States to Canada has been about 50,000 until 1922 when only some 24,000 arrived. Judged in monetary terms, however, each was worth three or four from other countries. In 1919 each newcomer to the North brought with him $342; in 1920, $372; in 1921, $312; and in 1922, $402. Thus, not taking into account the inestimable value of these new citizens to Canada in future years, they added to the wealth of the Dominion in 1919 by about $14,000,000; in 1920 by about $18,000,000; in 1921 by $14,000,000; and in 1922 by about $10,000,000.

American tourists at Banff, Alberta.

A startlingly different human flow from the same horn is that holiday tide of people pouring up during the summer months bent on absorbing Dominion scenery, reveling in its spots of historic and romantic association, or merely disporting themselves in its lake and mountain fastnesses. They scatter their money around in a manner that seems quite promiscuous but probably isn't, merely appearing lavish to a Canadian mind.

The monetary value of this tremendous traffic is difficult to estimate. In the Dominion metropolis it has been calculated that American tourists to the city in the summer months leave between $6,000 and $7,000 a day in places where they never see it again. In the same brief season last year visitors from many states left nearly $20,000,000 in the Canadian national parks. Of the crowds that pour in by train, half of them to rush through from Montreal to Vancouver and feast on a most unprepossessing right of way, it has been found impossible to keep record, or follow them sufficiently closely to see what money they spend. They are at least equal in numbers to the horde of visiting motorists who before they returned to their homes last summer had been separated in the most cheerful manner from $108,000,000.

Before the first touch of frost has tinged the maple the last of this glad throng is back in his steam-heated apartment. Flaming maples, however, herald another issuance from the golden horn. It is the sturdy band of sportsmen and hunters who incidentally cannot move without percolating money. It is estimated that the visiting sportsmen spend well on to $1,500,000.

The amount of money finding its way into Canada from across the border is tremendous. With due conservatism it can be stated that an amount of money in excess of half a billion dollars was transferred from the United States to Canada last year.

If the United States, while achieving her own meteoric growth, was responsible for hampering the development of her northern neighbor, as was very largely inevitable, her citizens now are making recompense. The superfluous rich, economic blood from the older and stronger country is being transfused to the veins of the younger and weaker.

Bringing home the trophy.

Diamond-back, Not Mossback Conservatism

Politics Rank High in Maryland and "Regularity" Marks All Activities

By AARON HARDY ULM

MARYLAND, O my Maryland, how regular! Regular in thought, in manners, in ideals, in morals, and above all in politics.

Here are all the peoples, almost, both domestic and foreign, and soil it would seem for the sprouting and nourishing of all the varieties of social and political thought.

In the beautiful mountains of Western Maryland there is a large mining population, possessing some of the labor consciousness that goes with the handling of picks and automatic drills. But here even that condition is inwardly, almost romantically, different. The mining population made up in the main of old native stock of English and Welsh origin has little psychic kinship with that of, say, Herrin, Illinois.

Dropping from the mountains into the entrancing valleys and billowing hills of Central Maryland you discover a farming population which lives in Colonial mansions and thinks in terms of the gentleman farmer of a century ago. It also is of that old stock which has survived here, with a purity and predominance, scarcely to be found elsewhere in the country.

Then there comes Baltimore—"the city"—with its three-quarters of a million variegated population, and marks the dividing point between the Eastern Sho' and Southern Maryland. Those two regions are bisected by the great Chesapeake Bay, which is both an inland sea and vast ocean gateway. On one side, the Eastern Sho' side, is another rich agricultural region, with families still occupying mansions erected by pre-Revolutionary ancestors with truck and sea food contending for first place industrially. On the other side of the bay you find the bulk of the state's Negro population and its more or less typically Southern Whites, where the tradition of Catholicism that began with the state's founding holds on among an old native element.

These sections, so cut apart by mountain ranges and wide and widening waterways and so eccentrically situated that several of them are only indifferently pierced by railroads, are bound together by the best system of public highways to be found in any state.

They are bound together, too, by certain tendencies of mind which pervade all and set Maryland more or less apart.

The most noteworthy is conservatism, a diamond-back more than a mossback conservatism. While it is marked by a feeling for practical progress, it is intolerant of modern isms and of that brand of agitation which emphasizes "re-fawm."

Politics a Game in Maryland

HERE politics rank high as a sport for blue blood. Marylanders pursue and follow the sport as a game; they take much pride in keeping up with the intricacies of the state's political texture, through which run strands which go back to the Civil War and beyond. It is an orderly designed but complicated texture; so tenuous that it probably would often break under modern strains but for a binding cement of political organization that is here notably supreme.

This political organization revolves around the old parties, which, barring the power of ancient sentiments, are in Maryland scarcely more than the "Ins" on one hand and the "Outs" on the other.

At present these organizations are animating their forces for a gubernatorial campaign which will be decided this autumn. The fight will be about as pantomimic as a framed-up battle between two pugilists; the decision will mean about as much to the average Marylander as the course of some star of the fifth magnitude.

And yet the average Marylander will not fare as badly as in some other states where party battles merely result from the necessity for electing somebody to office.

It is true that the two candidates-to-be—the present governor, Albert Cabell Ritchie, for the Democrats and Attorney-General Alexander Armstrong for the Republicans—differ on essentials about as much as two peas in a pod. They are of about the same age, the same social and professional derivation, the same ardent devotees of what is regular, the same staunch supporters of progess as measured by public roads and schoolhouses, and given to the same political hesitancy as to issues in the forefront of the public mind.

Neither, for example, is likely to take any decided stand on the wet and dry issue or the continuance of unrestrained race-track operations in the state. Yet they are the two state issues about which the average Marylander gets most excited.

Race tracks and "wetness" are the two blots, or the two liberal lights, depending upon each individual's views as to prohibition and "playing the ponies," on Maryland's political landscape.

The state legislature, with painful face, ratified the Eighteenth Amendment—and stopped. Since then its attitude toward prohibition, as before then, has been "wet." It has failed to give any legislative support to the Volstead Act.

Horse-racing of the Old Style

MARYLAND also is about the only state which still countenances horse-racing of the old style—the kind where the touts are in full glory and one can bet his head away if he so wishes. There is considerable demand that their operations be at least curbed—a demand of which the parties as such, and gubernatorial candidates, seem utterly ignorant.

"County" sentiment, expressing itself directly, may soon force a change of attitude toward bootlegging and race-track gambling, whatever may be the sentiment of the true majority of Marylanders.

For Maryland is only partially a popularly ruled state. While popular majorities count in regular elections and in local primaries they have no binding force in state-wide primaries, as for governor or President. In these the "unit rule" governs, which gives the rural districts a power exceeding that going with mere numbers, and puts into the hands of the regular politicians a means by which they can keep the party organizations under their own control and make of the primary a mere field for occasional battle between the politically elect.

This state of affairs, together with Maryland's traditional conservatism, renders political insurrection here about as hopeless as revolt in Haiti with Uncle Sam's Devil Dogs on the job would be at the present time.

Occasionally, some bold leader tries to start one, as recently during a mayoralty campaign in Baltimore, but he invariably fails. In fact, the generation-old revolt against Gormanism was only a partial success. Under the leadership of Blair Lee, former United States Senator, and others it did fine service for political cleanliness. The methods of Arthur Pue Gorman, for long absolute master of the state's political destinies, were suppressed—in fact, rendered so unfashionable that the most corrupt politician would not attempt to use them in more than rare local cases today. But Gorman's political descendants survived. John Walter Smith, his political heir, has occupied the Gorman throne now for nearly a quarter of a century. But the state Democratic throne is slipping from under Smith. He is now an old man, verging upon eighty, and the day has about passed even in Maryland for the Smith type of leader; not that he is a bad man; he merely is of the old school which fiction writers a decade or two ago were fond of glorifying.

Smith's power is now overtopped by his old friend and political associate, Frank A. Furst, who is much of an exception and a great deal of a contradiction in American politics.

Furst is of German nativity. Coming to this country a poor boy, he accumulated large wealth in the robust and not always gentle game of contracting. Public contracts have been his specialty and politics his avocation; yet he has never been tinged by scandal. He has refused most of the big offices within the power of the state to bestow, always lends his aid to wholesome social or political movements, and yet has kept in the forefront of the Democratic organization. Now as the result of differences between Smith and Governor Ritchie, Furst finds himself in a position approaching that of state boss. And he, like Smith, now verges upon his eightieth year.

Smith's decline, Furst's ascendancy, the natural trend of events, all tend to put Ritchie, the present governor, in more or less supreme charge of the Democratic party in the state. This is foregone provided Ritchie wins re-election which now seems highly probable. He will hold first place probably for a long time, provided he develops more qualities of political finesse than so far has been shown by him.

Anyway, the Fates indicate that Ritchie, if he so wishes, will have all but controlling voice in selecting and defining the course of the state's delegation in the next Democratic convention. And with Ritchie Bernard Baruch of New York may have great influence, as the result of a close friendship and alliance formed when Ritchie was chief counsel for Baruch's War Industries Board. This means, at the present time, that McAdoo has best prospect of corralling Maryland's convention vote.

Topping the Republican structure there is a coterie of the select of wealth, social standing and intellectual prestige. It derives from the Unionist traditions of the Civil War period, and from business realms, particularly those elements of the latter that are animated by modern-day incomers from north of the Mason and Dixon line. It is both diamond-back and mossback in its conservatism. Then comes a moderate middle-class element, made up of immigrant strains, men of the small business type, and ruralites, most numerous in the mountain areas who still are opposing Secession. These, normally not more than one-third of all the white population, are moulded into a party or faction by the lowest strata of the state's social make-up, the Negroes—who still vote for the freedom which Lincoln gave to them.

Thus Maryland Republicanism is peculiarly adapted to close organization control. Just now that control approaches an ownership exercised by three men, two of whom are men of big F Finance. They are W. Bladen Lowndes, a millionaire banker of Baltimore; William P. Jackson, millionaire lumberman of the Eastern Shore, and Ovinton E. Weller, millionaire ex-banker and at present United States Senator. At the present time, whatever they say "goes" in Republican circles much further than the "say" of any single group of Democrats.

Nationally, the Maryland Republican organization is as regular as the moon itself.

Revolt Most Unlikely

THERE is a growing inclination among Marylanders to loosen the bonds which have tied them securely to the old parties. A smaller proportion of the voters is declaring party fealty when registering—and a dwindling proportion, it would seem, is taking the trouble to qualify at all for the ballot. There probably is more indifferentism than independency, for the bulk of the people of this state can still be depended on, when in the ballot box, to choose between the tickets offered by the two old party organizations. But enough do exercise a degree of choice to keep those organizations from becoming utterly lethargic, or demoralized by factionalism.

For anything like true political revolt, no state in the union offers less fertile soil. Many things account for this—tradition, a large Negro population, and above all the easy living which smiling Nature generally makes possible here.

All these combine to make of politics more of an intellectual exercise than a means for curing all the ills of mankind.

The game here thus attracts much of the cream of the state's best intellect and prestige, with the result—barring the local instance—that it is played on a plane perhaps a little higher than in the average Eastern or Southern state. On the whole it is played in a cleanly way. The grosser forms of corruption are not countenanced as in the days of Gorman, though political "spending" is probably as quantitative as ever before. It is estimated that not less than $100,000 was spent for advertising in a recent mayoralty campaign in Baltimore.

Race-track interests have been suspected of increasing the per capita circulation at the state capital during legislative sessions, and the "wets" no doubt followed the golden policy here which brought havoc upon their heads elsewhere.

But, as a whole, government in Maryland is clean. Only recently the chairman of the State Democratic Committee was removed from public office by the Democratic governor for an indiscretion that critics could color with the hues of opponent corruption.

And despite the millions that have been expended on the country's best state system of public highways and on other state enterprises, Maryland, alone among the Union's commonwealths, lately has reduced its tax rate.

From Twenty-five Cents to 200,000 Circulation

IT TOOK Robert S. Abbott sixteen crowded years to do it. But today, as editor and publisher of the Chicago *Defender,* a weekly devoted to the interests of colored folks, he stands at the head of the only institution of its kind in the world. There are other Negro newspapers and magazines, scores of them, but this is the only one which has its own plant, equipped to the smallest detail of operation, and unbacked by any form of subsidy.

Literally, Mr. Abbott started his venture with twenty-five cents, a writing pad and a pencil. Nobody knows how he got funds for that first edition back in 1905—even he has forgotten. But the little folder appeared—a four-page pygmy, sixteen by twenty-four inches with one or two small "ads." The whole edition cost less than fifteen dollars.

For five almost disheartening years he struggled before he could attain a circulation of 5,000 a week. During this time he was printer, reporter, newsboy, editor and owner. Now he has cut down this evidence of versatility; he remains only editor and owner. He would take for his "ads" what he could get; sometimes a page might go for ten dollars. But he held on, waiting for the break that he felt sure must come. Thus, he sums his success in the apothegm, "I laid out a course and followed it."

Mr. Abbott attributes the unrivalled growth of his paper to certain definite factors of particular appeal to the race group which he set out to serve. The paper has never resorted to mud-slinging in the defense of or opposition to any cause. It has been constructive in policy and aggressive in tone. It heard the cry of the colored people of the South and voiced a clarion note of social and economic justice hitherto unuttered by any of the more conservative papers. And yet the man behind it always maintained the creed of a sanist, and orderly progressive, seeking to better things within lawful and legitimate channels.

From the beginning the paper catered to the colored people of the rural South. Thus the *Defender* grew through filling a long-felt want. The editorials, for instance, were essays of "advice" as to how to meet certain situations rather than paragraphs of logical argument.

Another distinguishing feature of this paper was that it ferreted out through an "underground" system both sides to all news items that were not otherwise related in detail. This "news" was reported as truth, but was not played up as sensation. These chiefly are the things that have made the *Defender* come second only to the Bible as the gospel of the written word in many of the obscure sections of the South.

Pullman porters and dining-car waiters aided the growth of the paper by taking a dozen or so copies and leaving them at small towns. In such instances it is computed that a single copy would be passed along until read by ten or fifteen persons.

In physical appearance the paper looks like any big daily. It runs its stream-headline in red, uses double column layouts on features, has fresh new type, pyramided "ads."

The founder is a product of Hampton Institute, whence hails Major Moton, President of Tuskegee Institute. He is a graduate of Kent College of Law, Chicago, though his interests have been confined to journalism. He was appointed by former Governor Lowden as a member of the Illinois Race Commission following the Chicago riots and he is director of the Binga State Bank, the largest institution of its kind in the North.

The Tale of the Five Milk Fairies

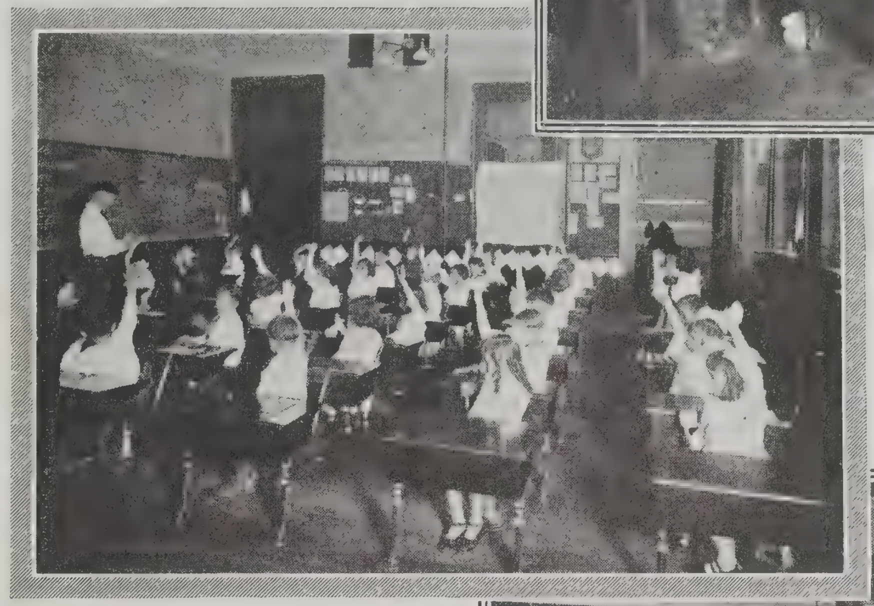
Imaginary Characters Employed to Build Interest in School Lessons

By S. R. WINTERS

SALLY SUGAR, Fannie Fat, Patrick Protein, Minnie Mineral, and Viola Vitamines, like Mark Twain's Huck Finn, Peck's Bad Boy, Dickens' Oliver Twist, and other famed imaginary characters in fiction, are likely to become as firmly fixed in the minds of youth as though they actually existed in the flesh. These five queer though fascinating names, having their origin in fairyland, were conceived as a means of impressing upon children throughout the United States the value of milk. This system of nomenclature represents the body-building constituents in milk—sugar, fats, proteins, mineral matter, and vitamines.

School children—say from six to twelve years old—when told about proteins and vitamines as such receive no definite impressions. However, when these food constituents are "sugar-coated" and introduced as characters of fairyland, boys and girls visualize the names and what they represent. Thus, Patrick Protein and Viola Vitamines, though they live in fairyland, become real characters in the lives of youthful boys and girls whose readiness in acquiring knowledge is largely determined by arousing their interest in the particular subject. Moreover, disguised in terms of "playmates," these once seemingly foreign subjects are no longer strangers to youth.

Milk campaign—Speaker's Training School, posed by a group of workers in the Dairy Division of the United States Department of Agriculture. Miss Jessie M. Hoover is conducting this school.



Taking the daily order for milk.

The Dairy Division of the United States Department of Agriculture, in recognition of the principle that the education of children contemplates the arousing of their interest, is arresting the attention of boys and girls to the value of an adequate consumption of milk by invading fairyland. Instead of admonishing youth to drink more milk lest undernourishment become a prevalent condition, Miss Jessie M. Hoover, milk utilization specialist of the Dairy Division, tells the story, by text and illustration, through the captivating "milk fairies." Children, both in the city and countryside, are frequently unwilling to drink milk in sufficient volume to insure growth and sustain physical well-being. The mother, who would disdain the practice of scolding the child because of a failure to drink milk in abundance, can adopt the story of the "milk fairies" as a pleasing method of persuading the boy or girl to drink plenty of the vital fluid.

If the child is old enough to carve a large milk bottle from cardboard, which should stand alone, then the task is performed in absence of assistance from mother. Otherwise, the parent fashions the cardboard milk bottle for the child. The make-believe bottle for containing the product of the cow should be nine or ten inches in length and when not in use may be retained in a large manila manuscript envelope. The milk bottle having been sketched and cut into shape, the mother of the child should obtain five paper dolls, enough smaller in dimensions to be temporarily fastened (a convenient method is to use paper clips) on the milk bottle as the story of the "milk fairies" is related. These dolls may be fashioned from old magazines, sketched outright, or purchased from stores. One of the popular kewpie or similar series of manufactured dolls are appropriate for this purpose.

The five dolls should be dressed in different colors, thus making for easy identity by small children and lending colorful interest to the imaginary beings from fairyland. The "milk fairies" of the Dairy Division are garbed according to the following method: Sally Sugar, white; Fannie Fat, yellow; Patrick Protein, red; Minnie Mineral, green; and Viola Vitamines, lavender. Paper dolls fashioned from magazines by the nimble fingers of children create additional interest in the story of "milk fairies" and the object lesson being taught is more impressive. Then, too, the children gleefully perform the task of coloring the doll dresses in varying hues—employing paint or crayon, or possibly paste varying colors of tissue paper on the characters from fairyland. The mother of the children may tell the story of the "milk fairies" in her own words, or the tale suggested by Miss Hoover of the Dairy Division may be appropriately followed, vivid as it is. Here is the story-talk:

"These are the milk fairies, who live in every bottle of milk, and help boys and girls when they drink the milk. *Sally Sugar* is the first fairy. She is just as sweet as she looks, and she has a playmate named *Fannie Fat*. These two like to do somewhat the same things for children.

"I wonder who knows why people put coal in the stove?"

Children:

"To keep warm and to have heat."

"And why do they put coal in the steam engine?"

Children:

"To make it go."

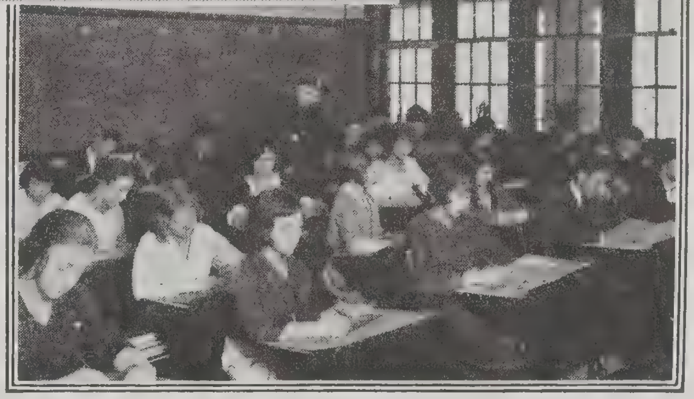
"Well, Sally Sugar and Fannie Fat do just these things for our bodies. They give us heat and make us go, so that we can play and work.

"Now, here is the third fairy who lives in the milk. His name is *Patrick Protein*. That's a hard last name, isn't it? But some people have names that are hard to say. He helps us build strong muscles.

"*Minnie Mineral* is a building fairy, too, but her work is to build bones and teeth. Children that don't drink enough milk have soft bones and often poor teeth. Hard teeth and bones we all need for our daily work and play.

"The last fairy is a very important one. Her name is *Viola Vitamines*. She makes children grow big and keeps them well and strong. She likes to live in the cream, so children must always have plenty of good creamy milk if they want to grow big and strong and well, and if they want all the other fairies to help them as much as they can.

"Milk is the only food that has five fairies. If the children drink only half as much milk as they should, the fairies cannot help them very much. Some foods have only one or two fairies; and some have none at all. Children who are allowed to drink tea and coffee instead of milk do not have much help from the milk fairies, do they?"



Richmond, Virginia, milk campaign. School children working on milk posters.

"Drink Milk for Health Week," a slogan that has echoed and re-echoed for the past two years in sixty towns and counties throughout the United States by the Dairy Division in its concerted effort to stimulate the consumption of milk, has revolved around school children. The story of Sally Sugar, Fannie Fat, Patrick Protein, Minnie Mineral, and Viola Vitamines, has been told and retold until these must live in the minds of thousands of boys and girls throughout America. It is interesting to contemplate the contribution that the tale of the "milk fairies" made in increasing the use of milk in 1921 to forty-nine gallons for every man, woman and child—a consumption hitherto unapproached. Schools, city and urban, were the nucleus around which six-day or two-week demonstrations were conducted by the Dairy Division and co-operating agencies. The characters from fairyland were described in each instance.

That there is a vital relation between undernourishment among the children in both city and urban schools and the failure to drink an adequate supply of milk has been repeatedly demonstrated by surveys conducted by the Dairy Division. The value of the symbolic characters of Sally Sugar, Fannie Fat, Patrick Protein, Minnie Mineral, and Viola Vitamines, in correcting this unwholesome condition is evidenced by a letter written by a Southern boy on the subject, "What the Five Fairies are Doing for Me":

"They are making me feel a lot better and when I first started to use them I weighed only 110 pounds and I was five feet high. Now, I weigh 115 pounds. I can study my lessons a lot better, and I learn them easier."

Constant Tinkering With Our Money System

Concluded from page 8

should not be held to preclude the establishment of an international bimetalic money standard if and whenever circumstances warranted. This is a point our gold standard friends are invited to consider in their discussion of "cheap" money.

Did this "perfection of the national monetary" system prove disappointing? Rather. For there was immediate agitation for *another revision,* which came to a focus in the "Bankers' Panic" of 1907, a panic which is a chapter of criminal crushing of rival interests by the United States Steel Corporation which stains the record of a Government created to protect the weak against the strong.

That destructive panic led to the creation of the National Monetary Commission through an Act of Congress approved May 30, 1908. The reader will note that the Act of 1900 was sponsored by an independent organization, while the new commission was an official body.

The President appointed the following members: Senator Aldrich, chairman; Senator Vreeland, vice-chairman; Senators Burrows, Hale, Money, Burton, Bailey; Secretary of State Knox; Representatives Weeks, Smith, Padgett, and Pujo. Civilian members were Henry M. Teller, Robert W. Bonynge; Arthur B. Shelton was secretary, and Professor Andrew, adviser of the commission.

In January, 1911, Senator Aldrich introduced to the commission an outline of a plan for revising the monetary system of the country, and in May before the trust-company section of the American Bankers' Association explained at considerable length the details of the plan, and answered various objections to the creation of a Federal Reserve Association, its most conspicuous feature. Widespread criticism caused Senator Aldrich to make some changes, and in December the amended plan was laid before Congress.

The reader will remember that the Aldrich-Vreeland proposal was not made a law. Although the strongest pressure was brought to bear on Congress, there remained members of the majority who combined with the minority to defeat the measure.

That two years later the then minority having become the majority through the defeat of Taft was induced to pass an act just as satisfactory to the money monarchs is one of the remarkable accomplishments in American history. This narrative may well close at this point, since the history of the origin and establishment of the Federal Reserve System is worthy a chapter by itself. Suffice it that amendment has been deemed necessary, even in this greatest and most perfect product of Expert Experimentation, and, as noted at the start, *another revision is now on foot.*

All of which goes to prove the thesis that being a banker does not necessarily imply infallibility in the science of money.

Changed Viewpoint on Export Trade Needed

Steadiness, Survey of Markets and Long Credits Three Prime Factors

By WILLIAM KNIGHT

IN SPITE of the fact that about ninety per cent of our export trade is absorbed by European markets, and in spite of the fact that we need to export quite a large percentage of our manufactured products if we wish to keep alive all of our manufacturing plants that have grown out of the abnormal demand for American goods during and after the war, we are strangely inclined to look upon our foreign trade as only an emergency outlet for our production during such times when business is slack at home.

In England, in Germany, in France, the export trade has always been an art and a profession, while in America it has always been a more or less amateurish performance—something to fall back to in slack times.

All this reminds me of an incident that occurred in Italy during one of the visits that the former German kaiser paid to that country. It had been arranged on that occasion that the kaiser should attend an exposition of industrial products taking place in Venice. The visit to the exposition took place as scheduled. It happened that the kaiser became particularly interested in a booth exhibiting colors and dyes. It also happened that in handling a bottle containing some sort of coloring matter, part of its contents was spilled, thus staining his imperial hands. Handkerchiefs were produced by some members of the party, soap, water and towels were immediately brought and were offered to the august visitor with profuse apologies for the regrettable incident.

Good and Bad Salesmanship

THE color, however, was impervious to the cleansing action of the soap, in spite of the industrious efforts of his majesty to wash it off his hands. The situation was becoming rather embarrassing when somebody in the party produced a piece of soap "made in Germany" and offered it to him to try, at the same time explaining that this new brand of German soap was guaranteed to wash out any stain without injuring either the skin or the fabric, and so forth. The kaiser, who had already proved to his own as well as to everyone else's satisfaction that Italian soap was no good, graciously consented to try the German soap and, sure enough, it did the trick. He was so intensely interested in the experiment that he wanted to try it on a handkerchief stained successively with several fast colors. In every case the piece of soap "made in Germany" proved that every claim of the manufacturer as to its properties was true and correct. On the next day every newspaper in Italy contained this story in which the incident that had occurred at the Venice exposition was reported in every detail. On the very same day an army of German salesmen flooded the Italian market with that particular brand of German soap which had been so efficiently advertised by the kaiser himself.

The soreheads claimed that the kaiser had put over a thing which was not exactly square or proper. Some newspapers had the nerve to publish editorials that followed the same line of thought of the soreheads. Somebody referred to those editorials as anti-German propaganda. The Italian soap manufacturers, however, called the whole business a fine piece of free advertising for the soap "made in Germany" and for quite a long time cursed both the German kaiser and the Italian press.

You must give credit to the Germans for being good salesmen. Their greatest asset, I believe, is their ability to look upon any situation from the point of view of the man to whom they are selling. The German understanding of local conditions and requirements of the public that a merchant must meet to sell his products makes of the German salesman an ally of the local business men. He never tries to force the latter into the position of an unwilling pupil of better business methods that an American salesman is always ready to jam into the head of a prospective customer.

Before the war I pointed out to a friend of mine in Italy, who used to import from Germany a considerable amount of dry goods, that in a good many cases he would have saved money or would have obtained better goods for the same price if, instead of buying in Germany he had bought in the United States. His answer was: "You may be right. The trouble, however, with you fellows is that you do not seem to be able or to be willing to understand our problems, and, furthermore, it seems to me, you are not anxious to do business with us. I have been trying for one year to impress upon the representative of an American shirt manufacturer with whom I have tried to do business that I did not want men's shirts which are open in front, all of the way down. I have also tried to make him see that the type of trousers that we wear here in Italy does not stop at the hip, as American-made trousers do, but they carry a belt which reaches almost four inches above the hip. The type of underwear that we use here is not the one-piece union suit used in America. We use a two-piece garment and for this reason we must have attached to every man's shirt a flap located at the right height on the shirt front to allow the shirt to be buttoned to the undergarment. Do you think that I have been able to obtain what I wanted? Not on your life! That fellow insisted on proving to me that a shirt which is not open in front all of the way down is very inconvenient to slip on and off, that trousers with high belts were uncomfortable to wear and that to button the front of one's shirt to his underwear is an idiotic thing to do anyway. It took a great deal of my time and patience to explain to that man in his own language, because he did not speak a word of Italian, that I intended to sell shirts right here in Italy and not in America and that therefore I had to satisfy the requirements of my own trade and that I did not dare to try to Americanize my customers and to force upon them a style of shirt that they did not care for. Finally, after I succeeded in educating him to look upon the whole matter from my own point of view, do you think that he succeeded in educating his home office? Do you think that he succeeded in obtaining for me what I had ordered? Not at all. They persisted in shipping over here shirts that I could not sell, in spite of the frantic efforts of their own local representative to awaken them to the realization of the fact that I was the one who had to sell their shirts, and not their foreign sales manager who did not care a whit for my problems."

And there you are. This is typical, and not by any means an isolated case, of poor American salesmanship abroad. Of course, cases of this sort do not prove that American business men lack the ability to care properly for their export trade. They simply prove that they are not sufficiently interested in the export business to take the trouble to establish well-organized foreign trade departments which will make a study of the conditions prevailing in each country and will do whatever is needed to build up permanent markets for their products, wherever they can be profitably established.

Permanent markets for a good many American products can be profitably established in practically every country in Europe, if we make up our minds that we want them and if we decide to take them seriously as a permanent source of income and not as dumping grounds for our excess production in times when business is slack at home. So far, we have been generally inclined to take a fling now and then at foreign trade, and as a consequence of this wrong way of looking at export trade, those who went to it only half cocked succeeded only in burning their fingers.

A big importer of macaroni and Italian cheese in France, immediately after the war, found that it cost more to buy these products in Italy than to import them from the United States. Consequently, he started buying here and was highly satisfied for awhile, until he discovered that his American friends were no longer eager to supply his demand. Furthermore, the fluctuation of the exchange became so erratic, the shipments so irregular and the packing of the merchandise so careless, that he could never figure out whether, by the time he received the goods, he would make or lose money on each shipment. I put it in the words of this particular importer whose view was endorsed by scores of other importers of American products with whom I talked. It is:

The Importance of Details

"HOW can you buy American products on a dollar basis if you can never know what is going to happen to the value of the dollar between the time that you buy the merchandise and the time that you sell it. Of course, we cannot blame American exporters for the oscillations of the exchange; *'c'est la guerre.'* But if you fellows cannot devise some means whereby your products can be made immediately available here when we need them, without waiting weeks and months before they arrive from the other side, I am afraid we cannot do business with you. Also, you must keep in mind that if we ask you to comply with some particular requirements regarding the packing of your goods, we have always some very good reason for insisting upon these requirements, which may look foolish to you while they are a matter of serious concern to us. Take, for instance, the packing of macaroni in ten or twenty pound boxes, which is a perfectly normal thing in America. Here in France, we have always bought macaroni from Italy in five and ten kilogram boxes and we must sell it in kilograms. The public asks for Italian macaroni and we cannot tell them that we buy Italian macaroni in Brooklyn, New York, where they use the British system of measures, and that this is the reason a box of macaroni weighs four and five-tenths kilograms and nine kilograms instead of five and ten."

"Also, for ages the Italian macaroni has been packed in boxes and packages of all sizes, wrapped in a stiff blue paper, while French macaroni, which sells at a cheaper price, has always been wrapped in white paper packings. To your people in Brooklyn, the color of the paper means less than nothing. To me, the color of the paper makes a whole lot of difference, because I am the one who has to sell your products to a French public that asks for Italian macaroni and expects to receive it with all the earmarks of the true article even if it is an imitation."

Here again we find the same trouble—the same old tendency to force over the American idea of doing things instead of trying to meet local customs that cannot be suddenly changed. Here again we find that Germany beats any other nation in the export game on account of her ability readily to adapt her foreign trade to the local demand.

This reminds me that immediately after the war all sorts of cheap toys ridiculing the German kaiser made their appearance in Paris. A large supply of German war crosses, German helmets and all sorts of war souvenirs, supposedly picked up in German trenches, could be obtained in almost every store in Paris or in any other city in France. Postal cards and cartoons extolling the heroic French and Allied soldiers and ridiculing the poor German soldier, who was always represented as a runaway coward, could be bought almost anywhere in France. While this was happening in France, the same articles made their appearance in England and in Italy, and inside of a month a veritable flood of these articles had invaded every store in the Allied countries. The thing looked suspicious, especially since every article had every appearance of having been "made in Germany." An investigation was made in France and it developed that the very same day when the Armistice was signed, cheap toys ridiculing the kaiser, postal cards, cartoons, German helmets and German war crosses had been shipped by carloads from Germany into France, England and Italy, via Switzerland. Quite evidently they had been prepared in advance.

I have since spoken to the owner of a large printing business in Germany who presented me with two complete sets of postal cards printed by him for the emergency of the Armistice. One set was for home consumption and the other for external consumption in the Allied countries. He admitted that he had made quite a good profit in that transaction and furthermore he considered it as good business and a great joke on his colleagues in France, England and Italy. The ethics involved in the transaction did not bother him in the least; as a matter of fact, I do not believe that he could see anything wrong in the matter.

The Matter of Credit

EVERYBODY knows and is ready to admit that it was not easy, before the war, to beat the Germans in the export business. Cheap products and cheap German labor were blamed for that, and, to a certain extent, the point was well taken. However, the true secret of the German success in the export business was their credit system and their extreme care for details. These are the two points on which they could not be beaten and these are the two main points in which America fails in her foreign trade. We are accustomed to do business here C.O.D., or on the basis of thirty, sixty, and ninety days' credit. This will never do in Europe, where they are accustomed to longer credit. Before the war, Italy was one of the strongholds of the German export trade and at that time Italy was full of German banks. Wherever a German salesman went to sell his merchandise there was always a bank controlled by German capital that was ready to discount the notes taken by the German salesman. In most cases, if you wanted to do business with German firms and receive the benefit of long credit, you had to bring your account to some particular bank that would take care of you. It is not surprising that in more than forty years of a peaceful, but forceful, commercial penetration of this sort, when the war broke out in 1914, Italy, commercially speaking, was nothing but a German colony.

Long credits and an intelligent survey of the particular needs of each customer are the true secrets of success in the export trade. In both of these points we have failed so far. Very few American banks are now doing business in Europe and if we want to go into the foreign trade we must have a good network of American banks over there. As a matter of fact, the American banker must do the pioneering work for the American exporter and the American salesman must follow up. The second and very important point that we must keep in mind is this: We must learn how to take care of the details which are brought to the attention of the home office by the local representative. A foreign sales manager who is located several thousand miles distant from the fields where his representatives are operating must be able to rely on the judgment of such representatives, and, furthermore, he must comply with their requests and recommendations. If a local representative of a certain firm wires to the home office recommending that a particular shipment of goods be canceled, he bases his recommendations upon the knowledge of facts which are unknown to the firm. Even if the shipment is protected by a regular contract and everything is ready to be shipped, it pays better to follow the recommendation of the man in the field than to follow the snap judgment of a foreign sales manager based on the wording of a contract. I could mention several cases in which the Napoleonic tactics of some American foreign sales managers, who would not follow the advices of their foreign representatives in Europe and suspend the shipment of merchandise at some particular moment when the exchange value of the dollar was performing some spectacular and acrobatic jumps, have cost a great deal of money to the firms for which they were working.

As I said before, we cannot take flings at foreign trade—we must play the game according to the rules and we must play a steady game, paying the utmost attention to details, if we want to make money. Otherwise, we might as well keep away from foreign markets. We must remember that the matter of granting long credits to our customers in Europe who have been accustomed for a long time to do business on a long credit basis is a most essential point, which should attract the attention of American bankers before we can fully develop our export business. We want a powerful merchant marine. Everybody agrees that our merchant marine should be second to none. But how can we have or even expect to have a powerful merchant marine if we do not become an exporting nation like England?

With Germany out of the way for a number of years to come and with a tremendous demand for all sorts of manufactured products all over Europe, we have now an exceptional opportunity to become the first mercantile nation in the world. We have the raw materials and the man power. We have the manufacturing facilities and the organizing ability. We have a powerful fleet of merchant ships to carry American products all over the globe. Why do we not plunge into the export business and capitalize the opportunities that are offered to us by European markets?

Twenty-two Years Devoted to Clean Athletics Builds Philosophy for Yost

"Play the Game Hard, But Play It Fairly," Cardinal Principle Great Coach Instills

By MRS. L. M. CRAMER

TWENTY-TWO years ago this autumn Fielding H. Yost, Director of Athletics at the University of Michigan, came to the school as its head football coach. Today, from coast to coast, and from Canada to the Gulf states, more people know who is coach of football at Michigan than know who is president of the institution. Wherever clean football is known, there also Yost is known. He has done more, perhaps, than any other man to elevate the game and make it in reality a great game, to be played by strong, quick-thinking, clean, virile young manhood. "Play the game hard, but play fairly," is the cardinal principle which Yost instills into his teams, and much of his success as a coach is due to strict adherence to this principle.

A homely and wholesome philosophy of life is Coach Yost's. Rules of life and rules of the game have much in common—for life is the greatest of all games, he declares, and needs much the same observance of certain rules as does football. "A man who plays football intelligently and correctly leaves college better fitted for the battle of life," maintained the coach. "In reality the same principles and axioms of conduct guide both games, and having learned and played a clean game of football, a youth can more easily and more successfully face life's problems. There are instilled into him certain principles, ideals and methods that help him immensely."

Life and Game Rules Same

IN HIS soft voice, with its southern drawl—so incongruous with the nickname "Hurry Up" which sport writers at Michigan gave him nearly a quarter of a century ago—Mr. Yost discussed the rules of life and football.

"Both games are governed by certain boundary lines and rules. Loyalty is one of the greatest assets a man can bring to either game—loyalty to a purpose, to a university, to a friend.

"In life, as on the football field, one must learn to face opposition without flinching, even if the opposition seems stronger than he can resist. Athletes must summon up determination, will power, grit, courage and persistence to overcome any obstacles that may be in their way. Football men are battered in every game; they are not good players who do not come up more determined than ever. So it is in life.

"On the football field and in life, one should endeavor to make his distance and never be held for downs. Once stopped, however, he should not be discouraged, but come back with greater determination than ever before.

"When the game is going against him a real football player keeps his head up, sets his jaws and digs in all the harder. This is what tests the stuff he is made of. So it is in life.

"One cannot win the game on his own side of the scrimmage line. He must be aggressive and carry the fight to the enemy.

"Above All—Play Fairly"

"NO GAME can be won today on what was done last week. Every contest demands the best efforts of every player. Over-confidence has no place in football or in life. Too many games have been lost that way.

"A football player or a player in the game of life should never shirk his preliminary work. It is here that he gets the training which will enable him to make accurate decisions and to act upon them instantly.

"Not how little but how much one can give should govern him in whatever he undertakes. There is no place on the eleven for a man who is giving the least he can. The man who puts the most into the game will get the most out of it. This is equally true of life.

"The successful football player must have initiative. He cannot always rely on someone else to think for him, but must work out his own problems.

"One must be self-confident without being over-confident. One must be ready to meet his opponent evenly without giving ground.

"Mental poise is essential. A quick temper may result in ejection from the game or a penalty that will lose the contest.

"An opponent should always be treated with respect.

"Above all, one must play the game fairly. He must make no foul tackles. The man who is doing the right and manly thing can put much more into his game and can stick longer. When this man wins he will have a clean conscience. He will know that he has done the fair thing and if he loses he will know that he has done the best he could and has done it in a clean, manly way."

Coach Decries Betting

LEADERS in the field of physical education and athletics in this country all have come to realize the value of ethical standards in sport. As a result, American athletics today are conducted on a far higher plane than ever before. Among those who have strived for this ideal, none has worked harder to bring it about than Coach Yost. In spite of this great progress, however, some practices still prevail which very naturally detract from the full value of college athletics; particularly is this true of betting on the contests. Coach Yost considers that it has become a menace to the progress of sport's greater ideals.

"Betting throws around college athletics an atmosphere entirely foreign to the true spirit embodied in games," said Coach Yost. "Fundamentally, all college athletics are based on the principle of play for play's sake. The theory of every game is to gain a given goal by overcoming whatever obstacles present themselves. In life we encounter natural obstacles. In games we encounter artificial obstacles placed there for the purpose of making the game more interesting. The greater and more difficult the obstacles, the more intricate becomes the game, and the more intricate the game, the greater the interest in playing it and the greater the satisfaction in winning. To overcome these obstacles for the sake of the satisfaction that comes with success is the ideal embodied in all games. To a greater or less degree, depending upon the extent and nature of the practice, betting commercializes this ideal and to that extent robs it of much of its keenest thrill and satisfaction.

"More practically, however, the practice of betting interferes with the progress of college athletics by stimulating ill feeling and destructive criticism on the part of those who bet. Most students, alumni or townspeople who bet on their team have some vague idea that by so doing they are demonstrating their loyalty. As a matter of fact, they are in nearly every case sowing the seed of actual disloyalty. The time when a team needs and appreciates support is when it is losing, and then is the time when the one who bets usually forgets all about loyalty.

Lose Sight of Ideals

"STUDENTS especially have no business betting on games. Usually they are not betting their own money, and if they are, they can seldom afford to do so. It is only human nature to blame some one else for their hard luck, and before they know it, they are finding all sorts of fault with the team, the coaches and everybody from the water boy up to the president. All this because they lost a few dollars which they had no business betting.

"Furthermore, when players know that large sums of money are at stake, they are apt to lose sight of the greater ideals for which they are playing. The gain or loss that some personal friend might suffer temporarily overshadows, in the player's mind, the true spirit of the game. He forgets that he is the representative of a great university, of its students, alumni, and friends. He forgets all the traditions that are behind him and all the generations that are before. He forgets that he is playing the game for its own sake and for all that it will mean to the spirit, morale and unanimity of his university.

As a result, his game suffers. Just as all the great battles of history have been fought and won by soldiers who embodied great ideals, so all great athletic contests have been fought and won by athletes who idealized their play. To substitute mercenary incentives for ideals detracts from the keenness of the contestants—it can't do otherwise. Commercializing athletics detracts from the spirit of play, and it breeds criticism, disloyalty and a lack of harmony among the various forces that go to make up a university."

Edgar Guest, Michigan's well-beloved poet, a warm admirer of Coach Yost, wrote a little poem about Michigan's veteran coach, and it is doubtful if anything has been said of the Michigan mentor which pleased or touched him more.

FIELDING H. YOST

He called the verses, "Coach Yost." They follow:

When he walks across the field
With his courage as a shield,
Very little is revealed
Of the man.
That cigar stuck in his phiz,
And that long gray coat of his,
Do not tell you what he is,
Or his plan.

Not the thousands sitting near,
Quick to praise and quick to jeer,
Asking victories year by year,
Understand.
For the multitude that shrieks
Never hears him when he speaks
To the boys who through the weeks
Form his band.

For there are few to hear him when
He is saying: "Boys, be men!"
Few to hear his counsel then
In the room.
Few to hear his: "In the name
Of high heaven, lads, be game!"
Few to see his courage flame
Through the gloom.

Though his manner may be droll,
He sees more than just the goal;
There's a boy who has a soul,
And he knows
By the honor of his play
And the things which he may say
He shall shape that soul some day
As it grows.

By the rules and by the right,
By an honest use of might,
He would teach that boy to fight
To the last:
And when failure hits his clan,
He says: "Meet it best you can!
This makes every boy a man,
When it's past!"

So I write these few lines down
To Coach Yost and his renown,
And I'm handing him a crown
For his brow.
A poor crown without a gem,
Not a dazzling diadem,
But a lasting letter "M,"
Here and now.

It was not my joy to be
Coached by one so fine as he;
Out of school life summoned me
To my post.
But I hope when comes the day
For my boy to go away,
I can send him out and say:
"Follow Yost!"

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

The "Guide Trust" at the Capitol in Washington, D. C., is to be broken up. This system allowed a coterie of a few men to charge practically an "admission fee" to the American people for the privilege of seeing their own National Capitol. The Federal Government will operate a guide system free of charge.

Widows of Presidents who die in office receive the salary which their husbands would have drawn for the remainder of the salary year.

A bottle cast into the sea at Waikiki Beach, Honolulu, January 1, 1909, recently washed ashore at Hueneme, Ventura County, California. In the tightly sealed bottle was found a note signed by an Iowa man in which he asks to be notified, so that the movement of the tides of the Pacific Ocean, as indicated by the bottle's journey, may be made the basis of data for the American Society of Aquatic Research.

John Stout, ninety-six years old, an Indian scout for General Custer at the time of the Custer Massacre, died recently in Delaware, Oklahoma. He escaped massacre by hiding in the carcass of a dead buffalo.

Missouri ranks first in the amount of cotton grown per acre, with an average of 325 pounds. The figure next nearest is an average of 264 pounds in North Carolina. Then comes California with an average of 258 pounds to the acre. More than 8,000 people moved into Southeast Missouri last autumn from the South to raise cotton, as it is north of the boll weevil line.

During June and July, 1920, there were about 150 cases of typhoid fever in Pittsburgh, California. This was due to a lack of a stock of liquid chlorin. The water supply from the Sacramento River was pumped into the mains for at least one day without being sterilized, and an epidemic followed. Eighteen typhoid victims pooled their interests and sued the city for damages. They were awarded $32,821, the largest individual amount being $12,500.

In 1871 the Osages were assigned to a reservation in the then Indian Territory. At that time 2,229 enrolled. Oil was discovered on their lands in 1901 and since that time the descendants of those Indians have received more than $140,000,000 in royalties from oil and gas.

A locust cookbook has been issued by the Bureau of Agriculture of the Philippine Islands. To prepare the locusts they are poured alive into boiling water and then spread out on shallow trays to dry. Wings, legs, and tip of body are trimmed off and they are then rinsed in water. Small locusts need not have legs removed, as they are tender. One receipt is as follows: Boil locusts for about ten minutes in sufficient vinegar, salt, and crushed garlic, and when the vinegar dries off fry in lard.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Three hundred thirty-four million cubic feet of timber has been sold by the Forest Service in the Tongass National Forest, Alaska. The stumpage alone is sold, title to the land remaining in the Federal Government. The purchaser has agreed as part of the consideration for the timber to build a pulp-manufacturing plant of not less than 100 tons daily capacity, at the Cascade Creek water power site on Thomas Bay. A complete newsprint pulp plant with a daily capacity of 200 tons will be installed. The timber will be cut on a perpetual supply basis, enough seed trees being left to insure complete natural reproduction.

A woman, eighty-eight years old, has made application to the Department of the Interior to be permitted to homestead a tract of public land in Colorado.

Maidservants from the Antilles were imported by a group of French women. However, they did not prove altogether satisfactory. A quarter of the Negresses made fairly good servants, but were inclined to be restless. Another quarter had to be repatriated. The remainder have fully lived up to the expectations of their employers. Hard-working Czecho-Slovak girls are now drifting into France as servants. They are hard working and know their value which is far above that of the serving girls from Martinique.

A gypsum bed 99.8 per cent pure, extending ten miles inland for a mile along a branch of the Mosse River, midway between Cochrane and James Bay, Ontario, is said to be one of the world's most important. It was but recently discovered. The outcropping can be seen at the river's edge, where the deposit is forty feet thick.

Registrations of motor vehicles in the United States have increased from 3,512,996 in 1916 to 13,002,427 on July 1, 1923.

Lucilla Godoy, a Chilean poet, writing in the *Living Age*, says of President Obregon: "His family life is as modest as it is exemplary. He lives with extreme simplicity, not in the Castle of Chapultepec, but in a residence adjoining it. He is a fine, well-to-do country gentleman, sensibly averse to all ostentation. A revolution has lifted him to the supreme magistracy without affecting the Spartan simplicity of his habits."

The worst typhoon since 1906 recently struck the British Crown Colony of Hongkong, China. The wind attained a velocity of 130 miles an hour, uprooting huge trees and throwing them about like matches. The typhoon lashed the waters of the harbor into a white fury, sinking many ships, including a British submarine. The death toll among the inhabitants was heavy.

Last spring a sick boy, near Vicksburg, Mississippi, prayed to get well so he could see Babe Ruth smash out the ball in an exhibition game in that city. He was unable to attend, however. A neighbor of the boy told Ruth and the ball player drove seven miles out into the country to spend an hour with the sick lad, whose prayer was answered past anything he had ever hoped.

John Knight Shields, former United States Senator, exclaimed in a recent interview regarding the coal settlement: "If this is a fair sample of President Coolidge's adjustment of strikes and labor troubles in the interests of the people of the United States, I hope he will not make any further efforts in that direction."

Residents of Birmingham, Alabama, have an unsolved mystery in the invisible obstacle which prevented a flock of pigeons passing overhead from continuing a straight course. Time after time the birds essayed the passage, but at the particular point swerved and returned to renew the attempt. Whether it was fumes from a stack or a peculiar deflection of the wind from some building, or some other air current is not known.

Despite its labor conflicts and lawless disorders, Barcelona is proceeding with an ambitious building program. Thirty-four apartment houses costing $3,000,000 will contain, besides shops, between seven and eight hundred modern apartments, with freight and passenger elevators, and all modern conveniences.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

Nailing a Lie!

Our Dirty Step

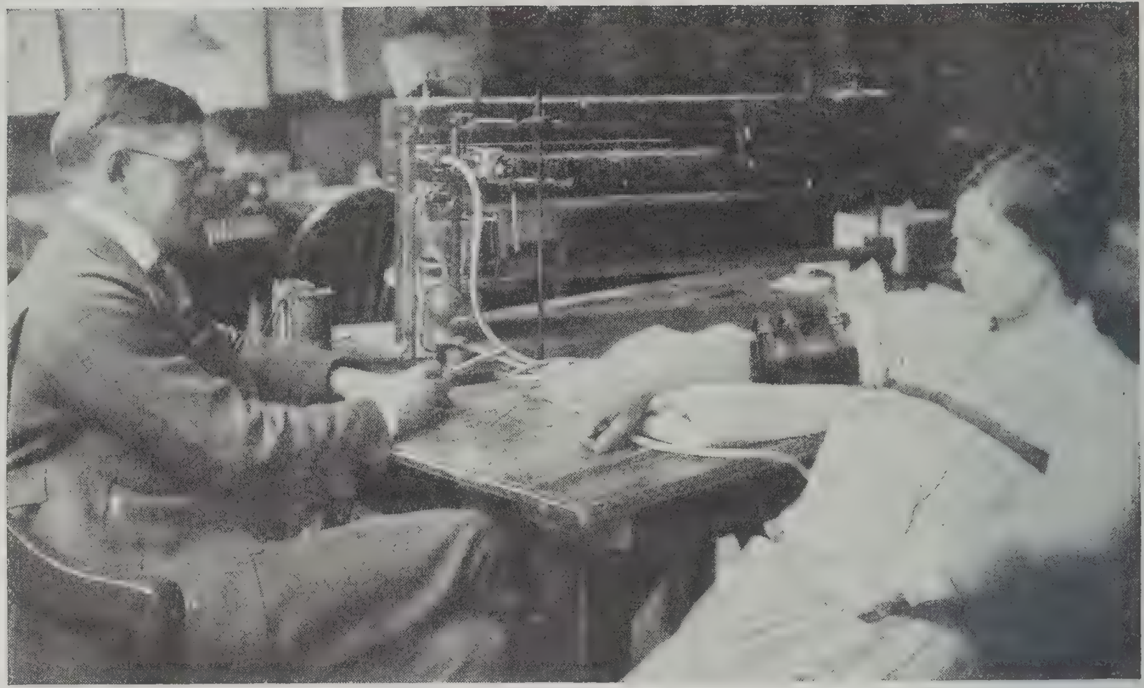
CHRONICLER OF THE NEGLECTED TRUTH

How a Lie Registers on the Heartbeat

The Degrees of Truth

NOT to be honest, not to tell the truth; and to lie are two very different things; the latter is positive, the former negative. The dishonest person does not tell the truth; the liar tells the untruth. It is dishonest to suppress a portion of the truth, to lead others into mistakes, to fail to justify appearances, and to make false use of appearances.

The dishonest person may not have said a single untrue word, and still have introduced many more difficulties, confusions and deceptions than the liar. He is, for this reason, more dangerous than the liar. Furthermore, because his conduct is more difficult to uncover, and because he is harder to overcome than the liar, he is more dangerous than the latter.—Hans Gross, J.U.D., Professor of Criminal Law at the University of Graz, Austria, in "Criminal Psychology."



Professor John A. Larson, of the Department of Criminology of the University of California, conducting an interesting test with a young woman student and the "Lie Detector," of which he is the inventor. The young woman, who is of an especially calm and even temperament, was asked whether she was guilty of several entirely supposititious crimes. She replied that she was guilty—though entirely innocent—and in each case the instrument showed that she had not told the truth.

Experiments Declared Successful Will Save Innocent From Prison

By ROBERT MORGAN

CRIMINOLOGISTS declare that at least six per cent of the inmates in our penitentiaries are innocent of the crimes for which they are paying the penalty. Penologists and welfare workers, including those from the churches, both Catholic and Protestant, claim that the percentage is even higher, and that fully half of those innocent of crimes charged to them are likewise ignorant even of the occurrence of these crimes, or of the identity of the persons who actually did commit them. Some of the criminologists, and virtually all these welfare workers, assert, further, that at least ten men out of every hundred whom we send to our prisons are not criminally minded when they go there, but are made so by the influence of their associates within the penitentiary and the impression of the prison walls and prison discipline.

These are matters at whose basic cause lies truth. If we could know the truth of every crime committed—leaving aside all the wide field of motive—we should know who is responsible for each crime, and exactly who should go to prison as punishment, or undergo medical and surgical treatment as cure, for the actions which resulted in the crime. To find this truth a number of men prominent in the world of science, in the more limited world of prisons, and even reformed members of the so-called "criminal world"—whose existence the author, after twenty-five years as a newspaper writer and editor, rather doubts—have been at work for some years. This year their efforts are beginning to show results. Men and women have been proved guilty or innocent by the testimony of these workers in the fields of mechanics, chemistry, psychology, physiology, and even physics, for the laws of all these are called into service in this hunt for the truth.

It is the purpose of the writer to describe some of these methods by which men's minds—often deeply hidden and tightly woven in the knot of circumstance—have been and are being made to reveal the facts, not alone concerning crimes, but concerning matters of interest to the police powers of communities. In the beginning it might be well to consider just what these men of various branches of science are trying to find out. "Truth," says the dictionary, "is conformity to fact or reality; exact accordance with that which is, or has been, or shall be." Every judge, every honest detective, the city editor of every newspaper, knows that this definition is good as far as it goes, but that it does not go far enough. The practical working definition of truth is "fact as the individual sees it." Because you and I look at a color and pronounce it red is no proof that the color is red; it is simply an expression of the fact that your eye and my eye record the same color as red. Send five competent reporters to cover an accident and you will get five widely varying stories of the accident, its cause, its details and its results. Yet each one of these reporters will be telling the exact truth as he knows it, no more and no less.

The reporter tells what to him is the truth, first of all because he is trained to see what happens; second, because his job depends on his accuracy; third, because he is inherently honest or he could not be a reliable reporter; and, fourth, because of professional pride, since he knows that on his work depends the standing of the newspaper which employs him. If men trained by a lifetime of work to find the truth and tell the truth cannot find anything *except what they see as the truth and the facts,* how can it be expected that men and women, either entirely untrained or trained to conceal the truth whenever the truth will hurt them, shall either see or tell the truth, the more especially when their own personal fortunes are involved?

This is the problem which confronted the men of science when they went in pursuit of the truth in an effort to make more perfect the solving of crime mysteries and the punishment of those actually guilty of these crimes. They knew at the outset that, in all probability, the facts concerning many crimes never will be known, but they believed that if the facts concerning any man's connection with the commission of a crime could be known, such knowledge would at least free the innocent from punishment for crimes with which they had no connection. This, then, was what they went after, and what they have succeeded to a remarkable extent in capturing—the facts concerning any action *as far as they are known to the individual under investigation.*

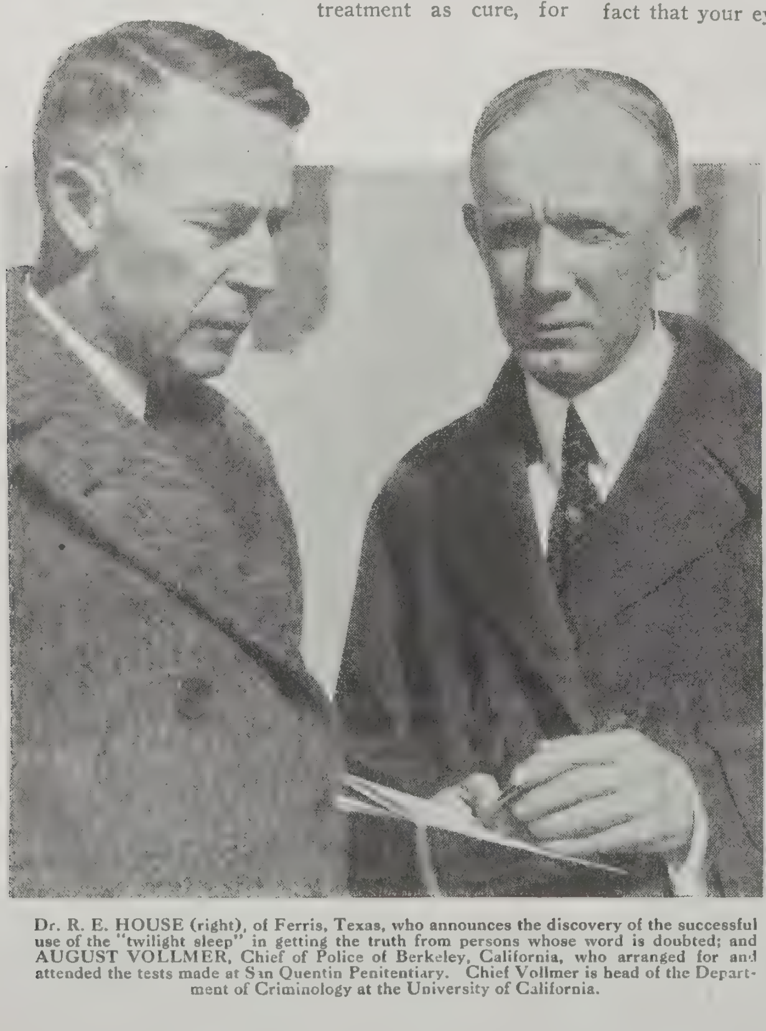
Three men, from rather widely separated sections of the United States, stand out as the leaders in this work. All of them call the laws of physiology, of man's physical structure, into service; one of them uses chemistry as his principal aid, while the other two depend on the applied laws of physics and mechanics. The one who has progressed probably the greatest distance in getting from each person the facts as that person knows them is Professor John A. Larson, of the University of California's department of criminology, and investigator for the police department of Berkeley, California. His work is done with an instrument of his own invention, called the "Lie Detector" for want of a better name, which depends on the quickened pulse and heightened respiration of the individual which comes involuntarily when he tells a lie.

The man who calls in the aid of chemistry is Dr. R. E. House, of Ferris, Texas, who, by the application of scopolamin, produces an analgesic condition, in which the conscious mind ceases to function, the subconscious mind comes to the fore, and the subject is unable to tell anything but the truth as recorded in his subconscious mind. The third man of this triumvirate of searchers after "human truth" is Dr. Albert Schneider, dean of the North Pacific College, at Portland, Oregon. His instrument is his own improvement on the d'Arsonval galvanometer, used in laboratories for fifty years, but which Dr. Schneider is the first to apply to this purpose. It shows, as will be detailed presently, the facts which the subject or suspect is concealing; then questioning brings out these concealed facts. In contrast to the other two methods, this one of Dr. Schneider's depends not so much on getting the truth, or knowing whether a man is lying, but in finding out just what he is concealing.

A great deal that is untrue, and much more that is exaggerated, has been printed about the Lie Detector of Professor Larson, which is doing daily service in the police department at Berkeley for the police departments of all the cities around San Francisco Bay. It is based on thoroughly established physical, physiological and mechanical principles. More than 2,500 tests have been made with it, as many as sixty persons in some instances having been examined before the guilty one—or the one who was not telling the truth as he knew it—was discovered. Of those which the instrument declared to be lying, approximately eighty-five per cent have confirmed the discovery of the machine, the "deus ex machina," if you will, by later confessions, either before or after conviction by juries.

The acting principle of this instrument is based on the fact that under excitement or stimulus of any kind, the human being cannot control the reactions of heartbeats and breathing. An interesting by-product of these tests is that women control these involuntary actions better than men; that is to say, women are better, more persistent and more insistent liars than men, but the factor of sex and all its influences enters here, and a discussion of this phase alone would require many volumes the size of this magazine. The instrument consists of two moving, upright cylinders, around which passes a roll of smoked paper, on which play two needles, the one electrically connected with a chest band which yields or contracts to the slightest change in the respiration, and the other electrically connected with a wristband which is equally attentive to the action of the heart in sending the blood through the veins.

To the man or woman attached to this instrument are asked questions leading up to and including the com-



Dr. R. E. HOUSE (right), of Ferris, Texas, who announces the discovery of the successful use of the "twilight sleep" in getting the truth from persons whose word is doubted; and AUGUST VOLLMER, Chief of Police of Berkeley, California, who arranged for and attended the tests made at San Quentin Penitentiary. Chief Vollmer is head of the Department of Criminology at the University of California.

mission of the crime, connection with which is suspected. The rising and falling pressure of the blood, the heightened and lowered respiration, and the uncontrollable leapings of the heart speak to the Lie Detector in a language it understands, without word of mouth in transmission or necessity for the presence of the human ear in reception. The most accomplished prevaricator, the criminal skilled by years of deception, even the "pathological liar," who is so constituted that he must lie, even when the truth would have better served, cannot escape the revelations of this instrument.

The person subjected to the test is first allowed to sit at rest, with the smoked screen rotating, until a record is obtained of his or her normal respiration and normal heart action. Then the first of a series of questions, ranging from twelve to twenty in number, and leading gradually up to the crime itself, are asked. If the person tested gives a false reply to a question, the moving steel fingers record an increase in the length of the heartbeats, a lifting in the breathing above the normal for the individual—and no matter how clever the man or woman being questioned, he cannot prevent that telltale whisper of the hidden emotions from reaching the smoked screen on the Lie Detector. Likewise, with the innocent person giving truthful replies, the Lie Detector records the truth, its needles traveling evenly across the screen, following the normal lines of the subject's breathing and heart action.

Bear in mind that these tests and this instrument neither show nor pretend to show the abstract Truth. What they do show is whether the subject is telling the truth *as he knows it;* the facts as he participated or did not participate in them. Some of the scientists who have made exhaustive studies of this instrument, its operation and its results, have come to the verge of the belief that all truth is individual; that there is no such thing as abstract truth; but that truth consists, relatively, of the impressions men receive through their five senses, and the accuracy of their individual brains in recording the impressions they have received. This is something to think about, especially in connection with testimony offered in trials as a basis for the imprisonment, even execution, of accused men.

It will be seen from this that the Lie Detector is equally as important in its relations to the witness as to the suspect. If there is a doubt about the truthfulness of the witness, the Lie Detector will set that doubt at rest. Understand, the witness may not be telling the fact as it occurred, but the Lie Detector will reveal whether the witness is telling the facts as he saw, felt, or heard them. That is the important point, and beyond it enters the factor of human fallibility and human error, both in observation and in the mental recording of observations.

An interesting experiment with the Lie Detector was recently carried on as a part of a search for the thief among a group of members of a college sorority on the Pacific Coast. About fifty girls were members of this sorority and residents in the sorority house when the thefts occurred. Any one of them might have been the thief; in fact, it was virtually sure that one of them was the thief. All were asked to submit to the tests of the Lie Detector, and all agreed. One after one they were attached to the instrument and questioned by Dr. Larson, with August Vollmer, chief of police of Berkeley, himself a criminologist of note, watching the results. Only one girl showed variations from the normal heart action and respiration when she was asked the direct question of whether she took the stolen articles.

This girl's reply to this question—as were the replies of all her sorority sisters—was "No," but the Lie Detector picked her from the half-hundred college girls as the one not telling the truth. With the pertinacity of most women caught in deception, however, she adhered to her denial. Then all the girls were told, merely as "part of the experiment," to say "Yes" when asked if they had stolen the articles in question, that is to say, in the spirit of investigation, to admit their guilt. The records of all the girls, with the exception of the one above mentioned, showed that they were lying when they made an affirmative reply. Her record showed that she was telling the truth when she said "Yes."

Confronted with these two records, this girl confessed, the other members of the sorority were exonerated, the parents of the young woman made restitution to those from whom she had stolen—a matter of some $500 in value—and she was quietly dropped from the sorority. This is one of a dozen cases in which the Lie Detector has pointed its steel finger at thieves in clubs, fraternities, sororities and even secret organizations.

Henry Wilkens, of San Francisco, was driving one night with his wife and children when they were held up by automobile bandits, who shot and killed Mrs. Wilkens and robbed her husband. Wilkens was accused of plotting with these bandits, prior to the holdup, to "fake" the robbery and kill Mrs. Wilkens. Circumstantial evidence was strong, and the flamboyant newspapers, as usual, tried the case and convicted the man before he appeared in court. He was placed on the Lie Detector—in fact, asked to be so tested—and the Lie Detector declared him to be telling the truth when he denied all connection with the crime. He was later acquitted by a jury when the evidence was presented in an orderly manner and not in the prejudiced methods of the "metropolitan dailies."

With the Lie Detector it has been shown that insane persons—particularly those with feeble or childish minds, the moron and the imbecile—have a different *normal* heart action and respiration from the persons we are accustomed to consider as sane and in full possession of all their mental faculties. As far as these tests have been carried—including about 900 individuals who have been secluded as insane or feeble-minded—it has been shown that the normal heart action and respiration for all persons afflicted with the same form of insanity, or the same degree of feeble-mindedness, is the same. This is a discovery which opens a tremendous field in the study of the insane, because, hitherto, we have considered their physical functions, such as breathing, pulse, muscle action, and so on, as being the same as those of sane persons. It makes far easier and more direct the study of the brain and its mysterious diseases, because it lays a new foundation for comparison of the physical functionings, as well as the mental, of the insane.

Presented also with a record of several hundred successful tests, the freeing of a number of innocent, and the providing of information which has resulted in confessions by many who had committed crimes, comes the capillary electrometer, a development of the galvanometer, as improved and used by Dr. Schneider. This, also, is a mechanical device, though it takes advantage of certain laws of physics. It works toward the same end as the Lie Detector, and, because it reveals truth which the subject may be endeavoring to hide—or, more correctly speaking, reveals the fact that the subject is trying to conceal something—it has been named the "Soul Searcher" by the newspapermen of Portland, where Dr. Schneider has done the greater part of his interesting work with it.

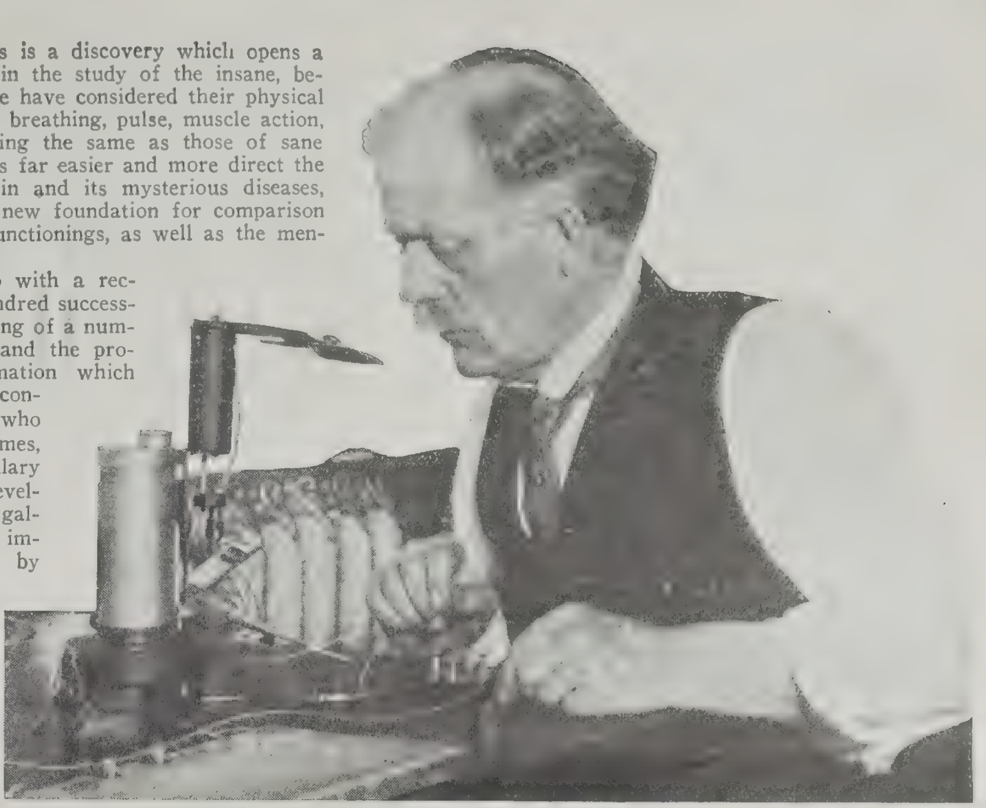


Photo by International Newsreel

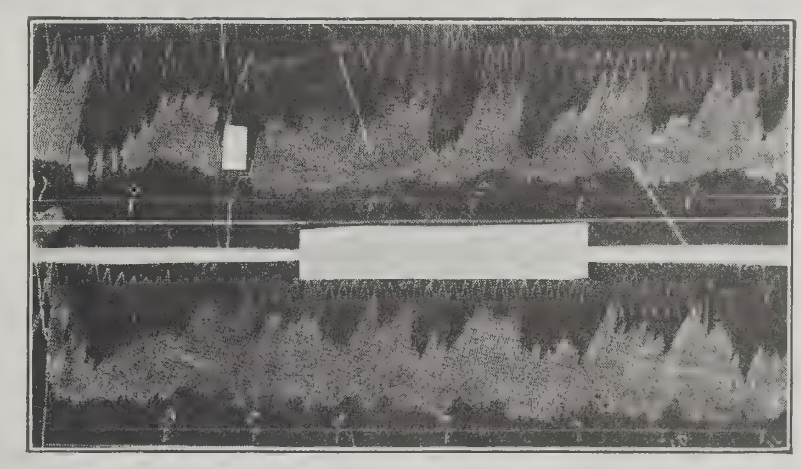
DR. ALBERT SCHNEIDER, dean of the North Pacific College, Portland, Oregon, and his development of the capillary electrometer, by the use of which he offers still another method of learning whether a person is telling the truth.

Where the Lie Detector, or sphygmomanometer, as the scientists call it, gets its records of comparative truth and falsehood from heart pressure and respiration increase due to emotional reaction, the Soul Searcher steals the secret of attempted falsification from the subject without his knowing it. In other words, what the subject fails to say is more important to Dr. Schneider and his truth-seeking instrument than what he does say. The capillary electrometer consists of a series of capillary tubes, minute in diameter, one of which contains a thread of mercury so fine that it can be seen only through the lens of a microscope. The tube containing this microscopic column of quicksilver is graduated in fractions of a millimeter, likewise so tiny that they can be read only through the microscope.

The subject, or suspect as criminologists would prefer to call him, is seated at a table for the ostensible purpose of a mental examination, nothing being said about the crime with which he is believed to be connected, and nothing done to excite his emotions. No record of the "normal" is made, as in the case of the Lie Detector, since such standard is unnecessary, as will be seen from the working of the instrument. The subject is asked to place the forefinger of each hand on a metal terminal, from which a very fine wire runs to the electrometer. The only current applied to the instrument comes from the body of the subject, through his forefingers, and over the almost microscopic wires to the minute column of mercury in the tube. The reader of the instrument is under a hood; his presence may or may not be known to the subject. The eye of the reader never leaves the fractional millimeter scale on the capillary tube, and he says nothing at any time to the subject.



Two records of the same man whom the Lie Detector declared to be lying, and who afterward confessed to the crime of which he was accused, that of theft. Most men, if proved to be lying by this machine, will eventually confess, but women continue to declare their innocence and stick more stoutly than ever to the original falsehood.

An assistant, who apparently is making the test, asks the subject to say the first word that comes into his mind when the assistant mentions another word to him. The assistant begins—understand that no questions are asked, association of ideas being the fundamental theory on which the instrument works—and the subject replies to each word with the first word it brings to his mind. The subject is thus brought, slowly, gradually, and without disturbing his mental balance, to the immediate action of the crime. Let us suppose the man being tested is suspected of having shot another man to death in Portland.

The assistant to Dr. Schneider says, "Gun?"

The subject, if he has any association with a crime committed with a firearm, will almost invariably reply with the name of that arm, "rifle," "pistol," "revolver," or something of the sort. In the majority of the cases, if he be guilty, the first word that flashes into his mind will be the name of the weapon with which he committed the crime.

The assistant says, "Alive?"

If the subject knows that his victim is dead, almost invariably he will answer, "Dead." If he is innocent, or does not know the result of his crime, he will answer either "who" or "where," both interrogatives.

The assistant says, "City?" and if the subject has guilty knowledge of the crime, he will immediately give the name of the city in which it was committed; that is, he will say, in this case, "Portland." If he is not guilty, he will say the name of the city with which he is most familiar, which may or may not be the one in which the crime was committed. And so on, with every idea back of each word closely associated with an idea still more closely bound up with the crime, and its manner and place of commission.

"Now," says Dr. Schneider, "immediately on hearing a word, a guilty man will check his mind, fearing that by his answer he may 'give himself away.' At the exact fraction of a second in which the subject thus checks his mind, looking for a word which shall not connect him with a crime, the current running to the capillary electrometer is checked, the rising column of mercury stops its climb, and we know that we have found in the man what the psychiatrists call a 'complex.' Slowly, without the subject knowing it, his mind, involuntarily controlling the functions of his body, is doing the very thing he feared that he would do inadvertently with words—'giving him away.' We then check back on this complex, knowing that he is concealing something there, and further adroit questioning virtually always brings out the truth, as the subject knows it."

These are two very interesting and very successful mechanical and physical methods of getting at the truth. In both, of course, are combined a great deal of psychology, and, in the Schneider method, not a little autosuggestion, but in the main the instrument, with its unfalteringly accurate mechanical record, is the key to the results achieved.

Comes now Dr. R. E. House, of Ferris, Texas, who, out of more than a decade of searching after truth in an effort to eliminate the once well-known "third-degree" methods of police, and to reduce as far as possible the percentage of innocent men and women sent to our reformatories, has evolved a chemical method of separating the false from the true. Up to the middle of the summer of 1923, Dr. House had made 500 tests of this method, and had achieved a record of approximately eighty per cent of success. He depends upon the releasing of the subconscious mind—which cannot tell a lie, nor conceal any part of the truth—to learn the facts so far as they are known to an individual.

To accomplish this release of the subconscious from the conscious mind, Dr. House uses scopolamin, the basis of the "twilight sleep." Incidentally, Dr. L. L. Stanley, of the medical staff of San Quentin Penitentiary, California, within whose walls Dr. House made a number of tests this summer, has used scopolamin for a number of years in the treatment of drug addicts, and reports uniform success with it. The drug is injected in the House test, and after a few minutes' wait, to allow it to have its effect on the conscious mind, the necessary questions are asked of the subject, who replies from the subconscious mind—which, it is claimed, no anesthetic or analgesic drug can overcome—and, according to Dr. House, these replies are exactly according to the facts as known to the subject.

"The drug numbs the conscious will," says Dr. House, "and, with this dormant, the subconscious mind responds to facts. Questions propounded to a person under the influence of scopolamin invariably bring truthful answers. In more than 500 cases, there is yet to be recorded a failure. I have yet to find a human being who could evade the truth when he was asked for it while under the influence of scopolamin."

It May Strike a Snag

THE greatest obstacle in the way of confirmation of Edward M. Farley as Chairman of the United States Shipping Board, it appears, is his possession of the endorsement of Albert D. Lasker. The incautious Lasker grandiloquently informed the public at a very elaborate—almost an orientally elaborate—dinner that Mr. Farley would follow out the Lasker policies, and Mr. Farley did not deny it. The opinion is gathering force that the Shipping Board does not need Mr. Lasker's rubber stamp now that it is happily rid of Lasker. The latter's visit to the President, which David Lawrence incorrectly reported to have been at the President's invitation, has not yet succeeded, so far as anyone knows, in gaining Mr. Coolidge's support.

It is an interesting bit of gossip how Mr. Lasker, with the aid of trained writers, prepared several articles on Our Merchant Marine for publication in the *Saturday Evening Post.* The series should be appearing about now, but the articles contained so much harsh criticism of certain members of the House and the Senate, that with the gathering doubt of Farley's confirmation, the anxious "author" rushed telegrams to the *Saturday Evening Post* requesting that publication be deferred until after Congress had disposed of the Farley appointment. It is said that the editor of the *Saturday Evening Post* consented, although it is further said that he did not know the reason behind the request.

Incidentally, THE DEARBORN INDEPENDENT has certain material which Mr. Lasker will be powerless to prevent when the time comes for its appearance.

Mr. Lasker's anxiety to be succeeded by one friendly to him, his desire to have a friend at court, is one excellent reason why someone who will turn up the Lasker regime should succeed him. The story of the Shipping Board is unbelievable, and bad as it was before Lasker, it has become worse since. All the more reason why an entirely new man, a man utterly separate from the Lasker organization, should succeed him. Mr. Farley's fitness is not in question; it is a matter of appointing a Chairman who will not be under the slightest suspicion of being interested in any predecessor's behalf.

Our Dirty Doorstep at Ellis Island

AFTER reading the report on Ellis Island made to his government by the British Ambassador (excerpts from which are printed on page thirteen of this issue) every American citizen who has been bred in the respect of soap and water will feel a stirring of indignation that such things can be in this country. The conditions at times and in some respects are simply appalling, and although the emphasis is largely on physical conditions, it is not only the physical conditions that are to be condemned—there are other evils also.

Ellis Island receives all kinds of people from all parts of the world. Some of them are degraded people who ought never to have been permitted to come to these shores; others are unfortunates who would respond to the better conditions here obtainable if given an opportunity; still others are people who are accustomed to as much daily decency as is any American. Considering that Ambassador Geddes investigated in behalf of the people from his country, who are not degraded by any means, and yet who were compelled to endure the Ellis Island horror along with all the others to whom it was not at all objectionable, the restraint which he exercised in his report is extraordinary. It would not be becoming in Americans to show as little restraint.

Ellis Island, in all its arrangements, must be placed on the American standard for everything. If, as Ambassador Geddes suggests, there should be a separate landing place for the Jews, let that be provided. In any case, for Jews and Gentiles the arrangements must be on a par with the common standards of American decency. The impression one gets from all reports of observers is that Ellis Island has been permitted to run down to the level of the lowest classes received there; it has not been kept up to the level of the government which is superintending the reception. This may or may not be because so many who are not Americans are employed as official receivers of immigrants.

There can be no argument whatever as to the immediate need for a wholesale clean-up at Ellis Island, now that our shame in this respect has been so completely disclosed to the world.

And there ought not to need much argument to revise our system of handling prospective immigrants. It is cruelty of the most heinous kind to permit people of any country to obtain passports, pay their ocean passenger fare, only to be rejected at Ellis Island. Worse even than that is the custom which consuls abroad pursue of viseing passports and then sending messages ahead that such-and-such a person is not admissible to the United States. Such heartless jockeying with human beings has only to be viewed in its thoughtless though systematic cruelty to win absolute condemnation. We should, as a humane nation, forestall this suffering and loss and waste by settling such matters at the United States consular offices abroad.

There is no demand for any relaxation of the immigration laws; demand is rather for their stricter enforcement regardless of influences brought to bear against it. But there is a demand that we recognize our moral responsibility toward those multitudes of people who come ignorantly here only to be returned.

Is the League "Political"?

IS THE League of Nations a political issue? The question is revived by the action of the University of Michigan in refusing the use of a university building for a public meeting to discuss the League, the refusal being based on the judgment that the League is a political question. From one point of view the University is justified. That is to say, whether the League ought to be made a political matter is a question, but that it has been made a political matter is a fact. The motives which made it a political question have been widely judged as unworthy, but unworthy or not they succeeded. The League is a political question not only in the United States but all over the world. Which in itself would not be so reprehensible had not politics fallen to so low a plane all over the world. But politics being what they are, they besmirch whatever can be brought within that category. In a profound sense all great economic questions are political—the League of Nations, capital and labor, banking and currency, sanitation and education—all of these are political. There is nothing pertaining to the national welfare nor to the peace of the world that is not political. And even if the League of Nations were to be raised above the mean and vicious partisanship which the University of Michigan means when it uses the term "political," it would still be political in the highest sense. Every university today teaches subjects that are inevitably political in character, and it is possible that most of them teach political economy with a class bias which is the foundation of partisan bias.

Helpless Static!

THE waves of propaganda beat against the eardrums of the populace. There is no defense. Some evenings ago, hapless radio enthusiasts tuned in on a wave length emanating from the capital of the state of New York.

It developed that a new theatrical enterprise was being inaugurated with fitting ceremonies. Governor Alfred E. Smith was introduced. He directed his remarks to the theatergoers of Albany, but they may well have fallen upon the ears of a million radio fans, scattered through the length and breadth of the land. The governor, in a few well-chosen words, expressed pleasure that the state capital was to have the entertainment of the Shuberts. In his home city of New York, Governor Smith said the Shuberts had won a deserved reputation for clean entertainments.

Static defend us!

"Patent Insides" and Propaganda

IF THERE is propaganda in a country newspaper, the editor himself is responsible. Even though it be sent to him in "boiler plate" or "ready prints" or "patent insides," he still has full control over the material which he admits to his pages.

The business of furnishing "ready prints" has developed to a point which gives the editor of a country paper as complete control of the matter appearing in the "patent inside" as he has of that printed on his own press. The opportunity for selection is so broadened that a number of papers can be supplied in any town without duplication of any article, and the working sheet in each auxiliary specifies exactly what features the editor has selected, his choice being denied a rival in the same territory, except in the special matter comprising the propaganda.

The modus operandi is this:

The propagandist prepares, or has prepared, a column, or two, or three, or a page of copy. This he takes to the auxiliary house to be put in type, from which plates are made, and proofs mailed to selected lists or to all of the patrons of the house with the notation that "We are authorized by the American Bankers' Association"—(to give a specific case)—"to supply this service in plate form free of charge, the metal to be returned to us after use."

If the newspaper has insufficient space for the service on the home pages, the same plates will be printed on the inside pages, but only on specific order. The work being paid for by the propagandist, the responsibility of the plate house ceases here.

Like service is open to any interest desiring publicity of this sort. There is no partisanship in it except that of the propagandist and the editor who uses the service. In plate form, for use in the home pages, the matter is easily subdivided for scattering in available vacant spaces, or for the purpose of omitting any portion not deemed available. When ordered on an "inside" it is usually printed as cast, in full columns, since that is the form of all features and the only practicable manner of its use.

This form of propaganda is in common use by political committees, corporate interests, and the like, and was indulged in to a large extent by the government during the World War.

Educational propaganda on every side of every question is desirable. The country editor is as much justified in printing propaganda of the American Bankers' Association as he is in printing Sunday school lessons furnished by a religious body. The plate makers are justified in sending out such service for responsible bodies. But unless the whole business is to fall into disrepute the one-sided character of it should be amended. Editorial breadth should be mingled with business acumen. If the American Bankers' Association wishes to use a country newspaper to justify the money system which charges the farmer twelve to fifteen per cent interest, why should not a balancing portion of publicity be given the opposite point of view? "Boiler plate" could make itself the true American Forum if so conducted.

What Does It Matter?

THERE is no monopoly in beauty. A masterpiece of art or literature is no less a thing of wonder, though its creator's name be lost in the dusk of the ages.

The other day the world of art was upset by the publication of a book entitled, "Rembrandt and his School." The author, John C. Van Dyke, professor of History and Archeology in Rutgers College, assailed the genuineness of most of the paintings accredited to the great Dutch master. There are between 800 and 1,000 "Rembrandts" in the world. Professor Van Dyke says that perhaps thirty-five are genuine. The others he ascribes to a host of painters who flourished in the seventeenth century.

Professor Van Dyke's assertions brought the expected reaction in the world of art. Some experts scoffed. Others agreed in part. Many kept silent.

To those who do not affect art, but who enjoy art, the Van Dyke disclosures will be of little consequence. An honest person who admires a work for the work's sake will not be shaken in his admiration, because of the doubt as to the authorship. In the Metropolitan Museum of Art in New York are fifteen paintings accredited to Rembrandt. Professor Van Dyke says that none is genuine. Perhaps he is right. But the pleasure of gazing at them should have been as great the day after his disclosures as it was the day before. The qualities which were admired as Rembrandt's work are just as admirable as some other's creation.

Mr. Ford's Page

IT WOULD be an excellent experiment if, when business becomes dull and the dullness balks every effort to dispel it, men would turn their attention to an element too often neglected in business, namely, the element of neatness, tidiness, orderliness. Just as an experiment. There is something to learn from it. There are benefits to be gained by it. There is a new state of mind and the liberation of new forces dependent upon it. There is a reaction from it which is difficult to set down in words, and as difficult to prove in figures, yet it is pretty certain that the man who has made the experiment will be able to detect its influence on his balance sheet.

There is no sphere of work where this principle does not apply. The home, the farm, the factory, the mine—all of these are fields for the application of tidiness. In the home, of course, we expect it; the home is judged by it. On the farm, its lack is noticeable when lack there is. In factory and mine there seems to be a tradition that disorder signifies a great rush of business—industry is commonly thought to be too busy with important matters to give attention to such commonplace things as tidiness.

> *IT WOULD pay in money if managers of homes, farms, stores, railroads and factories should give attention to order and cleanliness in their establishments. Heaps of waste material means untidiness but it also means inefficiency. "Show me your scrap-pile and I will tell you how your business is." One coat of rust costs more than a year of wear. Dirt and neglect are the most deceptive forms of camouflage because they conceal the exact state of the machine or structure. In factories, waste is composed of elements of value to the business. On farms, waste is composed of elements which menace the business. Untidy concerns begin to slow up, their men become slovenly, their work becomes unsound, their output dwindles, their profits disappear. System, order, tidiness are profitable in a score of ways.*

Yet it is almost invariably the fact that where disorder and uncleanliness exist, there also exists inefficiency. The two things seem to go together. And it is almost impossible to offer a criticism, because it is immediately taken to be personal. Clean up a man's farm or shop for him, and likely as not he will take it as an affront to himself. He feels it to be a reflection on something very intimately connected with his whole habit of mind. In this way he confesses that there is a connection between the workings of his mind and the workings of his business—confusion in one breeds confusion in the other.

While there are farmers who keep their places tidy (and the men who do so will be found to win a higher measure of success than the others), many do not. One has only to ride along the highway to see on every hand evidences of untidiness. Weakened fences, unpainted and slant-doored barns, weed-grown lanes, farm implements lying out in the weather—these are common sights. And they are not to be explained by lack of money so much as by lack of taste and initiative. In a short drive the other day, one estimated that more than $30,000 worth of farm machinery was seen exposed to the weather. That cannot be explained otherwise than by the mentality of the owner. Bad crops or good crops, money or no money, the care of tangible wealth is the first sign of a good business man.

One layer of rust does more damage than a whole year of wear.

It is the same on railroads. A certain railroad was taken over and cleaned up. This meant that from roadbed to roundhouse everything concerning it was cleaned up. The men were cleaned up, too. There is no more reason for overalls not being washed than there is for right-of-way not being clear. The custom of polishing the locomotives was introduced. Indeed, the locomotives were so finished with polished bands and rods that cleaning them was necessary if they were to preserve any semblance of their original appearance. It looked like extra labor. It seemed as if an extra cost was being added for mere "show." But was it? Take this single example as an indication how tidiness pays on a railroad.

As everyone knows it sometimes happens that accidental breakages of driving rods occur on the road, damaging the locomotive, sometimes damaging the roadbed, always involving the very heavy costs of train delays, and sometimes even causing wreckage. There is no better way of determining the condition of a locomotive than by going over it with a view to its appearance. Thus, in cleaning the driving rods of a locomotive the other day, a cracked one was discovered. Ordinarily it would not have been discovered until it had broken on the road, if that policy of tidiness had not been in force. So that what looked like an extra, needless cost turned out to be a very valuable economy.

The principle uncovered here is the same everywhere—If you want to know the condition of anything, clean it up. Dirt and disorder hide all sorts of defects which will turn up very damagingly at unexpected times. Cleaning the thing up exposes the defects, shows where work needs to be done at a time when it can be done with the greatest effectiveness and economy.

In every business it can be proved that untidiness, disorder, is actually created out of elements which are either of value to the business, or are a menace to it.

The first fact—that disorder may be created out of elements of value to the business—can be illustrated by the railroad or the shop. It is usually *material* that constitutes untidiness in these places, heaps of odds and ends and forgotten parts, thrown hither and thither in corners and scrap-piles, until a considerable bit of wealth is thus accumulated in uselessness. The railroad mentioned was found, upon examination, to have almost as much material scattered around under the classification of "junk," as it had in actual use. The leak into this classification makes a heavy drain on some businesses. It is the custom of one organization, when it goes to look over a factory, to ask first, "Let us see your scrap-pile." From that it is perfectly easy to deduce how the factories have been conducted. In cases like this, the untidiness is created out of elements valuable to the business.

Now, to illustrate the fact that untidiness is sometimes made out of elements whose presence is a menace to the business, take the farm. The enemies of the farm are vermin, parasites and weeds. The latter are the friends of the first two. Farmers who think their fields are clean while their lanes are choked with weeds and every fence is fringed with all manner of predatory plants are mistaken. They harbor in the heart and around the boundaries of their farms the nesting places of the very enemies which they fight afield. The untidiness is not only a matter of appearance, but a matter of labor and money and decreased production. Yet, many a farmer will resent as "unpractical" the suggestion that he clean up all over and all around, and keep things clean. But in so cleaning up he is not only adding to the appearance-value of his property, he is adding to its productive value as well. And he is doing more than that, he is creating a state of mind, an orderliness of thinking, that will inevitably make itself felt in all his arrangements.

The policy of system, order and tidiness has another advantage: it helps attract the right kind of employes. The system employed in a shop is almost immediately reflected in the employes. Industries in which the greatest degree of physical disorderliness reigns, show the lowest output, the lowest wages and the lowest profits. When a shop force is accustomed to dirt, all its operations are clogged, just as a neglected piece of machinery is clogged. Waste of material, waste of time, duplication of effort, slovenliness of work all go with untidiness; whereas clean-painted corners, businesslike system, insistence that the work shall be sound and that material shall be respected—these have the power to put men in a right relation to their task, awaken their self-respect, and make them partners in an achievement rather than parasites on a half-dying industry.

The old college professor said: "There's a heap of morality in an electric light on the campus," and there is a heap of business wisdom in just plain orderliness and tidiness in the shop. Men who can't learn to be tidy have no place in a growing business; but most men like it, and will help to maintain it, for the profit is theirs as well as the industry in which they work.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Too Many Banks, or Soon Will Be, Say Bankers

Corrective Measures to Limit New Institutions Sought by A. B. A.

By A. R. PINCI

CONVICTION is beginning to crystallize in this country that there are too many banks, or, stated differently, that if there are not too many banks in the United States today, it will not be long ere, at the present rate of increase, there will be too many of them.

Such a belief would carry little weight or interest if it were the vague or chance remark of a layman, but now that bankers in the hallowed financial precincts of New York are beginning to confess to the fear is a sure indication of trouble or alarm.

Nor is that all. Even the American Bankers Association—a voluntary, unincorporated association of about 23,000 banks—has practically admitted the same thing, although indirectly, with hints that Congress and the legislatures must provide adequate corrective measures. In fact, official Washington has taken cognizance, not always official, of the complaint, but up to the present time no solution seems feasible; which means that solutions have been suggested, but that each in some way steps on the other fellow's toes.

The numerical abundance of banks in this country is now a timely subject because for eight consecutive years the American Bankers Association has been studying it, pro and con, at its annual conventions.

If this has escaped general notice it is due to the fact that officially and technically the discussion has been about "branch banks."

At the forty-eighth annual convention last year some well-concealed bitterness existed between the two factions within, one opposing and the other encouraging branch banking. Since 1916, when the American Bankers Association, with only two dissenting voices, condemned branch banking in any form, until the present, this opinion has not been reversed, although care has been taken, as might be expected, not to make the resolution operative or mandatory. Did this happen, a split within the association would be inevitable.

National Branches Permitted

THE topic was particularly threshed out at the 1922 convention, but nothing has come of it, in spite of the fact that the association's preponderant opposition is supported not only by the chief financial organs of the country, but also by D. R. Crissinger, then Controller of the Currency, now Chairman of the Federal Reserve Board, who has formally declared that if it had been his duty to make the laws of the various states he would not have permitted branch banking.

Offhand, there seems to be no direct relationship between branch banking and the number of banks, but it is because the former subject conceals the latter that the debate has not been fully understood or appreciated. The exact relationship exists in this—that where a huge and prosperous banking institution can open a dozen branch banks, or banking branches, or "offices," in a perfunctory way by means of a comparatively slight dent to its surplus and, where necessary, a reapportionment of its capital, a new institution would be subject to many difficulties even in establishing itself as a single office. This is especially true in case the community at a given point may not actually be in need of or even require a new bank.

It requires always a certain amount of time and soliciting to organize a new bank up to the point of being ready to receive deposits. New banks are started—but not always on the presumption that another bank is needed by the community, and individuals do not subscribe to stock in a new bank unless there is some definite indication of profit.

Just as banks must amalgamate or consolidate in this highly competitive era to protect themselves against the handicap of a disastrous overhead, it often happens, conversely, that a division of opinion within a banking institution leads to the sudden scission of the weaker element which forthwith starts out with a bank of its own. Under such circumstances no thought need be given by the secessionists to the vital question of whether the community can commercially stand two banks where one sufficed before. The new bank, sometimes amounting to a spite bank, depends upon and usually starts out with the patronage of friends, most of whom must necessarily be recruited from the original institution. Under these conditions, the plain depositor, who forms the backbone of banking, figures not at all.

However, there is another kind of banking parthenogenesis.

In certain states, and generally in certain cities, the principal banks have begun to expand by means of branches, and while at first this was supposed to be a prerogative available solely to state institutions (in a score of states) it led to a condition which, according to the Controller of the Currency at Washington, threatened "the national banking system in these respective states," thus causing him to extend the same privilege in the same localities to national banks.

Controller Crissinger explained the situation as follows in a letter to a member of Congress:

"There is very much misinformation which has worked itself into a propaganda that is wholly unwarranted. The ruling that I have made does not in any way affect the state of Missouri, but one of your national bankers out there, acting upon the advice of his own attorney, established an office or agency in St. Louis, which has started the rumpus. I have particularly ruled in every instance that no branch office or agency would be authorized by me in states where state institutions did not have like facilities. It ought to be clear and it is fair, and there is no reason for anybody misunderstanding it.

"I have, on the other hand, permitted national banks in the large cities of states that permit state banks and trust companies to have agencies or offices, the privilege to have like agencies or offices, and no place else, and I think that is fair and equitable, and is, I believe, authorized under the National Bank Act.

"If it had been my duty to make the laws of the various states of the Union I should not have permitted branch banking, but, unfortunately, twenty-two states, either by permissive action of the state superintendents of banking or by direct authorization of the legislatures of the states, do permit agencies, offices or branch banks.

"This has brought about a condition which threatens the national banking system in these respective states. To illustrate: In my own state of Ohio we have a bank in Cleveland operating under a state charter, with forty-six branches in that city, and it is now extending its operations throughout the state, and has absorbed—practically put out of business—all the big national banks in Cleveland, and we have, I think, four small national banks left."

Congress has several bills on the subject of branch banking, but judging by the activity, or inactivity, of the Senate and House committees, very little action may be expected because a dilemma evidently exists, and any kind of legislation would fall unjustly upon some banks and communities.

Marshall Cousins, commissioner of banking of the state of Wisconsin, said that "from practical experience in both state and national banks" he can see but little difference between them, thus dissenting from Mr. Crissinger to the extent that the latter believes that "if the backbone of the national finances is to be preserved we have got to preserve the national banking system in order to accomplish it, if we are to preserve the system which has been the backbone of the country since 1865."

"They are all organized for the same purpose," Mr. Cousins states, "and should render the public the same service. There should be no friction between the banks of the two systems. It is for their own good and for the public good that there should be co-operation.

"I believe we will more closely approach the ideal situation when for the welfare of nation-wide credit and trade, and of national solvency, the two banking systems, the state and the Federal, each supreme and useful in its own functions, can be made as one in matters of mobilization of reserve, currency supply and efficient supervision.

"The Congress and the legislatures of the respective commonwealths should be urged to place upon the statute books laws which will bring this about."

Nevertheless, as things stand now, there is friction between the national and state banks, and this friction has prepared the way for a somewhat acrimonious competition in expansion, and, instead of subsiding, there are indications that the race is just about beginning, with Congress on the one hand, the legislatures on the other, and the American Bankers Association quite helpless.

Even Washington, the capital of the United States, directly under Federal control, has not been without its banking troubles. Bankers in Washington have told me that the capital has too many banks—about a dozen little ones have been started since the war—and in that city it is quite easy to assess the exact banking need, since its banking is essentially routine and approximately fixed. The bulk of private deposits, excluding business, is by the army of government employes, whose pay checks on the Treasury of the United States are deposited twice each month and frequently exhausted before each fortnight passes. Yet the competition for this business is amazing.

One Has Fifty Branches

NEW YORK offers a different situation entirely, although it is in New York City that I have heard the more serious complaints about too many banks.

There is a state bank—the Corn Exchange Bank—which has more than fifty city branches, each a complete bank in itself. About the only relationship it bears to the parent bank is in having to report to the general officers and for the managers to obtain approval in making any loan exceeding $500 or $1,000. With its resources of more than two hundred million dollars, each branch would roughly be worth four millions.

A four-million-dollar bank in even a sizeable town would be quite an institution, as would be any corporation representing such a sum. Yet in the metropolis by itself it would cut no ice, and that is why there are several dozen such branches studding the city at intervals of fifteen or twenty blocks. But that is not all.

In the vicinity there are always from one to three or four other banks, which has the effect of furnishing excessive banking facilities in cluster-form at certain points and no banks at other points.

While certain big downtown institutions are planning or actually opening additional offices or branches, it likewise comes to pass that other banks, feeling the weight of the overhead, are being absorbed by the more opulent organizations. In a few cases a feeble attempt is made to retain some shred of former prestige by use of the former name to distinguish the new branch.

While ancient and honorable institutions are losing their identity and practically disappearing altogether by absorption, new banks are started outright on capitalizations of from $250 000 to $2 000,000. In order to make plausible their being they are consecrated to the financial service of the neighborhood, particularly the needle trades.

This not being enough, all sorts of novelties are devised to attract accounts, and the one that has fallen hardest upon the clerks is that of late banking hours.

One bank started some years ago as an all-night bank and eventually gave way to an all-night pawnshop. Later came the eight a. m.-to-midnight bank, which now runs in two shifts, from eight to eight. As this bank by clever publicity has managed to keep well to the front, another was started less than half a mile away. with a view to serving the theatrical and Broadway district that should keep open until ten p. m.

To adopt this system would not be difficult for other banks, except that it would entail the tremendous expense of two separate working forces and separate sets of books and duplication. So the matter was scotched by devising another idea—of keeping open until five or six o'clock each evening, the period between three o'clock and closing time being limited either to receiving deposits only or paying special pay-roll checks; this, of course, apart from the now old plan of opening for an hour or two Saturday evenings for the benefit of the working classes.

At first all this special service seemed to be the field of the state banks, which owing to their very organization were naturally closer to the community than could be the national banks themselves. But now the national banks in some cases exceed the most liberal of local banks in an effort to get business.

That takes no account, as is evident, of the savings banks, which perhaps are the least liberal, since they do nothing except to take deposits or honor withdrawals, and their work within is nowhere as complicated as is that of the commercial banks.

Fear Big-bank Competition

IN SAN FRANCISCO there is the Bank of Italy, originally started by Italians to serve the growing Italian agricultural community there. This is now said to be the biggest bank west of the Mississippi, and has not only established a place in New York by taking over two institutions still running as "independent banks," but has arranged for an international bank somewhere in Italy. That bank, which has been the cause of acrimonious exchanges in California, is about twenty years old, if the writer is not mistaken, but it has attained its size by taking over, buying, or otherwise controlling lesser local banks in the vicinity.

There is no doubt that a great deal of the opposition to the branch-bank fashion has a source, especially among the smaller bankers situated at strategic points, in the fear of being forced out of existence.

A big banker said that the little bank has no place in this highly organized and centralized age, and that inasmuch as jobs are safeguarded in ninety-nine cases out of a hundred, and even the authority that goes with them, the complaint is unnecessary, especially since it is better to be part of a big institution.

The little bank does not seem to regard it that way, however. Most of the smaller American banks have taken seriously the complaint about the British or Canadian system, in which, by centralization of almost entire financial power in the hands of a few and often absentee capitalists, profits are taken from the locality where they are produced to enrich communities a few or thousands of miles away.

Mr. Frame, quoting the chairman of a Canadian Royal Committee appointed to investigate branch banking, said that "the great objection to the Canadian banking system is that it concentrates the banking profits and influence in two large cities, Montreal and Toronto. This also applies to all business—manufacturing, trading, insurance and mortgage loans."

Since England thirty years ago had eighty-six per cent of its banking power distributed among seventy-five or eighty banks, according to Mr. Frame, and now through amalgamations and consolidations is controlled by five institutions, the fear that it is but a step from the present fashion to the British system is not groundless.

In the report of the Federal Legislative Committee of the State Bank Division of the American Bankers Association there appears this paragraph:

". . . this committee, and this division, stand unanimously for the protection and well-being of that great body of American citizens designated as the 'Small Town Banker,' who must abandon his chosen profession and seek other means of livelihood if branch banking is not in some way limited."

Waldo Newcomer, of the National Exchange Bank of Baltimore, speaking in behalf of branch banking, put this question to the last convention: "When a national bank finds itself confronted with such competition and finds that it is losing its business through its inability to take the same step as its competitor, what possible courses of action are open to it?"

Speaking in favor of the national bank as a branch-bank competitor of local institutions, Mr. Newcomer answered his question as follows:

"First, it can supinely sit down and lose its business to its competitor;

"Second, it can surrender its national bank charter and become a state bank. Such a course, if generally followed, would lead to the destruction of the national bank system and seriously threaten to disrupt the entire Federal Reserve System, of which the national banks are the backbone. Furthermore, such action would be an admission that the formation of a branch is good banking, but that the national banks are not to be permitted to be progressive.

"Third, it can temporarily surrender its charter, become a state bank, absorb a bank with branches, or form branches of its own and renew its national charter.

"Fourth, it can establish branches and call them

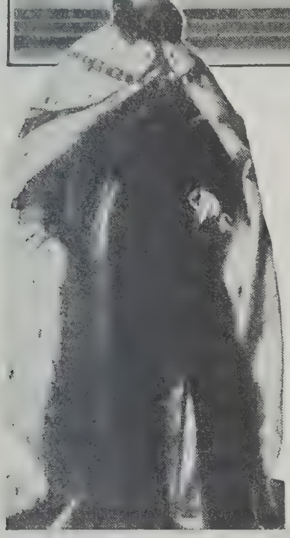
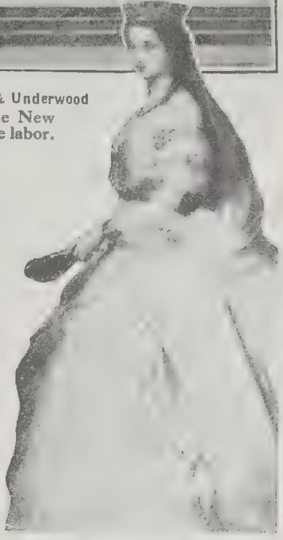
(C) Underwood & Underwood

The memorial to Benito Juarez, in the Alameda, facing Juarez avenue, Mexico City, by many considered the finest memorial yet erected in the New World. This monument was cut in sections from pure white Carrara marble in Italy, and shipped to Mexico City, being assembled there by native labor. Juarez was the revolutionary leader who ordered the execution of Maximilian.



MAXIMILIAN I,

From a painting by a contemporary Spanish artist, which hangs in the National Museum, Mexico City. It is said to be an excellent portrait of the unfortunate Hapsburg prince.



CARLOTA,

The Belgian princess who became Empress of Mexico, and is now known as "the Royal Recluse of Bouchout," from a painting by a contemporary Spanish artist, which hangs in the National Museum, Mexico City.

The True Story of Mexico's Hapsburg Emperor

Belgian Princess and Maximilian's Consort Lives in Castle in Brussels, More Than Eighty Years Old

By HARRY H. DUNN

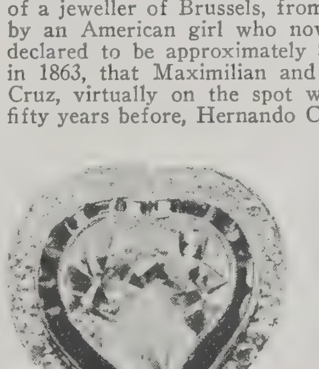
LIVING simply, yet surrounded by every comfort, even luxury, that royal whim might decree, a woman, whose beauty was once the toast of the courts of Central Europe and who for more than half a century has maintained her place as the most tragic figure in the history of the New World, recently celebrated her eighty-third birthday anniversary in a beautiful, but isolated, castle a few miles from Brussels. She is Charlotte, princess of Belgium, former empress of Mexico, daughter of Leopold I, first king of the Belgians, and widow of Maximilian I, second emperor of Mexico.

In the Castle of Bouchout, where her life has been spent since Napoleon's action in deserting the luckless Hapsburg prince plunged her into a hopeless cloud of insanity, it is doubtful if the unfortunate Carlota knows that another year has been added to her life. Certainly she has no knowledge of the World War, for, being a member of the Austrian royal family, no armed man of the Central Powers ever set foot within the domain which, to her childish mind, is still an empire. Being also subject of a solemn treaty by which guardianship of her was transferred to the then king of the Belgians, Leopold II, from the emperor of Austria, it is equally certain that no armed Belgian ever has passed before her sight. The world for her has stood still since, on a sunny morning in June, 1867, the rifles of a gang of ragged *pelados* sent half a dozen bullets into the heart of Archduke Ferdinand Maximilian of Austria, as he stood before the adobe wall of the place of execution at Queretaro.

So many years have passed over this silent recluse of Bouchout that doubtless the majority of American men and women believe her dead. Probably very few know the true story of the tragedy of Maximilian and his empress, while still fewer, if any, ever have heard the strange tale of the Hapsburg jewel, the Bleeding Heart Diamond, one of the famous of the lesser diamonds of the world, which was so deeply involved in the career of the two lovers and their sorrows. When the Archduke Ferdinand, second son of Archduke Franz Karl and Archduchess Sophie, and therefore brother of Franz Josef, emperor of Austria, was married with royal splendor, in Brussels, to Princess Marie Charlotte Amelie, daughter of King Leopold I and his queen, Louise of Orleans, in 1857, the Austrian emperor sent, as one of his gifts to the bride, a diamond of heart shape, approximately half an inch wide in one direction and nearly three-quarters of an inch in another.

This diamond the man who was to die as "Emperor of Mexico" had set in peculiar fashion for his bride. First, he surrounded it with rubies rectangular in shape, and following the heart-outline of the stone. Then, outside of these, he again followed the strange natural curves of the diamond with a number of smaller diamonds, until the whole gave the appearance of a heart dripping blood. Reading the history of the House of Hapsburg, and that of the House which Maximilian endeavored to establish in Mexico, there seems to be some foundation for the belief which prevails throughout Mexico that with the gift of this diamond to the young Charlotte Amelie passed to her some of the evil destiny of Franz Josef's line.

Strangely enough, this ring was one of the things to which the Empress of Mexico clung most closely when, after appealing in vain to Napoleon for aid for her husband whom the Bonaparte had placed on the shaky throne of Montezuma, she fled to her father's court in Brussels. There, for some reason, possibly fear resulting from the tales which already had begun to gather around its crimson-tinged glory, the Bleeding Heart ring was sold. Eventually it came into the hands of a jeweller of Brussels, from whom it was purchased by an American girl who now wears it. Its value is declared to be approximately $60,000. From the time, in 1863, that Maximilian and Carlota landed at Vera Cruz, virtually on the spot where, three hundred and fifty years before, Hernando Cortez had begun the conquest of the empire of the Montezumas, until, in 1867, the Emperor of Mexico sent his beautiful empress to plead with Napoleon for troops to maintain the New World Empire, Carlota wore the Bleeding Heart. According to Mexican tradition, which by this time amounts almost to a myth, and according to some of the old records in the *Biblioteca Nacional*, in Mexico City, this ring became a sort of fetish to the ill-fated daughter of the first King of the Belgians.



"The Bleeding Heart" ring, once owned by the Empress Carlota, around which has been woven a wealth of legend.

Whether or not the ring had aught to do with it, the star of Maximilian sank rapidly and immediately when his empress carried with her to Europe the strange jewel, the only diamond of that natural shape ever found in the world. The marriage of this beautiful Belgian and the Austrian prince, who differed so much from the other sons of the House of Hapsburg, likewise differed from most other royal matches in that it was an alliance of the deepest love, proved often by Carlota, and most by the ardor with which she took up and worked for her husband's cause, even though all her efforts were devoid of the results she sought. Even death was made easier for the brave gentleman whom Napoleon had striven to make an emperor because it was reported to him that Carlota had died in Brussels, though as a matter of fact she still lived and is living yet.

The story of Maximilian is the tale of a man of honor, honesty, high moral character and noble ideals who fell among thieves; who was betrayed by the man who sent him to the throne of Mexico, betrayed by the men who surrounded him, and finally murdered by the fanatic peon, Juarez, who was unable either to understand or to appreciate the character of such a man. The official murder of Maximilian was merely one of the first of such crimes that have blotched the history of Mexico from the time that Cortez tortured Montezuma in an effort to find hidden treasure in 1520 to the murder of President Venustiano Carranza, a helpless old man fleeing for his life, a few years ago.

It is commonly supposed that Maximilian was sent to Mexico without the consent of the Mexicans, yet as a matter of fact he was invited to come to Mexico by the Conservative party, on July 10, 1863. The invitation was extended by the three leaders of that party, meeting in Mexico City—President Almonte, former President Salas, and Archbishop Labastida. As a matter of fact, both the Conservative and the Clerical party were united in this movement for foreign intervention, because they could see no hope for Mexico under the control of the Radicals, or revolutionists, led politically by Benito Juarez and in the field by Porfirio Diaz, who afterward became president, setting up a dictatorship far more severe than the empire Maximilian tried to establish.

This triumvirate selected a foreign prince to prevent rivalry between native factions, to surround the empire with the halo of royal ancestry, and because England favored the selection of Maximilian. The United States was known, of course, to oppose foreign encroachments in the New World, but there was some doubt at that time, 1863, as to how long the United States would exist as a nation, and whether, if it did continue to exist, the Washington Government would be in a position for some time to enter formal protest. The termination of the Civil War, leaving the United States intact, and with a large and unoccupied Federal army, had more to do in accomplishing the overthrow of Maximilian and the decision of Napoleon to leave the Austrian archduke to his own devices than did all the efforts of Juarez or Diaz or any and all the rest of the Mexicans.

Thus backed, tentatively at least, by Austria, France,

The Lean Days Have Come to Wall Street

Speculative Public Quits Market and Professionals Are Content With Scalping

By CHARLES ALBERT COLLMAN

PERIODICALLY Wall Street wakes up to find that it has killed the goose that laid the golden eggs, that is to say, the speculative public. The financial district of New York has entered upon the period of lean pickings. Million share days have joined the limbo of past performances. Brokers succeeded in feeding up their customers with stocks that are now ten, twenty to forty points below the prices at which they were bought. The losing speculators who quit are the lucky ones. Less fortunate are those who put up more margins, and are now hanging on, while interest is slowly eating up their gambling capital.

The bulk of the brokers, in default of customers, are amusing themselves in trying to scalp eights or quarters from one another's trades. In fact, what money most of the commission houses are making is derived from the interest charges they mulct from their customers' accounts. The board member of a Stock Exchange firm, if he knows you well, will whisper to you confidentially: "I'm willing to let the house have all the commissions from stock sales. If they'd only give me the profits from the interest account, I'd be satisfied." To the speculator who has been caught on the wrong side of the market, carrying charges are costly. He has to pay interest on the eighty per cent of capital borrowed on his transactions. His broker, however, compounds such interest with every monthly statement he renders to his customer. That is one of the tricks of the brokerage business.

Speculative Wall Street loves to follow in the wake of some individual who has won distinction by a special aptitude for manipulating stocks. The favorite of the hour is Jesse Livermore, the marketer of Piggly Wiggly and other interesting share creations. Livermore not long ago chilled the enthusiasm of the gambling coteries by making public a statement in which he expressed the opinion that the stock list of the Exchange was overburdened with dubious issues of patent medicine, talcum powder, chain store and tea specialties. He further disheartened his admirers by pulling up his stakes in Wall Street and going abroad. He let it be known that he had closed out all his pools, sold his stocks, and had even had all the telephone connections with brokerage houses taken out of his offices.

Bond Sellers Suffer, Too

MANY pools had at that time ended their campaigns successfully. But, according to some rather gloomy stories now circulating in the Street, the more belated stock operators were less fortunate. One large group had been deftly manipulating the shares of an industrial corporation, when Livermore's pessimistic utterances caused a market slump that ruined their campaign of eight months' duration. The insiders were so badly hit that they had to take their blocks of stock off their brokers' hands and pledge them with banks to tide over the lean period.

Similarly some industrious bond syndicates have had their security issues thrown back upon their hands. These underwriters guarantee to sell a stipulated amount of securities within a certain time, and when they fail to find a market, they are constrained to carry their bonds themselves. This freezes up their capital. If there is anything a bond man dislikes it is to invest his own money in his gilt-edged securities. It is his business to get the other fellow's cash.

So varied and devious are the schemes concocted for beating the Street, so many are the tricks and subterfuges that are being put over, that an indulgent public would be dismayed and astounded by the dubious morality displayed by habitués of Wall Street.

There is something in the giddy spirit of the Street, in the temper of its eddying crowds, the over-confidence of its atmosphere, that exercises a peculiar influence on its frequenters. Perhaps this is one of the reasons the Street is the scene of so many "corners," which are merely holdups of groups of speculators, or holdups of corporations through control of certain securities, while the methods of holding up the public are too numerous to be detailed.

This craving for appropriation or misappropriation, often strikes fire in the most unexpected quarters. There is a bank in Wall Street which for more than two generations was distinguished above all others by a reputation for conservatism, probity and fair-dealing. It was regarded as the peer of New York's commercial banking establishments. When all the other members of the clearing house suspended specie payments during a time of panic, this bank alone insisted on paying its old commercial customers in gold to ease their credit in the trying period. But the time came when a president of this institution died, and the banking world was shocked by a disclosure which followed the death of this supposedly wealthy man. It appeared that for years he had deliberately falsified the bank's statements to conceal the fact that he had stolen upward of $600,000 from the accounts of one of his own customers. The victim was an aged widow who had on deposit in the bank something like two million dollars in a so-called "inactive" account. The fact that she rarely touched this money enabled the president to operate the fraud without detection.

Not so long ago, a hard-headed and foxy old financier secretly incorporated a company by whose means he intended to put over something on his intimate associates. Had his name appeared in the incorporation papers, his scheme would have been given away. So he named a tried and trusted confidential clerk president of the new organization. In taking this step, it became necessary for the financier to sign over temporarily to his clerk the property owned by the company, together with a large amount of securities.

Finally the time arrived when the old gentleman considered it expedient to disclose himself as the head of the new corporation, and enjoy a laugh at the expense of his friends. Then he made a surprising discovery. The trusted clerk, the dummy president, had left the financier's service, had opened offices in which he had installed the company, and insisted that he was the rightful owner of the property and the securities. The facts of this remarkable story were disclosed by a lawsuit which the financier was compelled to institute to get back his own. He didn't long survive the ridicule of Wall Street.

Another amazing interlude is an apt illustration of the ways of the Street when times are slack and insiders are hard pressed to make a living. One day a "customers' man," whose name will be given as "Brown," called to see the partners of a New York Stock Exchange house not very noted for high principles, and not very strong as to capital, but eager for profitable customers. A "customers' man" is one whose business it is to steer into brokers' offices moneyed men with a penchant for stock gambling, or foolish youths with rich fathers, after having whetted their speculative appetites. He acts as office manager for his own select group of traders, and supplies them with alleged market information of an exclusive character.

Brown, who proved to be a fluent talker, made the following proposition to Jones brothers, the brokers: "I can bring you a profitable customer," he suggested. "He's a young millionaire from Long Island, and trades only in thousand-share lots. This boy's a plunger, and if you let him operate along his own lines, and give him good execution, you'll run up bigger commissions than any other house in Wall Street."

The brokers expressed a willingness to give the prospective trader the hospitality of their office. The commission on a round transaction of a thousand shares is $250, and if the speculator gambles to the extent of only 20,000 shares a week, there is a profit of at least $5,000 to the firm. The only question was, what did the customers' man want in return for his services?

Brown, when questioned on this point, said that he wanted a position as the firm's office manager, at a salary of $500 a week. He was very insistent on this point, and a long argument followed, at the end of which Jones brothers agreed to pay him a weekly salary of $300 as long as the millionaire trader made their office the scene of his operations.

The young market plunger, who will be known as "Robinson," made his appearance a few days later. He insisted that he must have private quarters. Robinson quickly proved himself to be an experienced stock gambler. He plunged heavily, and his market ventures were profitable both to the firm and himself.

The luxurious room set apart for his use was the scene of many a choice luncheon party, participated in by Brown, the Jones brothers, and Robinson. The new customer was voted a good fellow by the partners, a valuable asset to the firm, and a coming man in the Street. Then suddenly there occurred an episode that caused a brutal rupture of these pleasant relations, and made the brokers regret that they had ever admitted the "Long Island millionaire" to their offices. To explain this dénouement, it will be necessary to relate the previous career of young Mr. Robinson.

Market Collapse Brings Wealth

SOME years before, this young man had shown dangerous indications of becoming "the greatest market operator in Wall Street." He had the requisite nervous temperament, the vivid imagination and the plunging instinct. His method was to take an active stock, and give his broker a blanket order to sell a thousand shares on every half-point decline. He thus pyramided his orders. In a sudden break in the market, his profits were huge. If the market ascended, his losses were crushing. By trading in this fashion, he lost his entire inheritance.

A near relative then died, and the plunger was in funds again. Once more he risked his money on the desperate hazard. He lost out. But he still believed in himself. He had undiminished faith in his convictions—or delusions. He was a congenital bear. While still a boy, he had seen his father lose his entire fortune in the panic of '93, and this calamity had rooted in his mind a belief that all stocks and bonds were worthless paper.

The bear plunger had a woman relative whose estate he expected to inherit some day. He persuaded her to lend him $50,000. His friends had already pronounced him a failure. But now the young operator again commenced to manipulate the short side of the market, a half a point at a clip.

Invariably, after his trying days in Wall Street, he suffered from violent physical reactions. One night he lay in bed a wreck, and the doctor was called in to stimulate his weakened heart. Once more his last hope was gone, and he confided to an intimate friend that he was utterly ruined—cleaned out of his last dollar.

But the next morning, before his brokers could call upon him to cover his sales, the market unexpectedly opened down, and a sharp break followed. The turn had come. Once more Robinson was in his element. The year that followed was marked by a declining tendency, punctuated by sharp breaks, slumps and even panicky conditions. The situation seemed to justify the young bear's peculiar theories on the stock market.

Robinson now plunged to the limit in Wall Street's whirlpool. His frail physique was sustained by elation over a series of unusual market triumphs, his success convincing him that he had a mentality superior to the ordinary run of men. It may appear incredible, but in eight months he had cleared $900,000 merely by selling the market short.

Robinson bought a seat on the Stock Exchange, and established five brokerage offices in various parts of the city. He expanded into a wild spender. He lavished his thousands on three hobbies, automobiles, rare books and diamonds.

Three years later, due not so much to speculative as to domestic reasons, which need not be dwelt upon, the young bear plunger had lost his Stock Exchange seat, his brokerage offices and his quickly acquired fortune. But with the confidence of the habitual gambler, he knew that, having once conquered the stock market, he could do so again. All he needed was another stake.

He managed somehow to scrape together a few thousand dollars with which to attempt another assault on the market. But so low were his funds and his credit, that he had no means for providing for his living expenses without encroaching on this slender capital. In this predicament, he ran across a man whom he had formerly employed in one of his brokerage offices in the flush days. This was "Brown," to whom he suggested a scheme by which they could support themselves until fortune smiled again.

According to the plan adopted, Brown was to apply for a position as customers' man, with a salary of $500 a week, in return for introducing Robinson as a millionaire trader in some brokerage house. But at the end of every week, Brown was secretly to split his salary with his former boss, Robinson.

At Mercy of Employe

BROWN, as has been seen, succeeded in putting the deal over with the Stock Exchange house of Jones brothers. For the first month or so, he scrupulously shared his salary of $300 with his associate. But as luck began to favor Robinson's stock gamble, Brown reasoned that he had done enough for his former employer, and thenceforth refused any longer to split his weekly pay. A bitter quarrel followed between the two men, whose little arrangement was all unknown to Jones brothers.

Robinson, angered at his former employe, determined to get him out of his job. He banished Brown from his private trading room, and confiding to Jones brothers that he could no longer tolerate the man, demanded his dismissal.

The suggestion was entirely agreeable to the brokers. Besides being anxious to oblige their supposedly wealthy client, they had really no use for Brown, and his departure would save them the expense of his salary. So the next day the partners called Brown into their private office and told him he was dropped from their employ.

A surprise awaited the brokers. Brown, their customers' man, laughed in their faces. "You want to bounce me, eh?" he retorted. "I'd like to see you put it over." And leaning toward the partners, he whispered something that caused them to lose countenance.

Brown, who was an observant man, during his short period of employment by the brokers had "got something" on the firm. He had discovered that Jones brothers, whose capital had become impaired, had been compelled to borrow large sums from another Stock Exchange house to carry the extensive market commitments of their new thousand-share customer. The arrangements into which Jones brothers had entered with the other firm was a direct violation of a rigid rule of the New York Stock Exchange. Its disclosure would have led to their expulsion from the Exchange. And now Brown openly threatened that, in case they discharged him, he would go before the board of governors and expose them.

The two brokers regarded each other uneasily. They retired to a corner of their office for a consultation. There was no doubt about it. They were at the mercy of their employe. So they decided to put the best possible face upon the matter, and courteously informed Brown that they had reconsidered his dismissal, and decided to retain him in their service.

Robinson was infuriated when he learned that he was unable to force the dismissal of the customers' man, but presently there were other matters that compelled his attention to the exclusion of this petty grievance. The stock market began slipping from his control, and his recent profits to melt away. In this desperate extremity, fearing to lose the last of his working capital, he weakened his preconceptions of the market situation, and commenced to switch from one side to the other. Miserable days of suspense followed, during which Robinson's capital was at times wiped out temporarily, only to be recovered by a hair's breadth before the market's close. Jones brothers, who at length realized the true situation, were terrified lest their reckless customer involve them in some enormous loss. Finally they refused to carry his trades over from day to day, compelling him to close out his transactions before three o'clock every afternoon.

The inevitable end was not long in coming. One day Robinson saw his last dollar disappear in the noon-hour whirl of a rising stock market. Keeping up his front to the last, he left his luxurious office with a jest on his lips, but while descending the great office building, he collapsed in the elevator. He left his brokers in debt, and the furnishings of his private room were seized by his creditors.

It was the close of another Wall Street gambler's career.

Football's Most Important Factor: the Kick

Famous Coach Outlines His Views on Autumn Sport's Great Requisite

By FIELDING HARRIS YOST

Director of Athletics, University of Michigan.

MORE big football games are won or lost each year through the kick than all other elements of the sport combined. The kick is the most important thing in football.

In recent years our leading critics have lamented the lack of good kickers. They say the game no longer produces men who can kick with the height, distance and direction of the noted booters of 15 and 20 years ago and they deplore what they call the failure of coaches to direct more attention to kicking, to place greater emphasis upon its value and to develop better kickers.

Personally, I do not share the oft-expressed belief that we have gone back physically. I believe we are just as good today from a physical standpoint as we were fifteen and twenty years ago. I believe that football today has just as many men who are as strong, as virile, as fast and as clever as the leading players of the day when mass play was the thing. I do not believe that the open game has reduced physical efficiency in football.

To back up my contention that the men who participate in athletics today are as well developed physically as the men of 20 years ago I ask you to consider the records made in track and field events in the last 12 months; the records made in swimming and in other sports. Hardly any record that stood twenty years ago stands today. A large number was smashed in the last year. This actual record of record-smashing events should disprove the spreading belief that we no longer are producing men of physical strength. They are as good today as they ever were, and better.

Taken for granted that the physical type in the present style of football is as good as the type of men that carried mass formations, what explanation can then be offered for the apparent lack of kickers?

I believe that we have more good kickers today than we had in other years. My definition of a good kicker is a player who can average 40 yards in a big game, meaning a contest in which both elevens are nearly evenly or evenly matched. If the statistics of the game show that the kicker averaged 40 yards or better, then he averaged 50 yards or better, for kicks are measured from the scrimmage line to the point where the ball lands and you can add 10 yards to each of these measurements since the kicker is rarely less than 10 yards behind his scrimmage line when he makes the kick, so the ball travels 30 feet or more before passing the point from which the measurement is taken.

In the Michigan-Ohio State game last year Kipke, of Michigan, averaged 47 yards on 13 kicks and Ohio State did not return the ball on any of these punts. Kipke's performance in this game is the best I have ever seen. No exhibition to equal this was given in the days of mass play nor since that time. In the same game Workman, of Ohio State, an unusually good kicker, averaged 42 yards per kick. I do not remember a game previous to that when such an excellent exhibition of punting was furnished by kickers of two major teams.

But, only in a few big games do kickers average as high as forty yards. Sometimes it is less than 35. There is rarely more than a few yards difference between the average of the kicker of one team and that of the opposing team's kicker. This is significant.

In any game the offense and defense must be equalized as nearly as possible. This provides the competition. The defense must always be strengthened when the offense is. One cannot overbalance the other.

Before football was opened up, the kick did not play the prominent part that it does today but as the football rules were changed to open the game the kick grew in importance. Coaches spent more and more time developing kickers and their duties were steadily increased.

Now, while the kickers were being developed the coaches had to go about developing defense plays to meet the kicking game. There had to be developments on the receiving side which would discount the advantages that would otherwise be gained from the kick. Where coaches used to spend one hour in drilling their squads in defense plays against kicks they now spend 10 hours. The kick used to be a side issue and now it is the main issue.

In the old days when kicking was a minor part of football the defense was inadequate. Kicking was comparatively unimportant and therefore coaches did not bother. Because of this lack of defense the kicker went about his business unmolested. He took his time and he got away his kicks. Old records will show no better kicks than now.

Twenty years ago there were few good teams in this country. You could count the topnotch teams on the fingers of one hand. About two in the East and as many in the West ruled the gridiron. Games were decided by lopsided scores, as a rule. There was little competition in games.

Today it is different. There are nearly 500 college and university teams in the United States. The stupendous growth of football has caused the development of thousands of good players where formerly there were only a few dozen. In the East, Middle-West, South and the Far West can be found major teams. Each of these sections has one or two teams that may be a trifle better but one cannot point definitely to any single team and refer to it as the best in the country.

All of these teams have been coached much on the same basis. All have recognized the value of the kick, developed it and developed a defense against the kick. While most of them have one or more good kickers, all of them have a defense against the kick and while there are several times as many good kickers in the United States today as there were in the days often referred to they are unable to show the records in kicking that used to be made because of the remarkable development of the defense for the kicking game. Just as good distance is made now.

While the kick is the most important thing in football, kicking is the most difficult. By kicking I mean punting, drop and place-kicking. It is all a hazardous undertaking with innumerable chances for failure. The most tense moments in any football game for me are those when I hear the quarterback snap the signal for a punt and the situation remains tense for me until the ball is downed.

So many things can happen.

The kick can be blocked. Many are. When this happens it is often recovered by the opposing team. On a blocked kick the ball may be sent behind the kicker or to either side, often out of bounds.

A kick may also be pressed, meaning that the kicker's opponents by coming through his line are on him before he can take the needed time to make the kick. This may result in a short kick or a sliced kick, sending the ball out of bounds.

It may be a poor kick. This can be caused by a poor pass from the center to the kicker. Maybe the ball is high, causing the kicker to throw himself out of position reaching for the ball. Or low also causing him to lose his position. Or to either side. A bad pass loses a second or fraction thereof and this loss gives the opponents the needed opportunity. The kicker over-hurries and finds it almost impossible to kick true.

The wind may cause a kick to fail. The wind often diverts the ball in its course from the center to the kicker. Also, the wind frequently diverts the ball after it is kicked, and between the hand and foot.

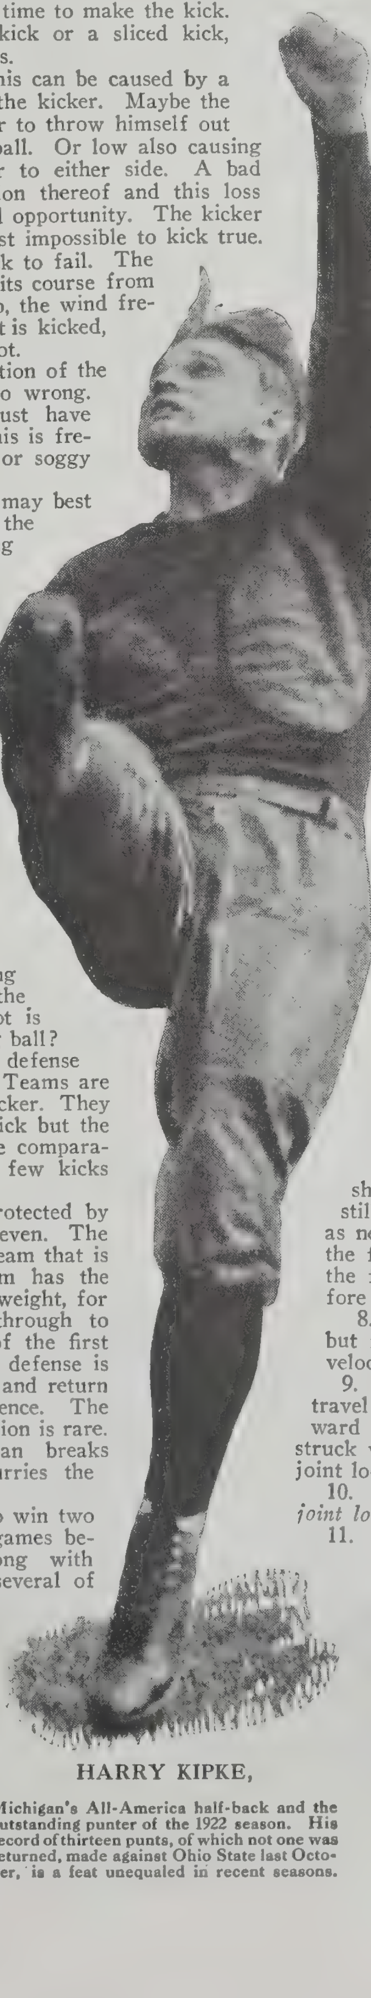
It is possible for the condition of the ground to cause a kick to go wrong. To kick true the kicker must have sound and firm footing and this is frequently denied him on a wet or soggy gridiron.

How difficult it is to kick may best be understood by considering the difficulty experienced in hitting a golf ball. In the latter case you have a round ball that is stationary. You have as much time as you choose for changing your position, getting the proper stance, practicing your swing, aiming and finally hitting the ball. How many players can hit a golf ball true and get the desired distance and direction? How much more difficult it is, then, to hit a football, that is not round, with the toe of the foot, meet the ball at exactly the right spot and time it perfectly with seven husky young men hurling their bodies at the man whose left or right foot is swinging to meet the dropping ball?

The main point of the defense against the kick is pressure. Teams are taught to hurry or press the kicker. They try, of course, to block the kick but the instances of kicks blocked are comparatively rare while on only a few kicks is the kicker not hurried.

Generally the kicker is protected by three men. He is rushed by seven. The odds are always against the team that is kicking. The defending team has the advantage in numbers and in weight, for the men that are coming through to harass the kicker are men of the first line. The second line of the defense is scattered to receive the punt and return it behind adequate interference. The kicker who always has protection is rare. Generally at least one man breaks through his defense and hurries the kick.

In 1921 Michigan failed to win two of her Western Conference games because something went wrong with kicks. Against Ohio State several of the Ohioans got through and were on top the punter so fast that his kick went almost straight into the air. It struck the ground near the scrimmage line and bounded. Johnny Stuart, an Ohio State halfback, picked up the ball and carried it across the Michigan goal line. This touchdown was the turning point in the game; the play defeated Michigan.



HARRY KIPKE,

Michigan's All-America half-back and the outstanding punter of the 1922 season. His record of thirteen punts, of which not one was returned, made against Ohio State last October, is a feat unequaled in recent seasons.

In the Michigan-Illinois game of that year both teams fought desperately and the entire game was a punting duel, played between the thirty-yard lines. Michigan won the game 3 to 0 through a goal from the field.

Every big game that Michigan played in 1921 was decided by kicking. Most big games are decided the same way.

Position is the vital thing in football and kicking enables a team to play position against opponents. If you can keep your opponents inside their thirty-yard line they will not be a menace to you.

At times you find an opposing team that has an inferior kicker. Then, of course, you rely upon kicking to give you the desired advantages. An exchange of punts means a distinct advantage in position provided your backs are as able to return punted balls as theirs.

On a kick there is always the chance of the receiving side fumbling. If you have fast ends who can tackle well your kicker is almost bound to bring the desired break.

Coaches today do not alone have specialists coaching their punters to punt properly from scrimmage, but hours are spent each week developing men to kick off. This seems unimportant to the average football enthusiast, for the ball is kicked off only at the start of each half and after scoring, but many games have been lost on the first kick because the kicker got the ball away poorly.

On the kick-off the kicking is rarely done by the team's punter but generally by one of the linemen. He has been schooled daily in this task. Not alone one man but two, three, and four are educated in this single phase of play, for in the kicking end of football no detail, however unimportant it appears to the average spectator, is overlooked.

One man is developed for punting. Sometimes this man also does the drop or place-kicking, but frequently this is done by a specialist. Many teams on taking the field have in their line-up three kickers with distinct duties, one to kick off, one to drop and place kick and one to do the punting. Many teams have two men capable of doing any of these things.

To show how detailed the coaching on kicking has become I want to introduce here the written instructions given to all punters at Michigan:

1. Stand with feet slightly spread, the kicking foot about twelve inches to the rear, weight well balanced and mostly on the forward foot.
2. To receive the ball hold your hands about midway between the shoulders and waist. Do not hold them too high.
3. Catch the ball easily without "fighting" it.
4. Step up with the right foot not more than twelve inches in advance of the left. Then take a natural step with the left foot and you are ready to kick.
5. While taking the above steps adjust the ball in your hands. The right hand should be to the rear of the ball with the fingers well spread along the right side of the ball and the thumb on the upper left side. The point of the ball should be in the heel of the right hand. The left hand merely steadies and guides the ball and should be toward the front and on the left side.
6. The ball should be held about waist high with the long axis level and inclined about fifteen degrees across the path of the kick.
7. As the kicking swing is started the ball should be released by the left hand but should still be held by the right hand and guided down to as near the foot as possible. Try to lay the ball on the foot rather than drop it on. This will eliminate the fault of the ball blown out of true position before you kick it.
8. The kicking swing should start rather slowly but increase in speed until it reaches its maximum velocity just as the foot strikes the ball.
9. It is the "sting" in the kick that makes the ball travel and to get this the leg should be carried forward with the knee bent until just before the ball is struck when it should be snapped out straight and the joint locked just as the foot meets the ball.
10. *The toe must be turned down and the ankle joint locked and rigid* as the ball is struck.
11. The foot should first meet the ball a little above knee high but should follow through with it as far as possible—that is, above the kicker's head.
12. The ball should be made to fit into the arch of the instep and slightly across it. Imagine that you have ink on your shoe laces and see how many crosses you can make them print on the ball when you kick it.
13. To get a good spiral the foot should be "cut across" the ball as the kick is finished. The spiral is aided also by having the ball inclined across the foot as directed above. You must control your kick so as to kick to the right spot and have plenty of height so that the ends can tackle the receiver as he catches the ball.

A City of Seven Hills and Interesting History

Richmond, Virginia, Penniless Six Decades Ago, Today Is Leading City of the South

By GEORGE H. DACY

IN A way the seven hills of Richmond, Virginia, are as extraordinary as the seven hills of Rome, for they are geographical guideposts which lead through the gateway of a new South. Richmond, the capital of the Confederacy, was scourged and blasted by the conflict between the North and South. When the war ended, no bridges remained, every railroad was wrecked, the James River was obstructed by sunken craft and every highway leading into the city was impassable. Bankrupt, the city owed $2,000,000. The ruins of Rome after that memorable conflagration when Nero fiddled accompaniment to the roar and crackling of the flames presented no more barren picture than did Richmond.

The rebuilding of Richmond is a remarkable achievement. In 1866, the only assets of her citizens were courage and resourcefulness. Today, her 210,000 inhabitants operate industries which represent an investment of more than $97,690 000. Her commercial sales amount to a half-billion dollars annually. Her bank clearances aggregate $3,050,000,000 a year. Her civic, social, educational, religious and residential advantages have been developed so that she ranks among the leading cities of the country and is known everywhere as the reconstructed gateway to the South. Under most severe handicaps, these attainments have been consummated in the lifetime of an ordinary man.

Topographically, Richmond long furnished perplexing problems to engineers. All told, the city contains more than twenty-six square miles scattered helter-skelter round and about the seven hills which rise like ancient sentry towers amid the long rows of residences. Transportation from one hill to another was unsatisfactory until engineering skill finally bridged the gaps between the miniature mountains and linked the hills together by a chain of bridges and viaducts. There are now five large viaducts in use, as well as two pedestrian and two vehicular bridges over the James River. There is probably no city in the country handicapped topographically as is the former hub of the Confederacy.

Richmond folk doubtless procured their priceless treasures of pluck and indomitable courage from their forebears, the English cavaliers, who in 1609 discovered the site upon which the city was built one hundred and twenty-eight years later. Colonel William Byrd laid out the city and although he was not prophet enough to foretell the phenomenal development Richmond was to make, he was wise enough to select a site which was ideal as far as proximity to the James River and accessibility to the surrounding agricultural country were concerned. Colonel Byrd did not overestimate the importance of the tortuous James. Richmond for at least a century held an important place among the ports of Dixieland. Vessels of the world called regularly at her anchorage. Latterly, development of the James River has not kept pace with the improvements in modern shipping. The eighteen-foot channel of the James—it increases to twenty-one feet at high tide—is not navigable for huge freighters. However, a direct New York freight steamship line is operated profitably from Richmond. Determined efforts are now being devoted to a campaign to induce Congress to straighten the sharp bends in the James River and to provide a thirty-foot channel from Richmond to Hampton Roads, one hundred and five miles. If the project goes through, Richmond will resume her high position in the world of international shipping.

The White House of the Confederacy, now the Confederate Museum, is one of the oldest buildings in the city and is an excellent example of early Southern architecture. The Museum contains the most valuable and comprehensive collection of War Between the States relics in existence.

Commercially, Richmond occupies a splendid strategic position, as the city is located in the neck of a geographical bottle through which flows practically all the transportation headed either North or South. Nature has also been kind to this Southern city in providing it with water-power facilities which are almost matchless. Richmond occupies both banks of the James River at exactly the right point where the tides of the sea are halted on their inland flow by the river waters which have rushed through miles of rocky falls. Another natural advantage is the wide belts of industrial coal fields which contain a billion tons of coal in a fifteen-mile radius of the city. This bed extends through five counties and covers an area of one hundred and ninety square miles. The first coal which was systematically mined in the United States was taken from this vein. Thereafter, the field was but little exploited, due to poor management. Now, under scientific experts, the vast coal fields of Virginia are being developed. A point has already been reached where four hundred tons daily are being mined and delivered to Richmond industrial plants. The quality of this coal is as good as the best which comes from the West Virginia mines, according to recent government inspection and comparative tests.

American iron working and brickmaking originated in the vicinity of Richmond about three centuries ago and these with tobacco manufacture have long held the honors as staple and inherited industries. At present, Richmond has the largest lithographing establishment in the South; the largest wood works and baking powder plants in the world; the most extensive blotting paper industry in America; the biggest chewing gum plant in the South; the greatest bottled flavoring extract factory in existence; the largest wholesale mail order and automobile jobber's supply houses in Dixieland; the oldest and largest mica mills under the sun; the largest and most elaborate cigar factory ever built; and one of the largest locomotive plants now in use. It is the home of the largest fertilizer manufacturing company now in operation. One of her flour mills, which was established in 1795, is grinding 600,000 barrels a year.

Unlike most industrial and commercial cities in this country, Richmond is a ninety-seven per cent pure American city. Only three per cent of her population are foreign-born. The native Negro population aggregates thirty per cent, while the remaining sixty-seven per cent consists of native whites. A city survey shows that at this writing the residents of Richmond spend about $1,000,000 a month for luxuries that are purveyed by 300 wholesale and 2,500 retail dealers. This is quite in contrast to the Richmond of 1866 which had no assets and $2,000,000 worth of liabilities. Last year the Federal Government collected $1,225,848 in duties on goods imported into Richmond whereas twenty years ago such customs annually amounted to less than $20,000. The city has spent $1,750,000 in harbor improvements and has built municipal wharves adequate to handle the entire flood of existent river traffic.

Richmond is replete in reminders of historical events of bygone days, while it also is rich in the atmosphere of the new and awakened South. Ancient buildings and residences, ornate with mammoth and graceful porticoes over which trail ivy, rambler roses or Virginia creeper, beautify the city and compare favorably with the more modern specimens of architecture. The group or community system of home building has added to the attractiveness of many of the leading residential sections. Anywhere from a dozen to two or three dozen families combine and purchase a tract of land whereon they build houses of a uniform type and design. A minimum value for a standard house is set and no one can erect a dwelling in the grouping which does not exceed in cost the lowest limit. In some instances, real estate companies have sponsored development projects of this character while in other instances, the citizens themselves have worked up the scheme cooperatively. The system has made for an attractive uniformity in the size and type of residences and has also featured commendable and general ornamentation of homes and lawns.

Appreciating the lack of education rife among many of the laboring classes of the Old Dominion, the Richmond authorities several years ago threw all their centrally located junior high schools and grammar schools open at night to the general public. The city provides and pays the teachers who instruct the adult scholars. Practically all the subjects in the average grade school and high school courses of study are taught. Right now, more than 20,000 regular scholars attend the novel night school classes. The city supplies all the textbooks for the night as well as the day schools.

For the sightseers, Richmond is a veritable treasure chest. On one hill stands a simple cross which marks the spot upon which John Smith stood when, taking possession of the territory for England, he designated the locality as "None such." Adjoining another of the outlying hills is the scene of the Pocahontas-John Smith episode, when the fair Indian maiden interceded at the risk of her life to save the valiant explorer from being burned at the stake. In the same vicinity is a remarkable old house known as "Pratt's Castle" that was built years ago by a retired sea captain who had queer ideas about architecture and who incorporated a smattering of the designs of every country in the world in his extraordinary mansion which is one of the most unusual houses in the entire South.

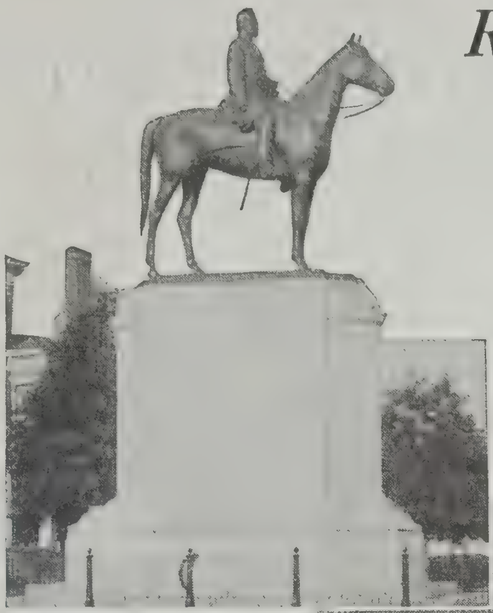
In 1785 one of the first Masonic lodges in the United States was organized in Richmond, where the first fraternal hall of that order was erected. On the Clay street line in Richmond, the first electric cars in America were successfully operated for many years before this method of transportation was extended to other municipalities. In Hollywood Cemetery, two of our Presidents—James Madison and John Tyler—are buried within ten feet of one another.

The Capitol Square in the heart of the city covers twelve acres. The Capitol Building was designed by Thomas Jefferson. New wings were added to the original building about twenty years ago. An outstanding relic in this famous structure is Houdon's statue of Washington. The governor's mansion, an equestrian statue of our First President, the old Bell Tower, the peals of whose bell years ago summoned the early inhabitants of Richmond to important town meetings, the State Library with its famous collection of books and old manuscripts including the parole given by Lord Cornwallis, the State Museum, the new State Office Building as well as a number of statues in honor of prominent Virginia patriots and statesmen are dotted here and there throughout the expansive tract.

The Virginia capital is a city of venerable churches among which St. Paul's is particularly important. It was here that Jefferson Davis and Robert E. Lee regularly attended services. It was in that church one Sunday morning that President Davis of the Confederacy received the message from General Lee notifying him that Richmond must be evacuated. St. John's Church was dedicated in 1741 and is one of the oldest places of religious devotion now in use in the United States. The present Monumental Church is erected on the site of Richmond's first theater which was destroyed by fire in 1802 after having housed the convention which ratified the Constitution of the United States.

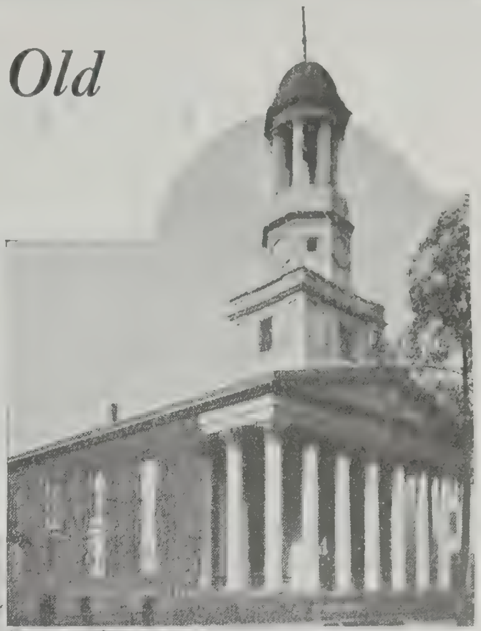
The Confederate Museum is also an interesting century-old structure. It was presented by the city to Jefferson Davis to be used as the White House of the Confederacy. Close to the Old Medical College Building, reputed to be one of the best examples of Egyptian architecture in America, is the site of the first art academy founded in America. A decade after the Revolution, a French officer in the Colonial Army established there the American Academy of Science and Fine Arts. John Marshall's old home, more than 175 years old, the old Robert E. Lee mansion, now the home of the Virginia Historical Society, the former residence of Edgar Allen Poe, Monument avenue with the Stuart, Lee and Jackson statues scattered along its way—all are permanent landmarks. The rich plantations bordering on the James River—all adorned by magnificent colonial mansions—and picturesque Jamestown Island, the site of the first English settlement in America, with its old tower built in 1617, its monuments and the remodeled church, in which Pocahontas was baptized and married, are appropriate environments to Richmond the city that has been developed into one of the leading municipalities of the "land of cotton."

Richmond a City Where Old and Modern Blend



Stonewall Jackson's monument, at Boulevard and Monument avenue, is one of the memorials to Southern leaders from which Monument avenue, considered one of the handsomest thoroughfares in this country, derives its name.

The State Capitol, originally designed by Thomas Jefferson while he was minister to France. The foundation was laid in 1785 and the building completed in 1792. As originally constructed, the building was of plain Grecian architecture, the wings in which the Senate and House of Delegates meet being added in 1902. The governor's office and those of many other state officials are located in the Capitol Building.

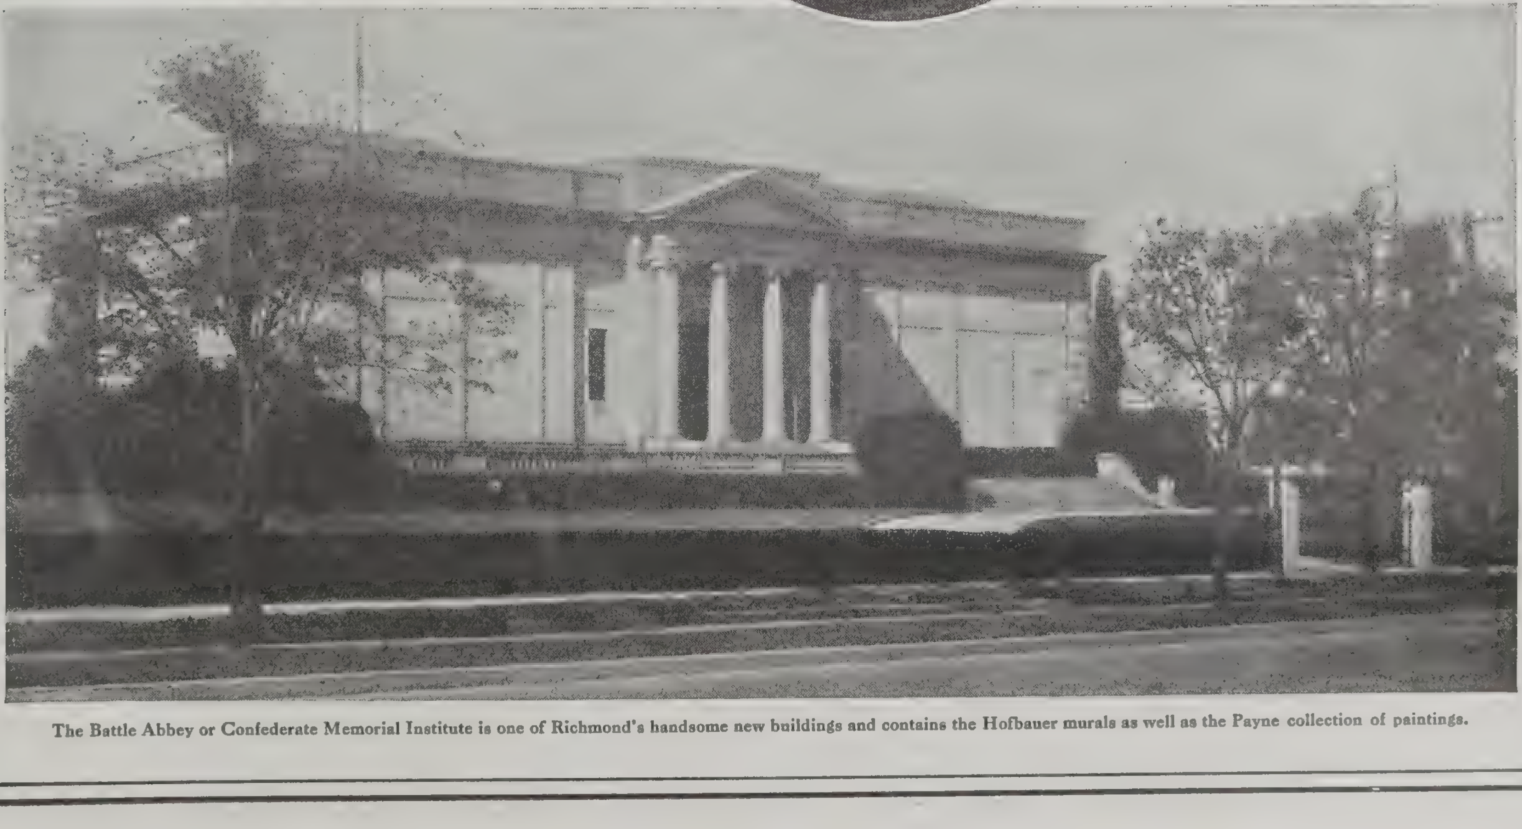


St. Paul's Church, one of Richmond's historical and beautiful houses of worship. Practically everything in St. Paul's is a memorial, several of its windows ranking among the most beautiful in America.

Richmond's financial district comprises a close grouping of some of the city's largest buildings located on Main and lateral streets between the wholesale and retail districts and close to the chief manufacturing section. The post office is shown in the right foreground of the photo.

Circle—The governor's mansion is another excellent type of old Southern architecture, its spaciously beautiful grounds ornamenting the Capitol Square.

Lower Main street, the principal business section of Richmond, is ever changing, a considerable portion of the new construction done during 1922 at a cost of more than $15,000,000 having been spent in buildings now going up in this vicinity.



The Battle Abbey or Confederate Memorial Institute is one of Richmond's handsome new buildings and contains the Hofbauer murals as well as the Payne collection of paintings.

A Broadway Farce: Ending Ticket Scalping

Each Year Theater Brigands Are Threatened—and That's All That Happens

By PETER SCHUYLER

MANHATTAN the Wise is now viewing with the greatest interest the four hundred and ninety-ninth episode of that super-comic serial, "Putting the Ticket Speculators Out of Business," which has just been released for Broadway consumption by the theater managers who made it. In no place but New York would it be possible to revive interest in a subject which everyone knows is as dead as a doornail. Year after year, as regularly as the season approaches, the announcement is made that the brigands who traffic in theater tickets have reached the end of their tether and that the plundering of the public must be stopped. Sometimes the declaration comes from a small group of theatrical uplifters with a queer name. Sometimes the gilded promise is held out by a recently elected member of the state legislature who is yearning for celebrity. Frequently the producers of the stage attractions, needing a little healthful publicity and desirous of restoring themselves to public favor, burst forth with a broadside against their avowed enemies, the "specs." It is always funny to read the same old stuff. It is always diverting to watch the bubble swell, glow, and burst. But it is never funnier nor more diverting than when theater managers themselves rise en masse and solemnly swear that the atrocious practice of trimming the common people must be abandoned once and for all. Nothing ever comes of the outcry, the promises, the threats, the hopes, and the columns of angry letters in the newspapers. No one, in his senses, ever harbors the delusion that anything will be done to remedy the evil actually. Yet we all get so excited when the finish of the ticket "specs" is mentioned!

For a long time the theater managers insisted that it was impossible for them to do anything to protect the public against the ticket highbinders. They said, "We have no connection whatever with them and we will welcome anything that will abolish them." There was a period when simple-minded folk really believed what the managers said. To anyone who observed the string of telephones in the speculators' offices and who could add two-and-two, it was evident that the wires led to theater box offices. Still that did not prove the box office speculator combination. At length the managers got into a row with the playwrights and, after a long wrangle, a standard form of contract was drawn up between them. In that contract the producers agree to include in the royalties they pay the authors a percentage of all receipts which come from ticket brokers. That ended at once any further assertions from the managers that there was no connection between themselves and the ticket speculators. Some other defense had to be erected if the graft was to be preserved.

No Attempt to Enforce Law

IN 1922 a measure was introduced into the New York state assembly fixing at fifty cents the maximum amount that could be charged, above the box office price, on tickets for public amusements. The theater managers professed themselves as being in favor of it. The established ticket bureaus, which had never charged more than fifty cents advance (no matter how great the demand) for their service, really sponsored the measure. The outlaw "specs," whose motto is "Get all the traffic will stand and then some," fought the bill. But it became a law, although friends and foes alike realized that it was probably unconstitutional, and would not and could not be enforced. In any event there never has been an attempt to enforce it. For an interval the easy-going public dreamed that all would be well and that it could see a show occasionally without mortgaging its clothing to do it. It was soon awakened rudely to the realization that not only were things not better but worse. The established ticket brokers, who lived up to the law, could only supply a meager selection of tickets while the gentry, for whom the ceiling was the limit, got the choice locations for all the successes and collected on them to the last possible nickel. The public once more began to growl a bit. That meant future trouble for the managers. So another bone had to be thrown to it to keep it quiet.

With a flourish of trumpets a plan was announced which had the approval of the Producing Managers Association and which would at last extirpate the ticket speculators root and branch.

Strange to say, the scheme emanated from a speculator, Joe LeBlang, who had built up a highly successful business under a Broadway drug store where he ran a cut-rate ticket agency. Not only had LeBlang made a lot of money for himself, but his institution had served as a first-aid station for many stage attractions in distress. He was, in a sense, a philanthropist of the theater. He has been given other titles by producers (who disapprove completely of his business and its purpose), but it must be remarked that Mr. LeBlang has thrown out the life line to many a sinking show.

It is the custom with managers, who have a dwindling attraction on their hands, to furnish LeBlang with a certain number of tickets. These he sells, on commission, for half the price asked for them at the box office. In other words, once a play is listed in the cut-rate agency it means that for the seat purchased at the box office for $2.50 the one next to it can be bought at LeBlang's for $1.25. LeBlang also had the privilege of returning tickets he failed to dispose of. The producers of the better class of plays and musical pieces looked on him alternately as a wolf and as a watchdog. If they were making money he was a wolf devouring patrons who would come to them instead of to some other show if only LeBlang's cut-rate had not seduced them. If they were not making money, LeBlang was a life-saver who was engaged in the highly meritorious enterprise of helping them save a little from the wreck. Broadway considered LeBlang to be lined up with the Shuberts as against the Erlanger-Ziegfeld-Dillingham combination.

Then the Uproar Begins

LE BLANG'S scheme, which the Producing Managers Association approved so completely—at first—called for the establishment of a central bureau where tickets supplied by the managers, for every attraction running in New York, could be obtained at the ridiculously low figure of ten cents advance over the box office price. In the face of that kind of competition not only would the hatchet men among the speculators be driven out of business, but also the established agencies which for years had conducted a straightforward business.

Instantly the idea was broached the uproar began. The ticket bureaus living within the law and charging only fifty cents advance over the box office price said the central agency would put them out of business because they would not raise their premium and it was impossible for them to live on a ten-cent-per-ticket margin. But they said it would have no effect on the extortioners who would still be able to get tickets from the theater box offices just the same way and as easily as they do now.

After considerable debate, which included attacks on LeBlang, who was slated to be the manager of the new ticket dispensary, and appeals from the law-abiding agencies to the public to fly to their assistance, the agitation was permitted to slacken a little. Then it was announced that some difference of opinion existed among the producing managers about the amount of the premium to be charged by the central agency. Little by little it was insinuated that the central office could not be run on a ten-cent margin and that the premium would probably be twenty-five cents on each ticket. Through the past summer nothing at all was said on the subject except that "plans were maturing" and that the central office, which was to be a haven of refuge for the public at large, would be operating Labor Day when the season opened. It is long after Labor Day, the central agency has not been opened, will never be opened, and never had a chance from the beginning.

A. L. Erlanger withdrew from the Producing Managers Association because he would not be a party to the plan. F. Ziegfeld, Jr., who from the outset was its most vigorous attacker, preceded Mr. Erlanger to the great outdoors, and Arthur Hammerstein, one of the smaller fry, is the latest producer to leave the Association. The ticket bureau, however, was not the reason of Mr. Hammerstein's exit from the managers association. He did not like the way another producer was elected to membership and resigned.

The real reason the central office plan was doomed is that ticket speculating is in the eyes of the managers a legitimate branch of the show business, it is a source of revenue, and an insurance and despite their protestations they want it to continue. It has been the custom for speculators to buy outright the first twelve weeks of certain new shows and hand the producer a check running into the thousands. Producing stage attractions is always a gamble and the producer who has spent a hundred thousand dollars on a piece welcomed with a sigh of relief the purchase by the speculators of tickets for the first twelve weeks' run. He was thus spared the anxiety of wondering whether he had a success or a failure, the production got well set in the public eye, and he was sure of twelve weeks' solid receipts in his pocket. Under the circumstances it is easy to believe, as Broadway does, that when the ticket brokers saw that there was a chance of the central bureau becoming a fact they passed the word to the producing managers that there would be no more outright buys for new presentations and that the producers became so frightened that they themselves killed the plan. The Ziegfeld attractions never had to use the cut-rate agency and he made no secret of his hatred of it. Erlanger, who is the most aggressive personality among the managers, would not submit to dictation as to how his box offices should be run. So the withdrawal of these two men meant nothing to the success of the central office if it was ever honestly meant to succeed. But it was not.

If producers ever were in earnest about abolishing the ticket speculator the way is easy. Tickets, sold at an advance over the box office price, are, in accordance with the internal revenue regulations, forced to show that fact stamped on the back. Theater managers could refuse to accept tickets bought from speculators and all the doorkeeper would be obliged to do to find out where the ticket came from would be to turn it over and look for the stamp. No elaborate central ticket office, no bookkeeping, no trouble! The only objection to the plan is that it would actually stop the speculation in tickets and theater managers never will let that happen. There is too much in it for them.

The withdrawal of Messrs. Erlanger and Ziegfeld from the Producing Managers Association has one aspect which may result in unexpected eventualities as far as that body is concerned. The agreement between the producers and the Actors Equity Association, which is the dramatic actors' union, has until the summer of 1924 to run. Its renewal is a doubtful matter. The actors union is insisting that there shall be included in the new agreement a stipulation that all players engaged by the members of the Producing Managers Association shall be members of the Equity. To this request the managers have roared a truculent "Never." Their refusal to set up what is euphemistically called by the actors "The Equity Shop," in distinction to the "closed shop" or "union shop" of the common or garden variety of labor union, is based upon nothing stronger than gratitude and the congenital disinclination managers have to letting actors have the last word. For generations actors, to managers, have been "hams." It is doubtful if they will ever be anything else. The successful strike of the Equity in 1918 lifted the player into a position of greater economic security. So far as managers are concerned he is still "a ham."

Equity Scorns "Fidos"

THE element of gratitude arises out of the position of the Fidelity League, an organization financed during the strike by the managers and to which some prominent actors and actresses belong. The Fidelity League abhors the insinuation that an actor is a laborer and squirms at the idea of associating with the horny-handed hod-carrier, and so on. The Equity scorns the Fidelity, nicknames its members "Fidos," and treats it, by and large, as a dangerous enemy. The managers are ashamed to abandon their child, the Fidelity, and they cannot give their shows without the Equity which contains ninety-eight per cent of the capable players in the country. There has been no complaint by the producing managers that they have not been treated with astonishing fairness by the Equity, which evidences a most generous inclination to swallow the Fidelity by giving them gold cards which, while separating them from the lambs of union actors, will yet as goats permit them to earn their living in unionized companies.

Up to the defection of Erlanger and Ziegfeld the managers—publicly at any rate—exhibited a bold front and a loud-voiced determination not to submit to the demands of the union. Everything pointed to another strike. There may be one yet, for the Shuberts, the largest operators of theaters in the country, have scant love for the Equity and might welcome a chance to destroy its influence. Stage hands have recently been given a large increase. Musicians have also received a healthy boost. Those who say they know declare that the wage increases have been given to swing the stage hands and musicians into a position where they will not assist the actors union should a strike be called. It is generally admitted that the walkout of the mechanics and musicians the second week of the 1918 strike saved the day for the actors and that without the support of the two non-acting unions the Equity would be in a desperate position to win.

But all the value of this is diminished by the loss of Erlanger and Ziegfeld. In the meantime three things are apparent. One is that the idea of Mr. Joseph LeBlang regarding the establishment of a bureau which would do away with the evils of ticket speculating is dead and buried. Another is that the public will still continue to be plundered by all the commercial forces connected with the theater. The third is that we may all drop back in our seats and await with what patience we may the release of Episode 500 of the super-comic serial, "Putting the Ticket Speculators Out of Business," by the Producing Managers Association.

Our Dirty Front Doorstep at Ellis Island

British Ambassador Visits Gateway to United States and Makes Startling Report: Can Congress Ignore Conditions?

FOLLOWING are pertinent excerpts from the Report of Sir A. Geddes on conditions under which English, Scotch, Irish and Welsh citizens are received at Ellis Island:

Sir A. Geddes to the Marquess Curzon of Kedleston.
—(Received January 29.)

My Lord, *Washington, January* 18, 1923.

I HAVE the honour to inform you that on the 18th December I received a courteous invitation from Mr. Davis, the Secretary of Labour, to visit Ellis Island. I accepted this invitation, and on the 28th December, 1922, I visited the island and inspected the institutions there . . . . . .

I saw the immigration station thoroughly, and enough of the general hospital to arrive at a fair idea of its state of efficiency. I had time merely to glance at the isolation hospital. I propose to give my impression of these establishments in order . . . . . .

The lavatories, with latrine . . . . . accommodation, open directly out of the sleeping and living rooms. This seems to me to be an inevitably unpleasant arrangement, especially in view of the fact that many, perhaps a majority of the immigrants, are unfamiliar with the pattern of conveniences in use in North America. Some of the immigrants are, I was told by the Secretary of Labour, apt to mistake the sanitary hoppers for drinking troughs, and the floor, or some drainage channel in it, for a latrine pit.

While it is obviously necessary that the drifting crowd of immigrants who have to be handled in the building be prevented from straying and getting lost, I can quite understand that persons of some refinement and intelligence sent to Ellis Island resent the locked doors and wire "cages." These are much in evidence, and inevitably suggest imprisonment. I am satisfied, though, that the work of the immigration station could not be done without them. To unlock the doors and leave them open and to remove the "cages" would produce chaos worse confounded.

Something is now being done to renovate the paint-work and to effect minor repairs. This has been too long delayed, and the buildings have been allowed to fall into a bad state. The roof in parts requires attention. This it is to receive. There can, however, be no doubt that the amount of money expended on upkeep has for years been insufficient, even to maintain the property . . . . . .

Cleanliness must in the circumstances be difficult to achieve. Many of the immigrants are innocent of the most rudimentary understanding of the meaning of the word "clean." I feel sure that a great effort is made to overcome the difficulties this produces. Still, I noticed in many corners impacted greasy dirt that it was possible to say with certainty had been there for many days, if not weeks or months. The impression that I received was that the cleaning is done with long-handled brushes and mops with, at times, aid from a cold-water hose. Nothing but hot water, strong soda and soap freely and frequently applied with a scrubbing-brush will serve if real cleanliness is to be obtained. As a result of the presence of chronic dirt, the buildings are pervaded by a flat, stale smell. This is quite distinct from the pungent odour of unwashed humanity. Both are to be met at Ellis Island. Indeed, the compound smell of old dirt and new immigrants is so nearly universal there that I should not be surprised if it were no longer noticed by the members of the staff. After leaving the island, it took me thirty-six hours to get rid of the aroma, which flavored everything I ate or drank.

Sleeping accommodation for immigrants and detained persons is provided chiefly in two-tiered bunks. These, in most of the sleeping rooms, are arranged in wire cages, the alley-ways being roofed over with stout wire net.

I am sure that it is necessary to encage the bunks to prevent thefts and even more unpleasant outrages. Yet I can understand a certain reaction of annoyed surprise on the part of those whose early experiences were of decent surroundings on being told to go to bed in a cage, even though the cage is necessary and provided for their protection.

The actual surface upon which the immigrant reclines is either woven wire or canvas, supported on metal laths. The canvases that I examined had not been long in use, not more than a few months, but Mr. Tod said that they were not regularly changed or cleaned.

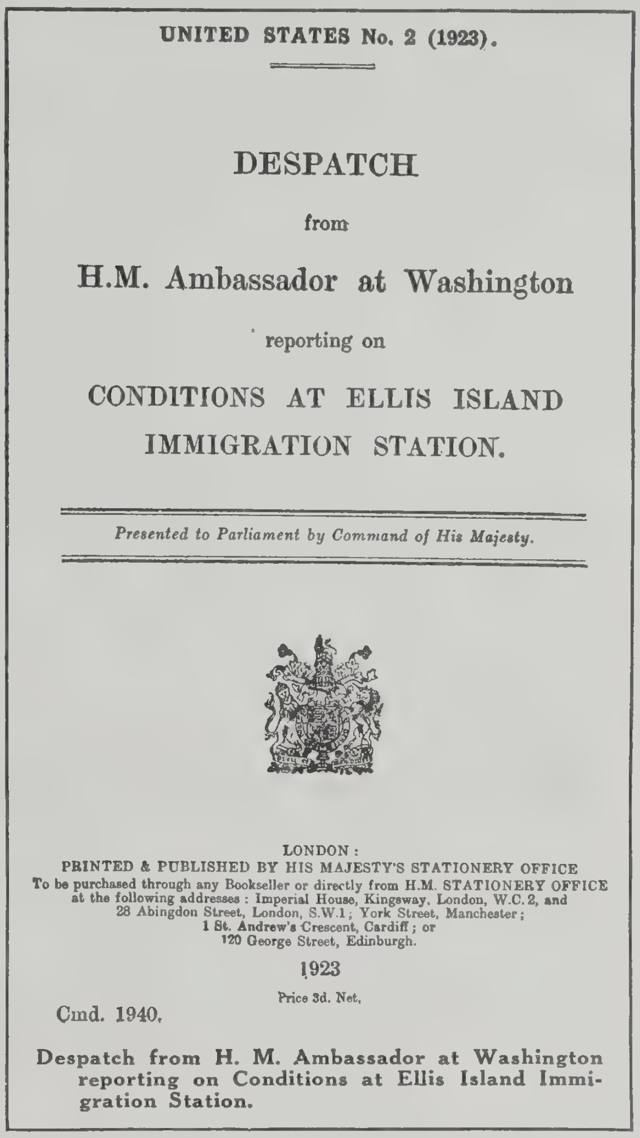
I cannot help thinking that it must be very unpleasant to sleep in the lower of these two-tiered berths, when ill-luck places a brutalised sort of creature in the berth above. The Secretary of Labour informed me that cases have been known . . . . (details at this point in the report are unprintable here).

Five blankets are issued to each immigrant every night. Of these, two are intended to be spread on the wire or canvas and three to be used for cover. These blankets are of satisfactory quality and are sterilised as often as possible. Unfortunately the sterilisation plant cannot deal with all the used blankets every day. As a result, some of the blankets may be used by more than one immigrant between sterilisations. It is not difficult to believe that this may at times produce hardship for the later users.

A cake of soap and two paper towels are also issued each evening to each immigrant detained overnight. The washing accommodation is good, though, of course, there is no privacy. I have heard this complained of. Such a complaint is merely factious. Similarly, some people do not like paper towels. Personally, I prefer them to cotton or linen towels in public washplaces.

The food is of good quality and well cooked. The dining room is the cleanest room in the building, when meals begin. It is impossible, however, for any staff to keep it clean during meals, owing to what may be incorrectly described as the "table manners" of the guests, who incidentally use the floor as a universal slop bowl and refuse can . . . . .

There are special arrangements for the feeding of immigrants of the Jewish faith which, so far as I am able to judge, are satisfactory. I have heard of no complaints with regard to them . . . . .



UNITED STATES No. 2 (1923).

DESPATCH

from

H.M. Ambassador at Washington

reporting on

CONDITIONS AT ELLIS ISLAND
IMMIGRATION STATION.

Presented to Parliament by Command of His Majesty.

LONDON:

120 George Street, Edinburgh.

1923

Price 3d. Net.

Cmd. 1940.

Despatch from H. M. Ambassador at Washington reporting on Conditions at Ellis Island Immigration Station.

The kitchen seemed to me to be well equipped and efficiently managed . . . . . .

. . . . . Those who pass through the immigration station range from the highly educated and gently nurtured, now fallen into straitened circumstances, to the utterly brutalised victim of poverty and oppression in some scarce civilized land. They speak many tongues and dialects. They all, lady, prostitute, mechanic, rabbi, and what-not, are frightened, nervous, shy and strange to their surroundings. They are quite ignorant, too, of what is expected of them and have no conception of what is going to happen next, or why anything happens. Anxious and worried old men and women, young men, girls and little children drift about rooms into which they have been put, or crowd round doors which they think may open. The units in this heterogeneous mass of humanity obviously dislike some of their contacts with one another and yet like sheep follow where any leads. Like sheep, too, they have to be herded and, by hurdles, kept from straying.

It really is remarkable to see how well the miserable mobs of nervous human beings, with all their worldly goods, are manœuvred through the legally necessary examinations and are despatched to their destinations. The officials certainly deserve credit for what they do achieve. Still, detention on Ellis Island must be a hateful experience for all of any sensibility who pass its portals.

When a barge-load of immigrants arrives at the island wharf, the crowded people pass on shore and are quickly scrutinised for signs of infectious disease. If a child has developed measles, let us say, he is picked out for treatment in the isolation hospital. The mother passes on with the crowd. Her feelings may be imagined.

The crowd files into the waiting rooms. These are caged with heavy wire net. It is necessary that they should be to prevent individuals straying. Still, the mental effect cannot be added happiness. From the waiting room the men and women are called out in batches, male and female, for examination by the medical officers. It is obviously impossible precisely to synchronise the calling out of the males and females of the same party. Not understanding what is happening, strange and nervous, some of the wretched immigrants believe that they are being separated from their friends for ever. The Commissioner of Immigration told me that this calling of a man into one room and his wife into another, even though they are only to be separated for a few minutes, leads in some cases to pathetic scenes.

However, they are at length shepherded to the appropriate room. There an unpleasant experience awaits them. The rooms were not designed to provide facilities for the sort of medical examination now required by law. The arrangements are makeshift. During the years that I was Director of Recruiting and Minister of National Service I saw many medical boards in Great Britain. Until the whole recruiting medical service had been reformed by Sir James Galloway, many of them were very far from perfect. Still, no recruiting medical board that I saw was quite so badly accommodated as the medical inspection board I saw at work at Ellis Island. No separate dressing rooms or cubicles are provided. The men strip to their trousers in a crowd jammed between coat-racks. They have to pile their things on the racks higgledly-piggledy—the clean clothes of the washed on the foul clothes of the unwashed. Personally, I thought it disgusting for the washed.

. . . . . . The doctor wore rubber gloves. I saw him "do" nine or ten men. His gloves were not cleansed between cases. I saw one nice, clean-looking Irish boy examined immediately after a very unpleasant-looking individual who, I understood, came from some Eastern European district. I saw the boy shudder. I did not wonder. The doctor's rubber gloves were with hardly a second's interval in contact with (him) after having been soiled, in the surgical sense at least, by contact with those of the unpleasant-looking individual.

The examination of the heart and lungs, &c., of the male immigrants seemed to be effectively and expertly made.

* * *

Those that are granted entry, the vast majority of all immigrants, are now done with Ellis Island and at once get away to New York, or, if they are going west, pass to the railway booking hall, where they exchange their vouchers for rail tickets, are told when they will start and how they will be taken to the railway station. Their baggage is skillfully and expeditiously handled. They can purchase at surprisingly low cost most excellent food for the journey and then they, too, get away, done with Ellis Island for ever. All the arrangements for handling admitted immigrants are efficient and reflect high credit on those concerned. They are, in fact, a very good example of American business administration . . . .

I feel profoundly sorry for some of the temporarily detained—a mother waiting for a delayed child, or a father with his children anxiously watching for his wife to come to him. The very heart of the tragedy of Ellis Island is in the room of the temporarily detained. It is no one's fault and cannot be avoided, unless immigrants to the United States are to be finally approved for admission in their own land before they set out upon their journey.

Large numbers of the immigrants have to go before a board to determine whether or not they may be admitted. I saw five or six of these boards at work. The proceedings were decorous and seemly; the arrangements for witnesses who come to speak for or against the admission of an immigrant are good. Every immigrant rejected by a board is told of his right to appeal to the Secretary of Labour in Washington.

This arrangement, the theory of which is probably right, is in practice nothing short of diabolic. For days some wretched creature is kept in suspense. The appeal board at Washington, which advises the Secretary of Labour, works on paper records, tempered, I have heard it said, by political pressure. The Secretary of Labour may be busy, overwhelmed, perhaps, with work in connection with some labor dispute, or anything. Days slip by, into weeks sometimes, before a decision is reached. When the doubt affects one member of a family, perhaps a child, the mental anguish must be excruciating. The system is to blame. In my judgment there can be no question that power to decide should be delegated by law to someone on the spot with the facts and the people before him. If the United States Government will expedite the decision of appeals so that the results can be announced within twenty-four hours of the completed collection of the facts, the anguish of Ellis Island will be appreciably reduced . . . . . .

As a matter of fact, what Ellis Island needs, in my judgment, is to be relieved of the presence of about one-half of the people who are poured into it. If a deportation station were established somewhere else with suitable buildings and reasonably extensive grounds much would be gained, but there certainly ought to be

(Concluded on page 14)

The True Story of Mexico's Hapsburg Emperor

Concluded from page 7

England, Belgium, and with the direct support of the third Napoleon, Ferdinand Maximilian I, became emperor of Mexico, "to replace," as the French stated his purpose, "the tyranny of Juarez with an empire." In August, 1863, the imperial forces, approximately 40,000 in number, a considerable army for the New World at that time, surrounded Mexico City, and extended from that historic capital along the trails for 240 miles eastward to Vera Cruz, occupying more than sixty cities, towns, villages and hamlets on the way. It formed an armed and armored pathway for Maximilian and his royal bride from the Port of the True Cross to the city where an Irishman, Jack O'Donohue, had once ruled as the last viceroy of old Spain in the New World.

At first, General Bazaine, the French commander, inflicted defeat after defeat on the Mexican arms; then, suddenly, the young commander, Diaz, turned on him and, from his native state of Oaxaca, slowly drove the imperialists northward. In 1864 and 1865 the news went to Napoleon that the United States was once more in a position to enforce the Monroe Doctrine; that the American press was demanding that enforcement; that American troops were being massed on the Mexican frontier, and that the attitude of the Washington Government toward France was becoming critical. Then, suddenly and without warning, Bonaparte announced the withdrawal of the French troops from Mexico, to take place at the beginning of the year 1867.

Though he had been so instructed when he left Europe, Maximilian, a man of peace, a student, and one who hoped by strict justice to accomplish in Mexico what he had previously accomplished with the Italians when he was governor-general of the Lombardo-Venetian kingdom, had neglected to organize and maintain a native army. It has been ever the history of all the Latin-American republics that the man of high principles who attains high office is lost, and it was so with Maximilian. After Carlota's plea to Napoleon had proved vain, Maximilian placed himself at the head of such an army as he could muster following the withdrawal of the French troops. With these men, numbering all told only 1,600, and with twelve small pieces of artillery, the student who would be emperor set out from Mexico City, and, on February 19, 1867, reached Queretaro, some 120 miles northwest of the Mexican capital, where a force of imperialists awaited him.

Maximilian gave up his studies and his plans for the development of Mexico, and devoted all his attention to his soldiers. He personally directed every detail of the distribution of food and clothing and literally lived with his army. On March 5, General Escobedo, supported by Generals Treviño, Regules, Corona and Riva Palacio, leading the Juarist army, surrounded Queretaro. In a short time the army of the defenders was reduced to less than 5,000 men, though in the heaviest attack the Juarists were defeated with a loss of more than 2,000 men. Following this disaster, the radicals converted the assault into a siege, and sat down to wait for hunger and thirst to deliver the emperor and his followers into their hands.

By the fourteenth of May, the garrison had become so reduced that it was determined by Maximilian and his generals to attempt to break through the investing lines and gain the Sierra Gorda, a series of mountain ranges inhabited by Indians who were the followers of General Mejia. In every hour of trial, however, a Judas seems to arise, and one appeared here, in the person of Miguel Lopez, a colonel in the Empress Dragoons, the 600 Frenchmen who, sworn to defend the Empress Carlota, and known as her own regiment, had refused to desert their emperor. On the night of May 14, the night before the day on which the sally for the mountains was to have been made, Lopez, believing the cause of the emperor to be lost and determining to find a safe place for himself before the crash came, went secretly to Escobedo's headquarters, and in return for immunity, a position in the Juarez army, and a sum reported in Escobedo's journals as 10,000 pesos—or about $5,000—revealed the plans for flight laid by Maximilian and his followers, and agreed to deliver them and the city of Queretaro to the enemy.

Lopez, who was in charge of the reserve, stationed in the Convent of the Cross, a massive stone building in the heart of the city, removed his troops and admitted the forces of Escobedo to possession of the convent, under cover of darkness. These troops, according to the records, were under command of General Velez, who, rather oddly, does not appear again, so far as the writer can find, in Mexican history. Who he was, whence he came, and whither he went, seem to be mysteries. By daybreak of May 15, the city was in the hands of the Juarists, and Lopez, who had pretended to have provided a means of escape for Maximilian, led the fallen emperor to the Cerro de la Campaña, a low hill, where, with Mejia and Miramon—who, it appears, did not yet suspect Lopez—the Austrian archduke continued to plan such defense as could be made with the few French troops, who yet remained uncaptured. Lopez is reported to have entreated Maximilian to hide, but the latter answered:

"I, who have committed no crime, do not hide, but would that some friendly bullet might find me."

Looking down on the ranks of the Juarists rapidly filling the city, Maximilian said to Mejia and to Miramon:

"Let us cut our way out to the mountains."

"Sire, it is useless to attempt it," replied Mejia, and Miramon nodded his head in approval, "but, if Your Majesty orders it, it can be tried."

Then Maximilian ordered the raising of the white flag. Escobedo received the sword of the emperor, and immediately thrust Maximilian, Mejia and Miramon into bare rooms in the Capuchin convent. Though Maximilian, unknown even to Carlota, had sent his abdication to Juarez prior to his leaving Mexico City, the revolutionary leader refused to recognize it, and ordered the immediate trial of "this upstart emperor and his two so-called generals, Mejia and Miramon." Juarez has been called a patriot, and the father of Mexican independence, while costly monuments have been erected to his memory in virtually every city in the southern republic, yet, in this case as in scores of others, he merely proved himself a murderer and an assassin of the helpless who fell into his hands. As a matter of fact, every battle won for the cause of Juarez was fought and won by men like Diaz and Escobedo, the latter of whom did as much as he could to save Maximilian, and the former of whom pardoned, without reference to Juarez, scores of leaders of the opposition whom he had captured.

Be that as it may, the trial of Maximilian, Mejia and Miramon opened on June 13, in the Iturbide Theater, Queretaro.

With a court-martial picked by Juarez from the lowest rank of officers permitted to sit on such a tribunal, and with these men instructed by Juarez, as it has been proved they were instructed, to find Maximilian, Mejia and Miramon guilty, regardless of the evidence, they were found guilty and sentenced to death within three hours.

Maximilian and his companions, therefore, prepared for death at daybreak of the sixteenth of June, but they were notified that a reprieve had been granted until the nineteenth. The reason for this reprieve never has been ascertained, but it is supposed that it was a sop thrown by Juarez to his generals who had protested the murder of the three captives. When the reprieve was brought to him, Maximilian exclaimed:

"That is unfortunate, for I am fully prepared to leave this world."

On the morning of the day fixed for the execution, the three men were driven in carriages to the Cerro de la Campaña, where they walked arm in arm to the high wall of adobe bricks. Finding himself in the center of the group, Maximilian turned to Miramon, who stood on his right, and said:

"A sovereign always respects a brave soldier. Allow me to yield to you this last place of honor."

And he gently guided the faithful old general to the center, and took his own position on the right. Then, speaking to Mejia, who had been with him since the landing of the imperial party at Vera Cruz, four years before, the deposed emperor said:

"What a splendid day is this; I always have wanted death to come to me on such a day. Be assured, my general and my friend, that what I have been unable to reward in you on earth, will be compensated for in heaven."

He then distributed all the money that he had among the soldiers, a squad of five ragged, sandal-shod Indians, and said, as he stepped back to the wall:

"May this blood of mine be the last shed in sacrifice for this country, but, if more is required, may it be for the good of the nation, and never because of any act of treason."

As he died, the priest who had served him through his imprisonment and up to the moment of his death heard Maximilian murmur the one word, "hombre" (man).

By some unexplained influence, the savage Juarez was persuaded to allow the body of Maximilian to be shipped back to Austria on the same ship that had brought him and the beautiful Carlota to Mexico a short four years before. "He had requested," says one historian, "that his remains be laid side by side with those of his beloved Carlota, whom he believed to have preceded him into the other world, but the princess, deprived of her reason by the duplicity of Napoleon and the brutal cruelty of Juarez, still lived her living death."

And so she still lives it, the most tragic figure in all New World history, the Empress Carlota, who, on the twenty-third day of June, this year, almost exactly fifty-six years after the execution of her husband, "celebrated" the eighty-third anniversary of her birth. It is believed that she knows absolutely nothing of anything that has occurred in the world outside the grounds of the Castle Bouchout since the news of her husband's death was brought to her in Brussels, half a century and more ago.

Our Dirty Front Doorstep at Ellis Island

Concluded from page 13

increased accommodation for immigrants. Before seeing Ellis Island I had imagined that segregation by nationalities might be possible. I am now satisfied that it is not. The flow of immigrants from each nation is too irregular to permit of any satisfactory system of national segregation being devised, and yet some division of the immigrant stream seems to me essential if Ellis Island is not to be abandoned and a new and larger station built elsewhere. After considering the matter with some care, I have come to think that it might be feasible to divide the stream into its Jewish and non-Jewish parts. Persons of the Jewish faith require special food and special utensils, and their being mixed with Christians on the island undoubtedly creates considerable administrative difficulty.

Whether the Jews should be sent to Ellis Island or to a new station seems to me to be a matter of no importance . . . . . To divide the stream on the basis of its food requirements seems to me administratively feasible. In the dining rooms that division has to be made in any event. I am well aware that all proposals to separate human beings on a basis of religious belief are certain to meet with opposition, and that failures to meet special religious requirements, as in the case of food, are equally certain to meet with opposition.

I believe that the choice of the United States Government is by circumstances limited to three possibilities: (1) To continue Ellis Island as at present, with such minor improvements as are possible; (2) to build a relief station and to supply at it, or at Ellis Island, but not at both, food prepared in accordance with the Jewish ritual and to send all immigrant Jews to that station and all non-Jews to the other; or (3) to abandon Ellis Island and build a completely new station somewhere else in New York Harbour or on its shores . . . . .

On the whole, I thought the hospital arrangements good. I inspected the laundry, which I found to be efficient . . . . .

After seeing Ellis Island and studying its problems, I believe that it is true to say that it is impossible to administer any immigration station under existing United States laws without hardship and tragedy. If a system could be devised which would prohibit persons desiring to come to the United States from sailing from Europe or elsewhere without the certainty of admission to the United States, the problem would be almost entirely solved. . . . .

At present United States consuls, when granting a visa to passports to the United States, may mark the visa with the number of the regulation which they believe that individuals entering the United States would violate. Not only so, United States consuls abroad send communications through the mails to the Commissioners of Immigration saying that they have issued passports to such-and-such persons who are sailing on a particular boat on a specified day, and that, in the judgment of the United States consul, they should not be allowed to land. I feel quite sure that this does not unfairly bias the judgment of the immigration authority, but, if an individual is clearly not eligible to enter the United States, it would, in my judgment, be kinder to prevent him sailing from Europe or elsewhere than to let him reach Ellis Island and there turn him back . . . .

In conclusion, I noticed a desire upon the part of officials to say that Ellis Island is as good as any immigration station in any land. It may be. Still, it is quite certain that no other nation's principal immigration station has the same problem to solve, for the reason that the laws of the United States are not the same as those of any other nation.

I have, &c.
A. C. GEDDES.

P.S.—I have handed copies of this despatch to the Secretary of Labour, Mr. Davis, and to the Commissioner of Immigration at the Port of New York, Mr. Tod.

A. C. G.

Too Many Banks, or Soon Will Be, Say Bankers

Concluded from page 6

'offices.' Both of these last two plans are indirect ways of doing what the bank believes to be right, but they are apparent evasions of the possible intent of the law, and if they are right the law should be so changed as to make the bank's right clear and unequivocal and to establish the proper restrictions and limitations.

"Fifth, it can endeavor to deprive a state bank of its unfair power. This, however, is practically impossible. Branch banking is permitted in seventeen states, prohibited in sixteen, and in the other fifteen and in the District of Columbia there is no specific provision on the subject."

Mr. Newcomer denied that the big banks sought a monopoly of banking and wanted to drive out the small banks, alleging also that they would not have the power even if they were so minded.

That bank competition is inevitably costly need not be doubted when banks pay from half a million to five million dollars for privileged corner space in the most popular parts of the city. It is not only the question of real estate; it is the upkeep. In New York City, especially, it has become an even bet as to which of three organizations shall get the available corners—tobacco stores, corner chain groceries or banks!

On the side of the banks this must be said for them—that partly the cause for this blind and even insensate race is due to the waves of banditry which cause so much trouble from time to time. One bank went so far as to plan to call for deposits at one's place of business and likewise bring cash for checks, but this was found as not within the law, which provides that banking business must be done in the banking premises at the legal address.

Perhaps it may come to pass that branch banks will be planted in the future equidistantly and alternately by the various parent organizations, instead of, as is now the case, in clusters at certain points, with no banks between. Yet one may well doubt if communities require as many banks as they do groceries and drug stores.

On the eve of the forty-ninth convention of the American Bankers Association a banker suggested to me that the governments—Federal and state—may yet be forced to limit the number of banks in the future, just as once they limited the number of cafés. He opined that the limitation should be on the basis of assessed valuation of each community, but that would be a very vague and unreliable plan. If anything, banks should be limited either in accordance with the amount of taxes annually paid or, what's safer, by population units.

At the rate banks are increasing, otherwise, it will soon be impossible to determine who has what, when, where and how much. It's ninety per cent bookkeeping!

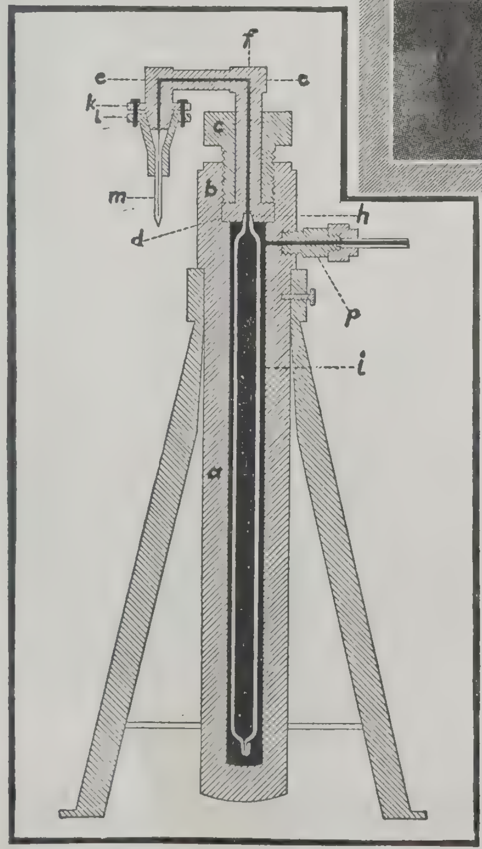
President, Ramsey Institute of Technology, St. Paul, Minnesota.

Life Near the Absolute Zero of Temperature

MODERN physical science endeavors to explain all physical phenomena in terms of motion. No matter how complex a phenomenon may be, when the physicist is through with his investigation, the final statement deals with elementary portions of matter performing, as it were, on the stage of space and time. Just as the music of Grieg, in Peer Gynt's Suite, conjures before our eyes the vision of prancing and dancing goblins (*troll*) so modern science pictures matter to us as composed of *molecules, atoms, electrons* and little *monons* of primordial matter in constant rhythmic motion. The cosmic symphony is composed of gyrations, pulsations, rotations, translations, and vibrations. The microcosmic world of atoms as well as the macrocosmic universe of planets exemplify the Creative Reason in terms of those organized movements which science knows as the laws of nature. Heraclitus, the Greek philosopher, expressed the idea of this "continual flux" by saying, "You cannot step twice into the same rivers, for fresh waters are ever flowing in upon you."

The statement of Heraclitus may cause us to ask the questions: Will this motion never cease? Is the dance of the electrons unending? Does the curtain ever fall on the drama of matter? Whatever our scientists may say, by way of answers to these questions, I prefer to quote the East Indian proverb which truly states that "God knows better."

Science, however, believes that it has found an ever-narrowing road which finally converges to nil at the so-called *absolute zero of temperature.* At this point all molecular motion is supposed to cease. The *absolute zero of temperature,* as calculated by Lord Kelvin, is -273.7° Celsius (Centigrade). The usual value given is -273° Celsius or -459.4° Fahrenheit. It is an interesting fact that Fahrenheit set the freezing point of water at 32° in his scale of temperatures, because he believed that his 0° represented the *absolute zero.* Temperatures within 13° Celsius of the absolute zero have been produced. This extraordinary accomplishment was the crowning achievement of Sir James Dewar, the illustrious English scientist, who died on March 27, 1923, at the Royal Institution. Dewar produced this law temperature (-260°C.) in the year 1899 when he solidified the gas hydrogen. In the year 1883, the two Polish scientists, Wroblewski and Olsyewski, liquefied oxygen, air, nitrogen, and carbon monoxide. In 1891, Olsyewski succeeded in liquefying hydrogen and determining its boiling point at —243.5° Celsius.



Gas compressor used by the Polish scientists, Wroblewski and Olsyewski in the liquefaction of oxygen, air, nitrogen and carbon monoxide.

If the life of a molecule and an atom consists in motion then the cessation of motion is equivalent to the death of matter. Science predicts that this death will occur at —273° Celsius. If that contention is true then it is certain that Wroblewski, Olsyewski, and Dewar have brought matter very near to the point of death.

Since it is the writer's purpose in his *Science Briefs* to present such pertinent criticism of scientific hypotheses as may have been inadvertently or deliberately ignored, mention must here be made of the significant criticism of Frederick Hovenden concerning the alleged relations between heat, temperature and molecular motion. In his great work, "What Is Heat?" Hovenden cites J. Clerk Maxwell as follows: "The molecules of all bodies are in a state of continual agitation. The hotter a body is the more violently are its molecules agitated." Hovenden then points out that, according to prevalent scientific notions, violently agitated molecules must travel through longer distances with a resulting increase in volume. According to present scientific opinion this result also explains *temperature.* Hovenden, after stating the case for the physicist, offers the following pertinent criticism:

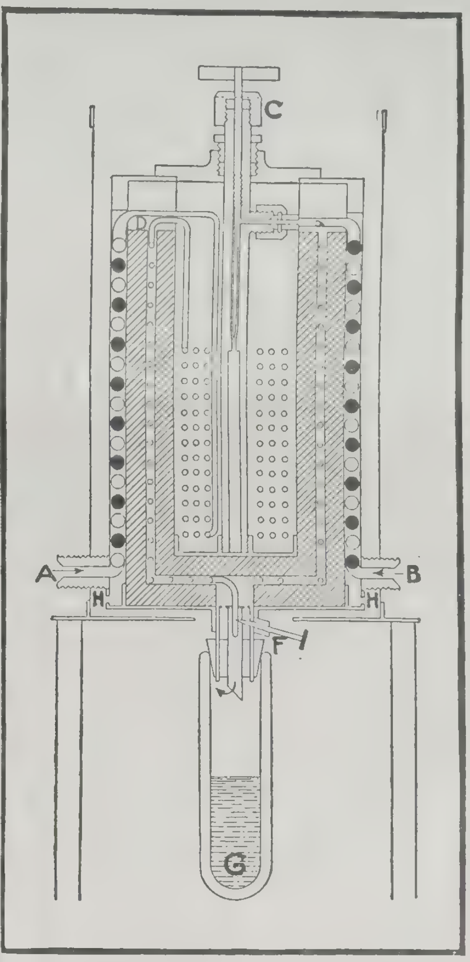
SIR JAMES DEWAR

Whose death on March 27, 1923, means a great loss to science. His heroic attempts to approach the absolute zero of temperature stand forth as imperishable monuments in the annals of English science.

"When water is transformed into the gaseous form by the electric current, one cubic inch of water is increased to 1,800 cubic inches of gas. According to modern science the gas should register a much higher temperature than the water from which it was produced because the motion of the gas particles is much greater than that of the water particles." The fact is, however, as Hovenden states, that *"The temperature of the gases is exactly the same as that of the water as measured by the thermometer!*—proving there is no more motion in the gas than there is in the water, so the theory cannot be true."

Hovenden cites one case after another where the modern theory of heat utterly fails to conform with experimental facts. From his critical observations Hovenden concludes that heat is something more than a condition of atomic or molecular bombardment. With prophetic vision, in the year 1900, before the atomic theory of the new science had assumed fairly definite form, he announced the variability in the size of the atom. Today modern science is being forced to adopt this view, but Hovenden is forgotten. In the year 1902 the writer had become convinced that Hovenden was correct in his theory that the atom is not fixed in its dimensions and this view was, consequently, incorporated in a paper entitled "The Interdependence of Atomic Weights and Electrochemical Equivalents," read before the American Electrochemical Society, at Cambridge, Massachusetts, April 26, 1905. Hovenden further conceived that an influx of what he terms the *fluid ether* is the cause of the expansion of the atom and that this is equivalent to an influx of heat which may be observed as a rise in temperature. Similarly an efflux of *fluid ether* from the atom is equivalent to the production of cold and its accompanying reduction in temperature. The writer's view of this phenomenon is similar to that of Hovenden with the exception that he prefers, on experimental grounds, to regard the change in atomic size as being due to an influx and efflux of energy operating in conformity with the laws of his *Space-Time Potential.* It is with regret, however, that we must admit that the work of Hovenden has not received the recognition that its importance merits.



The self-intensification of refrigeration apparatus used by Sir James Dewar in the liquefaction of oxygen, air, and so on, on a large scale.

What about Life itself at the low temperatures produced by Sir James Dewar?—can this unique principle survive near the absolute zero of temperature? The startling experiments of Dewar and Macfayden prove that intense cold does not destroy the life principle. The most marvelous of these experiments were performed upon phosphorescent organisms whose light is produced by chemical processes which cease when the organism dies. Under the influence of the low temperatures of liquid air their luminosity disappeared only to return as soon as the temperature was raised sufficiently. The result was the same when these luminous organisms were exposed to liquid hydrogen at a temperature of only 28° Celsius above the absolute zero.

These astounding investigations cause us seriously to meditate and wonder if life, after all, is not far more than mere chemical reactions. Again we are "In the Shadow of Immortality" for on the threshold of material death, life still persists.

URBANA ILL

BRIEFLY TOLD

The Chinese are protesting against the impractical character of the education given the young Chinamen studying in America at the expense of the Boxer indemnity. They return to China with "nothing more than a store of book learning and a superficial knowledge of American life to show for their long sojourn at government charge in the United States." China needs men who are willing to work—not aspirants for government jobs.

Automatic telephone exchanges are about to be adopted in London.

Six thousand, five hundred forty-seven decrees for divorce were granted in Cook County, Illinois, in 1922. In Chicago a divorce is granted every twelve and a half minutes for five and a half days a week and twenty-five days a month for the ten months the courts are in operation.

A proposed list of those who are to be awarded the Nobel peace prize include the following names: Jane Addams, Secretary Hughes, Lord Robert Cecil, Professor John Maynard Keynes (author of The Economic Consequences of the Peace), Francisco Nitti, Carl Lindhagen (Mayor of Stockholm), Warren G. Harding. There is no rule against post-mortem award of the prize.

More than eighty per cent of the population of Brazil cannot read or write.

The origin of the term "Wobbly," so often applied to members of the I. W. W., is given as follows: In Vancouver, British Columbia, in 1911, the I. W. W. had a number of Chinese members, and one Chinese restaurant keeper would trust any member for meals. He could not pronounce the letter "w," but called it "wobble," and would ask: "You I. Wobble Wobble?" and when the card was shown credit was unlimited.

Every boy and girl who is a member of the purebred sheep club of Big Horn, Wyoming, sleeps under a blanket made of wool from his or her own sheep.

James J. Davis, Secretary of Labor, believes the United States should have the same right to investigate the character and qualities of prospective immigrants as it has to judge of the acceptability of members of the consular or diplomatic service assigned by foreign governments to the United States. He would admit as immigrants not merely men who are able to do a day's work, but men who have sufficient character and background to build up the very best kind of American citizenship.

Charles Edward Jefferson has been a preacher on Broadway for twenty-five years. His church is the famous Broadway Tabernacle. He says, "It is a long time. No actor or singer stays twenty-five years on Broadway. Few restaurateurs or business men remain there so long."

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

Recently two French soldiers were bathing in the Rhine River. Since they were unable to swim, the soldiers were in a serious condition. A young German, who was watching, swam out and rescued both of them. The French Tribunal, to reward him, promised that anything he asked would be granted. He asked that the lives of seven men, who had been condemned to be shot for causing trouble to the French authorities, might be spared. The request was granted.

In Germany stocks gain 30,000,000 points in a single day.

The mechanical eye of the aviator's camera is adding materially to our knowledge of prehistoric man. Primitive disturbances of the soil may have disappeared so completely as to leave no trace whatever on the surface, and yet are plainly visible from airship. The so-called "Avenue," leading from the famous monuments of Stonehenge, near Salisbury, England, has now been traced as far as the River Avon by means of aerial photographs and later verifications made by pedestrians. It is now believed that the stones were taken from the Prescelly Hills in Pembrokeshire and brought by sea up the river Avon to a point near Stonehenge where they were taken overland to Stonehenge by means of a newly discovered avenue which follows the gentlest slopes up from the river.

An unusually prolific variety of cotton has been developed by Mr. P. Dan George, of Lamarque, Texas. Mr. George has grafted the regular cotton plant to the root of the mulberry tree, and a cotton tree growing eight to twelve feet high has been produced. The tree is now two and one-half years old and is growing rapidly. It has borne its second crop of cotton and has more than 900 bolls on it.

The Congress of Orthodox Jews at Vienna has adopted a resolution requesting President Coolidge to relax the conditions imposed upon Jewish immigration by the United States.

The Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employes, whose membership six years ago totaled less than 5,000, on Labor Day dedicated a handsome new building, located in Cincinnati, which will house its headquarters and its own bank. The bank will be operated on the co-operative plan. Stockholders are restricted to dividends of ten per cent, and profits in excess of ten per cent are divided among depositors. Before the clerical employes of the railroads were organized it is well known that they were the most subservient, the most imposed upon, the poorest paid among the great army of men and women who transport the nation's commerce. Today they enjoy that independence which makes men better citizens and better workmen.

An increase in arrests for pocket-picking during the period when the recent partial eclipse of the sun was visible in New York City was reported by police of that city.

A smooth, unbroken highway now stretches from Vancouver to Los Angeles, linking two nations and joining three states to Canada. The last of the cement completing the highway from Vancouver to the border town of Cloverdale, British Columbia, was poured in the presence of thousands of motorists who met there to attend the opening ceremony.

H. E. Benito Mussolini, prime minister of Italy, in a recent interview, said: "No nation can call itself well organized and prosperous which has within its borders any large number of people who are insufficiently provided with the necessities of life. There is nothing the matter with the logic of socialism or communism; but life does not fit in with that logic, and look at what disaster has been brought about in Russia by blindly insisting upon a logic that does not fit life! We live in a world of people."

The call S O S, used by ships at sea as a distress call, is purely arbitrary in its grouping of letters and was chosen because of the unusual combination of dots and dashes which make it distinctive above all other calls. It consists of three dots, space, three dashes, space and three more dots.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

CHRONICLER OF THE NEGLECTED TRUTH

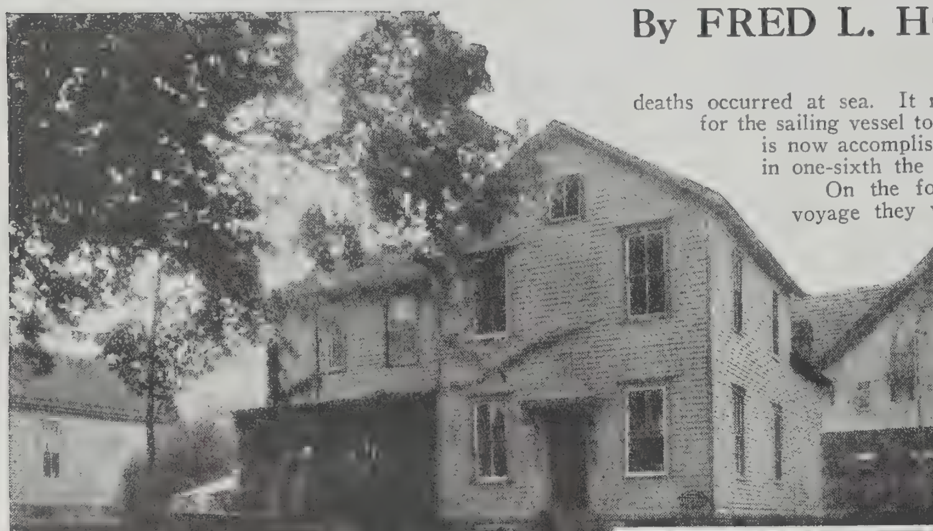
Swiss Colony Center of U. S. Cheese Industry

Transplanted From Alps, Farmers Make Wisconsin County Highly Productive

By FRED L. HOLMES



In this building during the winter of 1890-91 were held the first dairy school classes in America. From this humble beginning the big Wisconsin dairy school has developed at Madison.

A COLONY of Swiss transplanted from their homes in the mighty Alps to the rugged hills and valleys of Green County, in Southern Wisconsin, three-quarters of a century ago, has transformed that community into one of the richest, if not the most prosperous, dairy sections in the nation.

Former Secretary of Agriculture, E. T. Meredith, in a special bulletin, has cited Green County as a national example of dairying success. Backing this announcement with statistical data, he placed the record of this community before the nation as an achievement for other dairy sections to emulate.

Interwoven with this record of prosperity, attained as the center of the Swiss cheese industry of the United States, is a historical background more romantic than the founding of many of the pioneer colonies in the New World. Back in 1845, the canton of Glarus, in Switzerland, became so over-populated that food was scarce and a public meeting was held to lay plans for relieving the economic pressure by sending some of the members to seek a new home in the United States. Two agents were dispatched to look for suitable lands, which in topography would resemble the mountainous scenery of the native land.

On a rainy day in April, 1845, the men, women and children gathered on the banks of the Linth Canal to begin the long journey. There were nearly two hundred persons and arrangements had been made for only one hundred forty. Two leaders and two spokesmen were chosen and the colonists pledged them their implicit obedience. Hardships were experienced from the start. Packed closely in an open vessel, a pelting rain followed by a blinding snowstorm added to the discomfort of overcrowding. The vessel was so small and the passengers were so many that no room remained for lying down. After much distress Zurich was reached, and there the women and children were transferred to covered wagons.

"We arrived at Basle on the eighteenth," says the journal of Mathias Duerst. "The cold rain was falling in streams, and the utter wretchedness and discomfort were enough to chill the ardor of the strongest among the wet, shivering men. The wagons containing our wives and children arrived about the same time, and although they had been packed in like a lot of goods, we were glad that they had not been exposed to the cold and wet as we had been."

Distress marked the remainder of the journey. Many of the colonists were compelled to sleep on bare boards on the vessel's deck during the trip down the Rhine. On the way from Rotterdam to New Dieppe they encountered a terrible storm and at each stopping place they were compelled to skirmish for provisions. While awaiting the arrival of an ocean vessel at the latter place they camped on the shore in the manner of gypsies.

Finally they embarked on the trip across the ocean. There was much suffering from hunger; and there were misery and distress among the weaker members. Two deaths occurred at sea. It required forty-six days for the sailing vessel to make the voyage which is now accomplished by a luxurious liner in one-sixth the time.

On the forty-ninth day of their voyage they were landed at Baltimore. They stopped long enough to hold an indignation meeting; to condemn the crowded condition and treatment they received on the trip. After that they set out for St. Louis.

"Then we experienced the greatest pleasure of our lives," continues the diary of Mr. Duerst. "None of us had ever before rode on a railroad. The train took us to the Susquehanna River at Columbia, where we left the cars and loaded our baggage and persons on canal boats, which were to carry us to Pittsburgh. We were packed in, like a herd of sheep. Many could not even sit, but had to stand up the whole night."

There was keen disappointment for the colonists when they arrived in St. Louis. It was here that the two messengers dispatched by the Swiss Government to select the lands for the colonists were to meet them. And there were no tidings. Two members were dispatched by the colonists in search of them. These emissaries roamed over the prairies of Illinois and finally into Wisconsin. By chance the prospectors were located. Meantime the colonists had grown weary of their life in two rented cottages at St. Louis and set out for Galena, then the head of immigration for the mining section. On the day of their arrival in Galena, which was later to attain national fame as the old home of General U. S. Grant, the leaders met them.

On the fringe of the lead-mining section in Southwestern Wisconsin, tracts of land had been selected as the new home. After their old canton home it was named New Glarus. Here the colonists arrived on August 15, 1845, with the pots and kettles they had carried from their Old World home. Rude huts thatched with hay were built, but it was Christmas Day before the entire colony was housed. Rules and regulations were adopted by them for their government, some of them being unique:

"Everyone is obliged to take the land which he draws by lot, and whether it is better or worse, to accept the same without protest.

"The main street from east to west shall be thirty feet wide, but the other streets shall be only fourteen feet wide.

"All creeks, springs and streams, shall be the common property of all lot owners.

"The colonists shall be obliged to assist each other in building houses and barns.

"Should mineral, be found, then the lots on which it is found shall revert to the society, and the owner shall receive therefor appropriate compensation."

The cantonal authorities in Switzerland bought the land for the colonists. Although all organic relation with the home colony ceased long ago, the colony remained for many years essentially Swiss, speaking the German-Swiss dialect, yodeling the Swiss songs and maintaining the customs of the motherland. The success of the settlers of New Glarus resulted in emigration of more of their countrymen to Wisconsin so that the neighboring townships of Washington, York, Monroe, Mount Pleasant and Sylvester in Green County are all settled by these frugal industrious peoples.

Approaching the village of New Glarus today by cement trunk-line highways, one sees large signboards which briefly relate the history of the colony. The Swiss are proud of their progress.

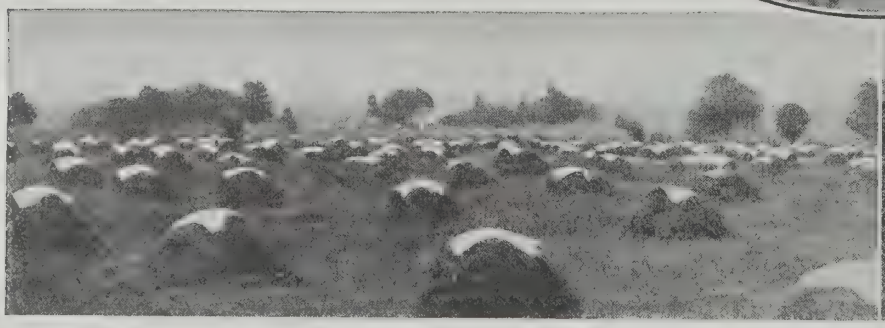
But no one who has heard of the colony need be told when it is reached. The comparison between Swiss farming and that of ordinary Americans is as distinct as the color line in the South. Large red barns, with two or three silos, modern farm homes—some brick, others stucco, but all well painted—that would do credit to any city, is the rule. The landscape is undulating and along the hillsides sleek herds of cattle are grazing. Truckloads of milk rumble over the highways and fields, and fence corners are free from weeds.

In the gloaming over the pasture lots is heard the tinkle of cowbells as the lowing herds wind slowly to the milking barns. Now and then is heard the yodel of some Swiss melody, for the young farmer lads have kept up the singing customs of their ancestors.

All this peace, contentment and prosperity has come as the result of toil and many hardships. For more than twenty years after the coming of the colonists to New Glarus they raised wheat. Untrained in American agriculture, they soon had their lands depleted, and they

(*Concluded on page 14*)

Above—In the public square at New Glarus stands a monument extolling the virtues of the pioneer Swiss colonists. Center—The old Swiss Reform Church at New Glarus where the colony settled in August, 1845. Right—Some of the landscape of Green County is marked by rugged escarpments of precipitous rocks.



Left—Green County ranks first in the state in the growing of alfalfa and great care is taken to prevent the crops from spoiling.

Oval—Hundreds of thousands of dollars' worth of cheese is stored in warehouses at New Glarus and Monroe for curing.

Right—The Feldt farm near Juda is typical for its fine barns and convenient ways of handling dairy stock.

Do You Know How Your Red Cross Dollars Are Split Between Relief and Overhead?

Inquiry Reveals That Everything Having to Do With the Administration of Relief Is Baldly Charged to Relief Itself

The person who writes this and a second article on the activities and operations of the Red Cross has been with the Red Cross for several years and has seen the wheels of that organization go around. There is nothing but facts, dispassionately stated, here introduced. The second article will appear in an early issue.

A YEAR or so ago no question was so frequently asked as, "Of the millions contributed to the American Red Cross, how much of each dollar actually reached its destination and how much was spent for administration?" The question has never been answered and never can be now. The accounts were not so kept as to give this information so that the man who lives on Main Street could understand. In fact, the Mainstreeter gave his money at the instigation of a local committee, just as he would put a dollar in a church collection plate, and trust to the character of the deacons to distribute it wisely.

The average citizen did the same in subscribing to Liberty bonds and it was not until after the Great War that he became querulous about expenditures and then it was because he realized that he had lent the money to himself and had, as a taxpayer, to pay himself his own interest. It was probably just as well that he did not think too acutely—he only felt deeply—when he was giving to Red Cross or buying Liberty bonds, for all war is the negation of thinking, the reversal of logic. Conservation of human life is the main thought of peace, destruction of human life is the preoccupation of war, and the professional warrior admires extravagantly even his "enemy" when he accomplishes a particularly big killing stunt.

How Much Did It Cost?

IN EUROPE the national Red Cross societies were always and avowedly simple annexes to the commissariat and hospital service of the national armies. In America the original conception was rather the other way, and so it came to pass that the word "Neutrality" appeared on the great seal of our great national humane society. When, however, the whole world engaged in war, our Red Cross adopted, unconsciously perhaps, the European model and no longer used on its official stationery the imprint of the seal of the society with its proclamation of neutrality.

Taking it by and large, the conception Red Cross came to have of its own functions amounted to this: To do everything and anything that would help the morale or physical comfort of the American soldier, whether in camp in America or on the poppy fields of France, and, by a natural extension, almost anything that would comfort the family of the absent soldier. It followed, then, that the work of the Red Cross consisted primarily of service and no money value could be put on what was accomplished.

But Americans are insistent on quantitative answers to all questions, rather than qualitative. "How *much* did it all cost per dollar given?" It is the answer to this question that we propose to discuss, not because it is necessarily profitable but because so many people want to know. No attempt will be made to give exact figures, though most of them could be dug out of the Annual Reports of Red Cross, but the truth of the general statements made in this article can be absolutely guaranteed.

"The Greatest Mother in the World" was the favorite poster. Nursing service in the hospitals at the front or near the front was the average idea of the service rendered. But as the original nurses of simpler days were the unpaid mothers, who have given way to the specially skilled trained nurses of today who are paid a fair wage, just so, as the war wore on, the volunteers who tried to do all the work, without remuneration, were more and more replaced by hired folks possessed of special skill.

Three Hundred Millions Spent

THE set-up "in the field" in America was almost exclusively the work of volunteers. Thousands of women in every city, town, village, hamlet, countryside, gave of their time and housewifely skill to the making of bandages and garments for the soldiers. The money value of their work was simply enormous, the value in keeping up morale at home and abroad was even greater and the relief afforded suffering peoples in Europe by the distribution of the tremendous surplus left on the other side of the Atlantic after the boys came home was entirely beyond anything the good women could have conceived.

But the handling of these supplies implied warehouses at collection centers, warehouses and piers at points of shipping and in France, trucks, gasoline, laborers, and above all interminable bookkeeping at every turn.

Red Cross had only two "drives," nation-wide, one in 1917 and the other in 1918 (what the newspapers called "drives" since the Armistice were membership roll calls or appeals for funds for local chapters only), with a combined result of a little less than three hundred million dollars which was deposited in more than nine thousand banks out of which it was drawn, on a pro rata basis, over a long period of months (three years, in fact).

At headquarters in Washington there was a force of more than forty clerks, presided over by two New York trust company officials whose salaries and expenses were not paid by Red Cross. Clerks and stenographers were paid out of the collections. This force did nothing but count the money, paid into local banks by local committees (unpaid), redistribute to the local chapters the twenty-five per cent that had been allotted to them for materials, and so forth, and turn over to the treasurer of the Red Cross large capital sums on the request of the latter. On one occasion when the latter asked for five million dollars, the receiving organization had to draw more than three thousand checks from as many banks, deposit in a smaller group of about fifty banks, in turn drawing fifty checks on the latter, which were duly deposited in four banks of the Red Cross proper, from which the millions were disbursed in about four days. It was only by such a method that the official treasurer was able to disburse sums in large lumps.

The largest single outgoing check was for the dollar equivalent of five hundred thousand pounds sterling (about $2,237,000 at the then rate of exchange) and the largest incoming check was for eight million dollars representing the transfer of a residue of the amount contributed in New York City which was in one certain bank there. The outgoing check mentioned was a contribution by the American Red Cross to the British Red Cross, the funds of the latter having been nearly exhausted by the three years' strain on them before America went into the war.

The above details are given as to treasury operations only, but they indicate the need of salaried help actually to handle the raw funds of the organization at headquarters alone, with no mention of the fourteen division offices which maintained the contact with the local chapters.

At headquarters there was an accounting force, of one hundred and twenty persons (at the peak), which classified the receipts and disbursements, passed on all vouchers, and reported to the executive committee balances and other data. A similar accounting department, on each division office but on a smaller scale than in Washington, was maintained.

Requires Considerable Explanation

IN WASHINGTON alone the personnel reached a total of nearly fifteen hundred persons, about fifteen per cent volunteers and the rest hired men and women. Besides, there were the fourteen division offices, Paris headquarters (which filled one of the largest hotels there), and a reduced replica of the latter at the capital of each and every country where Red Cross operated.

What did it all cost? You may well ask, but it requires a fairly elaborate explanation to tell even how the answer cannot be given, at least not in such a shape as to be clear to the average business man.

There were two main captions under which expenditures were entered, to wit, "Administration" and "Relief," and a reading of the annual reports will disclose percentages only in a form like this, "Of so much money spent such a ratio was spent for 'Relief.'" "Relief" became a most capacious and inclusive term and only an accountant entirely devoid of a sense of humor, to say the least, could have expanded that word as was done.

The most famous percentage statement made (and that was not stated as percentage) was that which Mr. Henry P. Davison spread broadcast on the occasion of his remarkable tour of the country in the interest of the drive of 1918. It went something like this, "For every dollar you give to Red Cross the organization spent one dollar and two cents." The figures were furnished Mr. Davison by headquarters accountants and they were provable for a short time, but for a short time only.

Any man who has followed the stock market knows how corporation accountants can make their figures play any tune they wish. Tables of figures are like a piano from which either jazz or funeral marches can be evoked. When corporations are selling stock, only cheerful tunes come forth. Mr. Davison was selling Red Cross to the people (he sold more than one hundred and seventy millions on this trip) and the best figures were put forth. What's more, they were absolutely true—at the time—and no one was so astonished as Mr. Davison at the showing made.

Suppose a charitably inclined local magnate were to give his parson a thousand dollars for the poor of the parish. Then suppose that the parson, after two or three days' inquiry and the expenditure of a few carfares (charged to the charity money) were to report back to his patron a list of worthy folk to whom he had allotted the thousand, thus showing all the money laid out. Suppose again the parson failed to tell that most of the money was in bank drawing interest and that he did not propose to distribute it all at once; in fact, he could not wisely do so, but that he felt sure he could spend another thousand to good purpose, too. Granting the magnate approved of the list of beneficiaries, he would probably come across the second time.

This is exactly what America did for Red Cross, but as the parson had to spend a great many more carfares and took a much longer time to distribute his bounty than he calculated, the net cost of the charity increased while the amount distributed remained stationary. Counting the total of two thousands against the expenses of a few days and adding the interest on money waiting to be spent, the answer would look fine. In fact, in Red Cross, taking the cross-section at that particular time, a dollar and two cents *was* spent for every dollar received, the administrative cost appearing to be less than nothing.

BUT, the receipts of Red Cross were practically confined to the years 1917 and 1918, although the expenditures are still going on here in 1923. Having crabbed the entire capital amount to make a showing for 1917-18 there is no such factor for succeeding years when administrative costs continue although on a slowly reduced scale.

The accountants in Washington had a terribly hard time living up to the very enthusiastic and perfectly true "cost statement" of Mr. Davison. The latter gentleman probably never gave the figures another thought after they had so well served the purpose in hand, but the accountants plugged on, and in the course of a year or so were proving strange and weird things.

There's "Relief" and "Relief"

A NEW ratio was calculated: "The ratio of 'relief' expenditures to total expenditures." That did very well for a time, but soon "relief" needed relief badly, so "relief" began to expand until the following result was arrived at—than which it could go no further.

Bureaus at headquarters and in divisions were divided into "Relief Bureaus" and "Administrative Bureaus." Then every cent that was spent for stenographers in, say, the Nurses Bureau or the Bureau of Military Relief was said to have been spent for "relief." The ingenious accountants went further. They measured the number of square feet occupied by "relief bureaus" at headquarters and in the divisions, also the space occupied by pure administrative bureaus like the treasurer's office. They totaled the cost of grass-cutting, coal, sweeping, electric lights, and so forth, and such part of the latter cost, per square foot distribution, as could have been consumed by a "relief bureau" personnel was "relief."

The accountant had a theory, which no one could laugh away, that the wage of the colored woman who swept out the office of the absolutely stationary (in America) head of the nursing department was just as much "relief" for a sick or wounded soldier as the wage of the nurse at the front in France. He settled the whole question of expense in Paris (a big hotel full of stenographers, janitors and the like) by calling every cent that went abroad, for whatsoever purpose spent, "Relief in Europe." In other words, no cent of administrative expense was owned up to as having been incurred on the other side at all. The American colony in Paris are still talking about the big salaries paid at the Hotel Regina, Avenue Gabriel, Rue de Chevreuse, and at the four or five warehouses in the environs of the city, but they do not know that the cost of a bottle of ink and the cost of a lunch for a wandering soldier were alike credited on the books of Red Cross under the head "Relief in France."

An Entirely New Job

THE same accounting obtained in Warsaw, Vienna, Budapest, Constantinople Riga. Despite expenditures for ink, rent, coal, stenographers, paper and what not—all was "relief"; none was "administration."

Then there was other clever figuring. For instance, the treasurer of Red Cross was amazed to see, in 1920, a copy of a circular which went to the country in an edition of many millions which showed (duly certified to by the controller of the organization) that Red Cross had, apparently, only three hundred and odd thousand dollars left out of its millions when his balances showed about forty million cash in named banks and about twelve millions in Liberty bonds and other securities.

The treasurer asked, most vigorously, for explanations. He found that all but the three hundred and odd thousands had been "appropriated" and he also found that the word "appropriation" was as useful a word in showing poverty, as "relief" was in showing efficiency

Noble Sons of Girard

SINCE 1848 Girard College, Philadelphia, founded by Stephen Girard, has been educating boys who would otherwise hardly be able to go to college. It is the impression of the alumni of Girard College that their education has been paid for principally by royalties on Pennsylvania coal lands. Since the series of anthracite coal disputes this fact seems to have struck home to the moral sensitiveness of the beneficiaries of Girard's generosity. As a result of this the Girard Alumni of the Lehigh Valley have petitioned the trustees of the Girard Estate to take such action as the Alumni feel Stephen Girard would take in the circumstances. It is said that the trustees were much displeased by the petition. On their side, the college men feel that since their education was procured by coal land royalties they have a right to absolve themselves from selfish participation in the system which prevails. As one puts it, "we boys who were fed, clothed and educated by Stephen Girard's money feel it our duty to do all in our power to have this situation changed."

The petition sets up that the Girard Estate owns the greater part of the valuable coal deposits of the anthracite region of Pennsylvania. The plea then is that the Girard Estate mine coal instead of merely getting royalties, and dispose of the coal at a fair price after fair wages have been paid, "on the same principle that the Girard Estate has been handling the homes which they built in South Philadelphia." "Were the mines worked on the same principles as you manage Girard College you would undoubtedly have in the miners and coal consumers as dear friends as you have in all Girard Boys." The petition also asks that Mining be taught to the students of Girard, to the end that future mine men in Pennsylvania may be imbued with the right spirit in their work.

Without present knowledge of the extent of the Girard holdings, we have no hesitancy in commending the spirit of the Girard Boys. If, as many of them were told in College, the Girard Estate does own considerable proportion of the coal lands, it is to their honor that they desire, in their own name and in the name of their benefactor, to change the basis of income from royalties to actual production and control. The Girard Alumni have put up a stiff proposal to the trustees. Displeasure is no answer. If education is ever to justify itself it must be in attitudes such as that exhibited by the students rather than in the trained cunning of exploiters of the public.

The Banker Describes the Farmer

WITHOUT comment, the following alleged portrait of the mentality of the American farmer is presented for consideration. It was published by the Commonwealth-Atlantic National Bank of Boston, and signed by its president:

"THE POLITICAL MENACE

"The American farmer takes only an academic interest in all this. He is an unimaginative human. He works hard, but he works in an established groove and his lack of imagination makes it impossible for him to follow the relation of cause and effect in matters beyond his immediate view. He sees his neighbor's children, of whose ability he has no specially high opinion, go to work in the nearest town and receive in a year more money in wages than he himself ever made in his life. He concludes that something is wrong somewhere, and when the politician tells him that the fault is with 'Wall Street' or Washington he is inclined to accept the statement. If the politician told him that he would get more for his crops if the German reparations question was settled and the American Merchant Marine was operating profitably and with many ships, he would not believe it. Therein lies the great political problem of the United States. So far as any one class or occupation can dominate, this country is ruled by the farmer, and yet he has nearly always been misrepresented by his representatives. He has had men like himself in the Senate such as Senator Peffer, from Kansas, in the early nineties, and now another has been elected from Minnesota. Such men serve him even worse than the professional politician who usually receives the farmer vote. The kind of representative he should have is the highest type of educated, faithful, patriotic public servant, but few such can get his vote, for he does not like to have the truth told to him, and he will not believe the facts beyond his horizon.

"What good would it do to tell the farmer that higher railroad freight rates mean better railroad service and facilities for himself. That mercantile prosperity throughout the world means better demand in Europe for our farm products. That such demand means higher prices in European markets. His reply would be that even if it were so 'Wall Street' would get all the profit and every one but himself would be the gainer. He is a confirmed pessimist and his chief happiness lies in having it constantly repeated to him that he is the most illtreated of humans.

"His knowledge of economics is of the crudest kind and several times he has carried the country to the brink of the same sort of ruin that now faces Germany, but we have always escaped, partly by good luck and partly because of the slow-working nature of our political machinery. It seems probable that the same causes will again operate during the coming year to prevent the enactment of false economic laws such as so many are generally apprehensive of. The present administration will continue for at least a year and a half longer, the farmers may quarrel with the labor unions, England may effect a final end of the war in Europe in spite of the indifference of our farmers, and the price of food products may go up before next spring. Meantime there is little to be done except for the business community, the banks and the far-sighted intelligent portion of the public to continue to educate and enlighten the newspapers, the farmers and the prejudiced, that economic laws cannot be changed by legislation, and that in the end all classes in the country suffer by the enactment of laws aimed against particular groups.

GEORGE S. MUMFORD, President."

Two Christmas Ideas

TWO Christmas notices have come to this office, one from a religious journal, another from a Board of Commerce. Both show a touch of conscience toward the prevailing secularization of Christmas to which The Dearborn Independent was the first to call attention several years ago. *The Continent* discusses the matter of Christmas cards, advising that definite request be made for cards related to the Christmas fact and the Christmas sentiment. The card manufacturers who have surrendered to the trend of "jazzing" Christmas simply fell in with a deliberate alien program (fell unwittingly in some cases) to destroy the significance of the Festival of Christ's Nativity. Those who innocently assisted this program will be first to supply the demand for legitimate Christmas cards which *The Continent* suggests be made.

The Detroit Board of Commerce, through its Retail Merchants' Association, lends its influence toward the correction of an abuse which has nothing to excuse it. The letter is so pertinent that extracts are here given:

"Will you co-operate with the Retail Merchants' Association in its endeavor to eliminate the so-called word 'Xmas' from all advertising, letters, or any other forms of publicity or communication? We are making this direct appeal to the reputable stores and advertisers of Detroit in the hope that we may eliminate the so-called word and drop it forever into oblivion. Christmas is without doubt the most universally observed holiday of the American people, and just why this so-called word should have sprung into such prominent misuse, we are unable to ascertain . . . . We are convinced that Detroit business men will willingly establish a rule in their places of business beginning this date that the word 'Christmas' must be spelled out in full in every instance. At the meeting of our Board of Directors this matter was brought up and by a unanimous vote it was decided to make a city-wide campaign to eliminate the word 'Xmas' from all advertising."

Both suggestions are right and can be objectionable only to those who have nothing whatever to do with the Festival itself.

The Breaking Point

THE idea is soaking in. Interest-bearing debts have all but sunk American municipalities. Slow as are the borrowers to get the idea, the lenders are already alarmed. Here is what the representative of a bond company said to the League of Minnesota Municipalities, as reported in the magazine *Minnesota Municipalities*:

"I wish to call attention to the direction in which municipal borrowing is now headed. We bond men live as we can buy and sell bonds, but nevertheless we have a feeling that we are being called upon to buy and sell too many municipal bonds for the permanent health of the communities for which we are selling. Take Minneapolis and Hennepin County as notable examples: The last session of the legislature authorized the issuances of bonds for several purposes which will probably be sold in the next two years equal in the aggregate to at least a one-fifth increase in the present bonded debt of city and county. Interest and sinking fund on these new bonds must be added to the present debt-paying schedule . . . . Many of the smaller cities are tending in the same way toward heavily increased borrowing."

A Minneapolis official also said:

"Municipal bonding may be described as the drug habit of modern cities. It provides an easy means of securing funds to make desired improvements, while obscuring the burdens to be thrown upon the taxpayers. It is not unusual to find outstanding bonds which have been issued to provide money for improvements which have long since been replaced . . . . Like all drug habits, it is easy to acquire but difficult to keep within proper bounds."

There are the two ends of the business—the profit end and the paying end. When both agree, the situation is becoming an emergency. Not in Minneapolis—the reference here is not to that city. Compared with some cities, Minneapolis is a paragon of prudence. But the whole system is wrong—financially, socially and morally wrong.

"The President and the Governors"

CONFERENCES are under suspicion. They have been mere exhaust valves. But President Coolidge's conference of the Governors took on another aspect—it became a primary class in the a b c of official responsibility. The President simply said that he and the Governors had taken an oath of office which included a solemn promise to defend the Constitution of the United States, and the Governors admitted that they had. It was a fact long before the Conference and it is a fact now. Admitting it to be a fact appears to have been a simple matter occupying a very short period of time. It remains to be seen how much force the fact has.

The really startling thing about the Conference was the tacit assumption that those who had taken an oath to defend the Constitution of the United States were not doing so. But they promised to do so henceforth. Maybe the public redemption of this promise will be visible in the District of Columbia, which is, of course, Washington, D. C. The Conference was called for no other purpose than to deal with the liquor question (although the President mentioned two other matters first) and Washington would be a fine place to begin law enforcement. Mr. Coolidge is in his own territory there and might be able to show the Governors how to do it. As long as Washington is, privately, one of the wettest cities in the country, its voice in favor of law observance will have little weight.

Mr. Coolidge, in this his first extensive utterance since assuming the Presidential office, kept well within recognized limits. He said what every school child in the country knows. He made one point very clear, that it is a State's duty to uphold the Constitution of the United States and not only the Federal Government's duty. That being true, all the Governors, even Governor Smith, of New York, agreed. Whether the agreement means anything is for the future to determine. But it would be a great advance if the phrase used by the President—"The President and the Governors"—really came to mean an agreement of power and purpose in this country.

What Are Parties?

PARTIES begin with idealists and end with politicians. Parties are born in the need of an ideal, they grow to strength in their unselfish service to the ideal, and they die when they esteem the offices through which they have served as of greater value than any ideal. In the last stages they frantically grasp ideals to hold on to the threatened offices. There will always be new parties for new ideals, or old parties converted and cleansed. The latter, however, never seems to occur, and the former never occurs without deep cause.

Mr. Ford's Page

IF ADVICE were wealth there would not be a farm mortgage in the United States, for there is no more discussed man, no more advised man in the United States, than the farmer. The worst of it is that advising the farmer is becoming a professional business. It is usually undertaken for the benefit (political or otherwise) of the advisor and not for the benefit of the farmer. It is the kind of assistance that costs nothing and helps nothing. It is undertaken on the theory that the farmer has a vote, not on the theory that the farmer has a need to be filled.

The farmer, like the tariff, has become a thing to be juggled for political purposes. Who can remember a political platform that has not used the farmer as one of its planks, and who can remember a political act that has ever been of practical assistance to the farm? Count up the number of schemes proposed to help the farmer, some of which have even been put into operation, and then lay alongside them the facts of the farmers' condition as it has developed from year to year. The result is that the more the politicians have boasted of helping the farmer the louder has the farmer complained of his condition growing worse and worse.

THE farmer has a vote; he has the natural sympathy of his fellow citizens; therefore he becomes important to the politicians. Every party promises to rescue the farmer, and yet he says his plight is worse than ever. The present remedy for his burdens of debt is to make it easy for him to go deeper in debt. He is asked to go partners with former Wall Street men in squeezing the public between them. No one has courage to tell the farmer that there is no political cure for his condition, and that his only hope is in himself. No one has courage to tell him that farming is in process of change. The advice offered him has his vote in view, not his benefit. The farmer has friends whose advice is good, but they are not politicians.

The farmer as a farmer and not as a voter has been forgotten. The farm and the business of the farm have received the barest attention. The height of the "assistance" offered him of recent years has been to assist him to get more easily in debt, though debt is precisely the curse from which the farm needs to be relieved. And though the Government has actually made millions of dollars available to the farmer his condition has not improved, the reason being that a debt to the Government is just as burdensome as any other debt, and even more so, because not only must the farmer pay the debt but also support the Government which makes it and in addition bear the enormous costs of the Government's unbusinesslike methods in making the loans. Government aid to the farmers resembles that proposed to the soldiers in the bonus, which would cost the soldiers individually more than they could ever receive and be a total loss all round.

It may be true that the farmer needs advice, but the first advice he needs is to disregard most of the advice that is now being offered to him. And the second advice he needs is that all the real help he will ever receive will come from himself. Not that he alone is interested in his condition. All his fellow citizens are interested, too. But there are various kinds of interest. One is the political interest of the partisan who wants the farmer's vote. Another is the commercial interest that wants the farmer's profits. The truest interest is the economic interest which realizes the essential part the farmer plays in our common life and is keen to remove all the hindrances to the farmer's rendering his full economic service and getting his full economic rewards. The latter interest is steadily coming to the front.

In the meantime this true interest is being imitated. In the name of economic soundness many plans are being offered. Self-appointed guardians of the farmers are going to and fro about the land on errands which profess to be the height of unselfishness. The alleged object of one of these proposals is to rescue the farmer from the juggling of the boards of trade and the wheat pits. This form of gambling is peculiarly injurious to the farmer. Its power to harm the public in the price of bread has been largely nullified, but its power to harm the farmer in the sale of his product remains as great as ever it was. Certainly its power to harm should be destroyed.

But it is well worth considering in the meantime that if an organization is forming to take the farmer out of the peril of the wheat pit only to put him in the power of some other system, the promised benefit may not last long. As long as the market is artificially manipulated to give the farmer the lowest price at the time he must sell, efforts must be made either to prevent the manipulation so that the harvest sale may be fair, or else efforts must be made to enable the farmer to extend his period of sale throughout the year. The latter plan is proposed by some. If it is assumed that the evil of manipulation must continue, maybe that is the best plan. But if it be assumed that the manipulation can be prevented, then it may be better for the farmer and the nation to do the harvest business at once and have it over with.

That is, of course, taking the long view of it. For it now appears certain that farming is not likely long to continue what it has been. Changes are coming. The farmer's year, which is now but a few months, will become longer and fuller. That is, with improved methods his year of actual crop-raising will become shorter, leaving him more months to be filled with other kinds of profitable activity. If instead of enlarging the farmer's productive opportunities it is proposed to make him all the year a market-watching wheat merchant, little is being added to the total desirability of his position and nothing at all is being added to the country.

When the raising of a crop is reduced to the short period of planting and to the short period of harvesting, and other avenues of production are opened to the farmer, the plans now proposed will already be obsolete. Taking the long view it is possible to construe some of the present activities as attempts to get the farmers out of one kind of sales control to put him under another kind. It is entirely possible for the manipulators of the new plan to make it profitable to the farmer for a few years by merely splitting between themselves and the farmer the profit which is now entirely taken by the speculators, but it is certain that the splitting will become less and less for the farmer and gradually cease altogether. This conclusion is forced by the past history of the men who are foremost in the new task of saving the farmer.

There are, of course, genuine friends of the farmer and some of them are in public life. But there is this to be noticed about them, they are representatives of the farmer himself, they are not representatives of successful speculative careers who pretend to be at last generously putting their speculative brains at the farmers' service. Wall Street men who are offering to show the farmer how to beat Wall Street if the farmer will give them the business are more to be shunned than high-powered salesmen of spurious stocks.

Pending the change which must overtake farming and which will be discussed more in detail later, there must not be anything resembling anti-social combinations, and if the record of the American farmer stands for anything, there will not be. The farmers' record, so far as the intention of straight service is concerned, is clean. But proposals are now being made on every hand that as formerly the speculators and exploiters squeezed both the farmer and the public between them, now a new group of exploiters who hope to become allied with the farmers will squeeze the public between themselves and the farmers. The farmers, it is felt, will never consent to this when they once see which way it is headed, because they will know instinctively that that is not only *not the solution* but a calculated plan to increase the social confusion and misery. Not a wider and more selfish separation of the farmers and the citizens is desired, but a closer union between them, with the speculative middleman who has so ignobly refused to perform his possible service eliminated.

The farmer should classify his advisors, who they are, what they have been and what their real interests are likely now to be. And then take counsel of himself, of the causes of his situation as he can trace them. Self-examination behooves all lines of business now, and if some of the results are humiliating to us, it will only be proof that we are coming near the impartial truth.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Lasker Influence Still Rules Shipping Board

Farley Appointed to "Carry Out My Policies," Former Chairman Announces

By a Washingtonian

What are we going to do about our merchant marine?

The infamous subsidy measure was killed and its revival must not be permitted.

But influences just as sinister as those which have gone before are at work today to turn over the American fleet to interests whose motives are purely selfish. This too must not be permitted.

THE DEARBORN INDEPENDENT, from time to time in issues soon to appear, will disclose, for the benefit of the people and the people's representatives in Congress, facts which speak for themselves. It is to be hoped that these facts will be sufficiently awakening for Congress to institute an inquiry designed to search out and make known ALL the truth about the operations of the United States Shipping Board.

WHAT lies in the future for the American Merchant Marine?

Although the subsidy measure proposed by former Chairman Albert D. Lasker, of the Shipping Board, and sponsored by the President was killed in the Senate in the last session of Congress—the taxpayers must give serious thought not only to what has happened to this fleet of ships which has been consuming between $40,000,000 and $50,000,000 a year of the people's money under the Lasker-Lissner-Schlesinger-Freund régime, but what is going to happen to it.

Lasker, the "super-salesman" and advertising agent from Chicago, as chairman of the Shipping Board "sold" President Harding the subsidy idea—a plan compiled upon the advice and with the assistance of the private ship operators who were to be direct beneficiaries under the act. And President Harding, without submitting the subsidy program to his cabinet, made it a paramount party issue. The result was one of the bitterest fights in Congress since Mr. Wilson's League of Nations rumpus—and the subsidy measure was killed.

Mr. Lasker is vindictive when crossed. That is common knowledge among the press correspondents. It is well known in Congress by any Senator or Representative who did not agree with Lasker's policies. It is also well known by many who have lost their positions because they could not see the wisdom of Mr. Lasker's course.

So, then, it may well be expected Mr. Lasker will not readily forgive the Congress for having killed his pet project—a subsidy which would not have sold the ships at all, but would have paid a premium to those who accepted them as gifts, would have made it possible for Lasker to crush ruthlessly any and all competition for his favorite companies and combinations, and would have left the distribution of hundreds of millions in subsidies entirely in Mr. Lasker's hands, or the hands of his successors in office.

After the trumpeting, the stream of press statements, after two years of Mr. Lasker's bombast—where is the fleet, where is the merchant marine, where is the American pocketbook?

To formulate some concept of what is to happen, it becomes necessary to look into the past and ascertain, if possible, whether the Lasker-Lissner-Schlesinger-Freund régime was anything remotely resembling the success Mr. Lasker modestly admits he has achieved.

The new chairman, Edward P. Farley, of Chicago, was Mr. Lasker's selection.

Mr. Lasker announced to the world that "Mr. Farley is in sympathy with my plans and will carry out my policies," although as author of these policies Mr. Lasker declared during the joint Congressional committee hearings on the subsidy bill that "I have really only been a regular advertising expert until I came down here to handle this shipping. I will say this, if you will just give me six months away from here, *I will go into the agricultural problem and try to help you solve that, too.*" Lasker doesn't lack self-confidence, even though, perhaps, he could with propriety leave that problem to Aaron Sapiro, Eugene Meyer and Barney Baruch.

"An Expert in Publicity"

RESPONDING to another question propounded by Representative Ewin L. Davis, of Tennessee, Mr. Lasker said:

"I was the only man who would take this job. The President couldn't get anyone else, and as Eva Tanguay says in her song, 'Gee, it is great to be crazy.'"

On another occasion, in a hearing before the House Appropriations subcommittee, Lasker declared, "I am not an expert in shipping, but I take a little pride in being an expert in publicity."

Subsequent events seem to have proved his statement—both ways—quite conclusively, as we shall presently see.

That Mr. Lasker was not only the head, but the whole of the Shipping Board is shown in a statement made on the floor of the House by Representative Davis—and never refuted. Said Representative Davis:

"And right in that connection I want to say that two newspapermen who were present at a newspaper conference with Chairman Lasker said that Chairman Lasker told them that the President had advised him that if any member of the Shipping Board did not go along in harmony with Chairman Lasker in his policies, he—Lasker—should notify the President and he would discharge such member of the Shipping Board; that the only reason he appointed any of them, except Mr. Lasker, was because the law required it."

So, since Mr. Farley is the personal choice of Mr. Lasker, and since Mr. Lasker was the whole Shipping Board, insofar as policy was concerned, and since Mr. Lasker was the man who "sold" the President on the subsidy measure which was prepared with the assistance and advice of those interests which were to reap the subsidy if it passed, and since Mr. Lasker has laid down the policy of twelve or eighteen private corporations to carry on governmental operation in a manner comparable as to methods to the Emergency Fleet Corporation, the Controller General, Mr. McCarl, meanwhile *being barred from any investigation into, supervision over, or interference with their accounts, or the expenditure of government funds to be turned over to them*—we must go into the past two years' administration of the Shipping Board—the Lasker-Lissner-Schlesinger-Freund administration—to find the answer as to what lies in the future under the Lasker-Lissner-Farley administration.

Mr. Lasker took office as chairman June 30, 1921.

The President had looked around for somebody to take the job, and, while there was a government-owned steamship concern at Panama operated at a handsome profit by Thomas H. Rossbottom who hadn't made any noise about it either, the President finally chose Lasker, the Chicago advertising agent and member-at-large of the American Jewish Committee.

Inexperienced in even the rudiments of ship operation or anything remotely resembling it, Lasker had not been in office a month before he was heralding to the world that "the Shipping Board is a colossal wreck, a mighty sick organization with a fleet of mighty sick ships."

The Truth About the Wooden Fleet

PICTURING the whole situation as chaos in the last degree, Mr. Lasker saw to it that no opportunity should be lost to impress upon the people what a terrible condition their Shipping Board and their war-born merchant fleet were in—what a tremendous job it would be to cure the situation—and what a remarkable achievement it would be when he had accomplished it.

This, of course, was astounding from a man of Mr. Lasker's temperament—he's so modest, usually!

Was there a motive behind his studied abuse of the former Shipping Board, something more than merely the Lasker love of bombast? By and by we shall see.

Within a month after assuming office Mr. Lasker felt able to declare, "The accounts of the Shipping Board and the Emergency Fleet Corporation have been so badly kept that I am drawing a red line between July 1, when I took office, and all previous transactions, for there is nothing remotely resembling an accurate figure in the accounts as they have been kept."

And Mr. Lasker immediately made a contract with the firm of Lybrand, Ross Brothers & Montgomery—of which more will be said later—to change the whole system of accounting—which was done. Lasker then began to discharge those who had knowledge of the board's past actions. And, after a month's experience in a business to which he was a total stranger, this advertising agent from Chicago began to tell Congress and the country that "they must have confidence in me and leave it in my hands," without being told anything of the methods, the expenditures, the plans for the future. And, when compelled to meet Congress when appropriations were asked for, Mr. Lasker proved himself the artful dodger supreme.

The method by which a group of Jews took possession of the Merchant Marine, what was done in the sale of the wooden ship fleet, how shipyards and valuable lands were sold for a song, and hundreds of millions of dollars' worth of supplies sold for from seven to nine per cent of their cost with a loss of hundreds of millions which could have been avoided, and how $500,000,000 worth of negotiable securities were disposed of and the disposition and receipts never accounted to Congress or to the Controller General to this day despite the insistent and repeated demands of Congress through individual members for some information—this is the startling chapter which the advent of Mr. Lasker opened.

In the gigantic task which faced us, to save our Allies from being swept clean of shipping, we frantically built ships, among them a fleet of wooden boats at a cost of $300,000 000, some 300 ships of which remained when Mr. Lasker took office.

Under the Jones Merchant Marine Act of 1920, the purpose of which was to dispose of the surplus ships, the Shipping Board was instructed "to sell, as soon as practicable, consistent with good business methods and the objects and purposes to be attained by this act, at private competitive sale after appraisement and due advertisement," all these vessels. Further provision was made that "Such sale shall be made at such prices and on such terms and conditions as the board may prescribe, but the completion of the payment of the purchase price and interest shall not be deferred more than fifteen years after the making of the contract of sale. The board shall take into consideration the prevailing domestic and foreign market price, the available supply of, and the demand for vessels, existing freight rates and prospects of their maintenance, the cost of constructing vessels of similar types under prevailing conditions, as well as the cost of the construction or purchase price of the vessels to be sold, and any other facts or conditions that would influence a prudent, solvent business man in the sale of similar vessels or property which he is not forced to sell."

How did Mr. Lasker carry out this act?

He proceeded immediately to devote most of his time to condemning and disparaging the goods he had to sell. Was this "consistent with good business methods?" No, but Mr. Lasker thereby laid the foundation for his first premise—that the government could not proceed as intended under the Jones act, as "a prudent, solvent business man in the sale of similar vessels he is not forced to sell," would proceed. As Representative Davis, of Tennessee, said on the floor of the House, "Although called to head the Shipping Board and to dispose of our vast government shipping interests, he seems determined to destroy the investment. He talks much more about sinking the ships than he does about selling them. He seems infinitely more concerned about saving his own 'mutton' than he does in the welfare of the 'sick patient' which he says he has inherited. It is understood that he made his reputation and success in the advertising business, but I am sure he did not make that success by advertising and magnifying the defects and worthlessness of the goods that he sold or advertised for sale prior to the time he entered the service of the government."

Now, about the wooden fleet. After advertising the ships for sale, at a time when Mr. Lasker and his $35,000 a year adviser J. B. Smull, both declared, "There is no possibility of selling boats today at any price," Mr. Lasker proceeded to double-clinch the fate of the wooden ships during the hearings of the subcommittee of the House Appropriations committee.

Not satisfied with the fact that on account of the most tremendous depression in shipping ever known in history there was no demand for the ships, Chairman Lasker began immediately to berate the wooden ships in the most violent manner. "These ships are absolutely useless," he told the committee and the newspapers, "and should be sunk." Which is hardly what "a prudent, solvent business man not forced to sell," would do.

He was asked the following question and gave the following reply:

Mr. Kelly (Representative from Michigan)—"Of course this is not the right time to sell any kind of ships. You would have considerable difficulty in selling a steel ship, would you not?"

Mr. Lasker—"I make the prediction that you will never reach the time when you will sell those wooden ships. You cannot give a ship away today. I mean that literally, if a man must pay the cost of operation."

And later in his testimony before the same committee Mr. Lasker said:

"I am going to sink the boats if we cannot sell them or give them away."

Whereupon Representative Kelly was moved to observe that, "Of course, with your declaration to that effect you would not expect to get much of a price for them hereafter."

Now what happened?

In spite of the most earnest efforts of Chairman Lasker to discourage the sale of ships in which the people had $300,000,000 tied up, in particular, Chairman Lasker received a short time after from the New York Ship Construction & Trading Company a bid of $2,100 a ship for the whole fleet.

On August 9, 1921, the Shipping Board adopted a resolution unconditionally accepting the New York company's bid as amended at the request of the board on August 5. A certified copy of the resolution was furnished the bidder, who had put up a certified check for $60,270 as a ten per cent guarantee of his bid.

Then things began to happen. Those "absolutely worthless ships" which Mr. Lasker had damned publicly, were wanted by somebody. So on August 15, following, Sanford H. E. Freund, a Hebrew lawyer of parts from Chicago, was called in by Mr. Lasker to "look over the contract" which had been prepared by the bidder. Freund immediately drew another contract based on the original and not the amended bid, which was presented the New York company to sign, but was, of course, rejected and Freund was told of the amended bid. He drew another contract next day practically similar to his first one—and, of course, it was rejected by the bidder.

"Fishhooks" in Contract

MEANWHILE E. P. Farley, Mr. Lasker's present chairman of the board, and Commissioner Plummer, of the board, had been delegated to handle the New York Ship Construction & Trading Company's bid—but Freund now succeeded Commissioner Plummer in the negotiations.

During this interim two wealthy Jews of San Francisco, the Messrs. Fleischhacker, of the Anglo-London-Paris Bank, and the Anglo-California Trust Company—about whom more will later be related—began to want those wooden ships. Evidently their private advices did not agree with Lasker's much-heralded declarations that the wooden ships "are absolutely worthless."

So the New York Ship Construction & Trading Company found Mr. Farley and Mr. Freund "out of town" whenever they sought to close up their deal. This condition obtained for eight or nine days. Then Mr. Lasker and Elmer Schlesinger, another Hebrew lawyer of parts from Chicago, Lasker's personal attorney for years, apparently consulted. It was hinted, 'tis said, to M. S. Orth, attorney for the bidders, that Messrs. Fleischhacker, of San Francisco, wanted half the ships and that matters would be greatly expedited if the New York Ship Construction & Trading Company would let the Fleischhackers have half the wooden fleet at, say, $2,400 each for the ships.

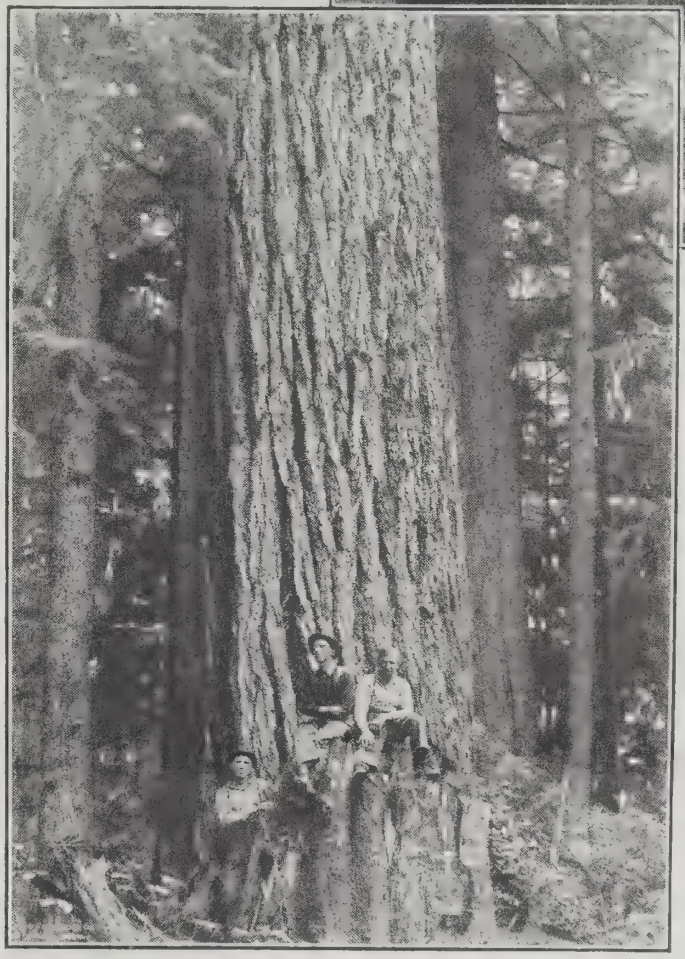
Firs of the Northwest Leviathans of Forest

Slopes of the Mountain Ranges of the Pacific Coast Hold Great Store

By FRANK DORRANCE HOPLEY

Right—Extending from far up the Alaskan coast to Mexico the Douglas Firs are the tallest trees in America next to the Redwood.



Below—There is enough lumber in this one tree to build a five-room cottage. It is about twelve feet in diameter.

WHEN Columbus first sighted the shores of the New World on that memorable day in 1492, there were standing in the virgin forests of the Pacific Northwest thousands upon thousands of gigantic Douglas Firs, their branches reaching skyward—forests uninhabited except by the beasts and birds who had never seen the face of man. Many of these trees, it is said, still stand, grown to an enormous size, some six, some twelve, some twenty-four feet in diameter.

When, in obedience to repeated blows of the woodman's axe, they fall crashing to the earth, their log of life—a record of each year from before the time that the Great Discoverer sailed the seas—stands disclosed, showing clearly by its concentric rings the age of these patriarchs of nature, which in their death, after centuries of waiting, begin to serve mankind.

There on the slopes of the Cascades, the Coast Range and the Olympics of Oregon and Western Washington, is the enormous forest of Douglas Firs, stretching in the United States over a space 500 miles long and 100 miles wide, in which there is standing today, it is estimated, more than five hundred billion feet of lumber, which has been untouched by the woodman's axe, and has yet to feel the bite of the buzzing saw eating into its vitals.

Trees are to be found there, each one of which contains enough lumber to build a five-room cottage; not one tree alone but a forest of them. It is something to bewilder the imagination; to give a spirit of romance to the prosaic life of the woodcutter, and to open the eyes of those who have never given a thought to the greatness of the Pacific Northwest.

The capacious maw of industry and development, always wanting to be filled by eating, eating into the forests of the South and East, and never being satisfied, is depleting the timberlands of those sections to an alarming extent, and while reforestation is carried on to a considerable degree, the encroachment upon the forest reserves goes on unceasingly from day to day.

It is estimated that, normally, each year there are erected in the United States more than 400,000 houses, and today the builders are a million houses short of the demand. What will happen in 1950, but a comparatively short time hence, when it is estimated the population of the United States will be 150,000,000 persons? How shall they be sheltered, and whence will come the wood to be used in the building of their houses?

From the forests of the Pacific Northwest would seem to come the answer.

When President Lincoln called for volunteers in the Civil War, the battle-cry resounded: "We are coming, Father Abraham, one hundred thousand more."

Today, from a thousand slopes and hills, in response to the call of industry and the home-builder for lumber to carry on the development which has but just begun, comes the battle-cry of the woodcutter:

"We are ready with one thousand billion feet of board, cut from the forest of the Douglas Fir."

Staggering? Bewildering? Yes, but nevertheless true; for in the forests of the Pacific Northwest it is estimated there is enough timber to build more than 40,000,000 houses of the ordinary type—three times as many houses as stand today from Maine to California and from the Gulf to the Great Lakes.

The Douglas Fir region includes practically all of Oregon and Washington west of the Cascade Mountains, and reaches far into British Columbia. That portion included in the forests of Oregon and Washington has a width of from seventy to one hundred seventy miles, and a length of nearly 500 miles, approximating in area 54,000 square miles, or as large as the New England States with New Jersey thrown in for good measure.

In its topographical make-up the region varies greatly. There will be found valleys, high table-lands, rolling hills and mountains, intersected by rivers and lakes.

While the Douglas Fir to be marketable must be upward of fifty years old, the similarity of the timber as to points and volume of stand has resulted in uniform logging methods. As mild winters in this locality are the rule rather than the exception, logging can be continued throughout practically the entire year.

Agricultural Bulletin No. 711, speaking of the Douglas Fir, says:

"The Douglas Fir is one of the most important American woods. It was early shipped to different parts of the world for masts and spars, and was the first tree in the region to be manufactured into lumber on a large scale. It ranks second in the United States in point of production, being extensively used in the building trades by the railroads in the form of car and bridge material, ties, and piling, and by many manufacturing plants.

As a structural timber it is not surpassed, and for a long time was most widely known in this capacity.

Originally covering, in forests of great density and almost absolute purity, the greater part of the foothills and lower slopes of the Cascade Mountains and the Coast Range, it comprises about seventy per cent of the standing timber in this region."

The Douglas Fir is a giant tree rising often to a height of 175 to 250 feet. In manner of growth it forms a very dense forest and has been known to yield as much as 100,000 feet an acre. On the small tracts much more than this frequently has been cut.

The ability of a tree to endure shade, or in other words, its demand for light, decides how many trees will grow on an acre and is, therefore, an important characteristic of a tree.

The Douglas Fir is a vigorous, hardy, rapid-growing tree, capable of thriving under a great variety of conditions. It is moderately dependent upon light, being able to endure more shade than some of its associates.

During the first few years of growth, however, it is important that the Douglas Fir shall receive direct top light; trees that are very shaded by their neighbors quickly die.

Douglas Fir, to attain optimum development, should grow in even-aged stands, where all the trees are about the same height, and all receive direct top light. This ability to form dense stands accounts in part for its immense yield per acre.

The density of the stand, however, has a material bearing on the quality of the timber produced. Trees that have developed in a dense stand are more cylindrical, their limbs are smaller and they shed their dead branches earlier than those grown in the open.

In a well-stocked stand the shedding of dead limbs begins when the trees are about forty-five years old. When a tree has reached the age of eighty years its trunk should be smooth and clear of dead stubs well up to where the live branches begin. In the denser stands, the Douglas Fir will not produce any clear lumber until it is fifty or sixty years old.

The Douglas Fir has a heavy and fire-resistant bark, and after about twenty-five years of age a forest of this species is not apt to be killed outright by a forest fire.

The color of the Douglas Fir is varied, ranging from a decided reddish tinge to light yellow, and on this account it is sometimes classified as red and yellow fir.

As a rule the red fir has a coarser grain and contains a considerable amount of dark-colored wood which is called summerwood. It is usually obtained from second-growth timber or from the heart of the older trees. The yellow fir is a soft, fine-grained wood, obtained from the outer portion of mature trees. The difference in color is supposed to be due mainly to the difference in the rate of growth.

The Department of Agriculture Yearbook for 1922, in commenting on the timber supply, states:

"Nearly half the land area of the United States, some 822,000,000 acres, was originally forested. The stand, mainly of high-grade material, probably far exceeded in volume the estimate of 5,200 billion feet board measure made some years ago.

"American standards of living and much of our industry have been developed upon timber supplies so abundant and cheap that the United States today is the largest consumer of wood in the world. We now use nearly half the lumber, more than half the paper, and about two-fifths the wood in all forms. We produce from two-thirds to three-fourths of the naval stores. The timber to supply our demands has been mined from the forest much as coal has been mined from the ground.

"Largely through timber mining the original stand has been reduced from more than 5,200 billion board feet to approximately 1,600 billion feet of virgin timber and 600 billion feet additional in culls and second-growth stands. Seventy-five per cent of the remaining virgin timber is west of the Great Plains, and more than fifty per cent of all our remaining saw timber is in the three Pacific Coast States.

"The ultimate goal of timber growing is a nation-wide extension, region by region, of what has already been attained on private lands in limited parts of the Northeast and in the administration of the National Forests, namely a sustained yield of forest products, an adjustment of forest-using industries to the growing capacity of the lands which supply them, a balance between timber production and timber use.

"Before the war Germany was producing fifty cubic feet to the acre of forest land; France thirty-six feet an acre. We must grow at least forty-eight cubic feet an acre to meet our present requirements. This rate of growth can be attained if the art of timber culture is thoroughly developed by research in each important forest region, and applied by demonstration on public forests and an aggressive campaign of education to reach the private owners of forest land."

On the slopes of the Cascades, the Coast Range and the Olympics of Oregon and Washington still stands the forest of Douglas Firs, with its acreage of 54,000 square miles of growing timber. It is ready to do its share toward supplying the sinews of industry and to answer the call of the home-builder. In the state of Washington alone there are today more than 300 logging camps and 800 sawmills daily cutting, sawing and shipping their product all over the country. New plants are continually being erected and established mills enlarged. Heavy machinery of the modern type is rapidly being installed to take the place of man and horse power, that the nation's need for timber may be supplied. The leviathans of the forest are ready for the service of mankind.

Jewish Boy Sent to Prison for His Religion

Amazing Story of Racial Persecution in New York; Sixteen-year-old Boy Defeats Attacks of Rabbis and Lawyers; But Court Sends Him to Prison

IS IT possible to jail people in the United States because of their religion? It is not only possible, but has been done. On the writer's desk lies the bound transcript of a court case inscribed—"Kings County Surrogate's Court. Matter of Guardianship of Harry Bucalstein." This means, plainly, the Court of Honorable George A. Wingate, Surrogate, at Brooklyn, New York.

Harry Bucalstein, now nearly eighteen years old, was born in Russia. He attended a Jewish school, an institution where the children go early in the morning and remain until night. In the year 1913 his family came to the United States, settling in Abingdon, Illinois, removing from that place to New York in 1920. In Abingdon, disliking to associate with the Jews whom he found there, the boy attended the Rev. Dr. Bollinger's church, the First Methodist, where he heard an exposition of Christian doctrine.

Q. "Did your parents know about your attending church?" A. "They did and they encouraged it." Q. "Who encouraged it?" A. "My father." Q. "What did he say?" A. "He said it would do me good to watch the various insane beliefs that people had."

In New York the boy fell into temptation. Sent out to collect some bills, he ran off with $17.80. This act made Harry Bucalstein an outlaw, at least in his own conscience. It gnawed upon his mind day and night. On the streets of New York one October night in 1921 he heard a voice shouting above the din, "Repent, repent, and believe the Gospel." Moving to the circle of people he saw a street speaker, a Jew, who was preaching the Christian Gospel. The speaker was Rev. Charles Wiesenberg, a minister of the church known as the Disciples of Christ, and superintendent of the Washington Heights Mission.

The Beginning of the Boy's Trouble

THAT night began one of the strangest stories ever spread upon the records of an American court. The boy went to Dr. Haldeman's church and Dr. Holloway's, attended the "John 3:16 Mission," the Washington Heights Mission, and other religious places. November was a month of uneasiness for him, a new uneasiness added to the mental discomfort caused by his theft. In December, face to face with the need of restitution if he would start life anew, he confessed his theft to Mr. Wiesenberg. The man from whom he had stolen was a Jew. The man to whom he confessed was a "converted Jew," called by the Jews a "renegade." But forthwith the Jewish Christian took the boy to the Jewish employer, a Mr. LeGlaire, who proved to be a considerate, kindly man. He was ready to forget. He refused to take the first payment offered him by Mr. Wiesenberg on the boy's behalf. Satisfactory arrangements were made for Harry to pay back the debt at $1 a week, and the confidence placed in the boy was warranted. He continued to work and pay until arrested and thrown into jail—for being a Christian.

For with his theft confessed and restitution arranged, Harry was baptized on January 8, 1922, by Rev. Edward S. Holloway, of the Wadsworth Avenue Baptist Church, New York City.

What followed for the boy, as told on the witness stand, will not be reprinted here, because it concerns his mother. The curses and tortures and dark ecclesiastical objurgations and incantations make a moving story. "She said all Jews who became Christians should be killed," said the boy. "Their hands and feet shall be broken. Then she ran toward me with hatchet upraised. She did not bring the hatchet down. I stood perfectly still. Then I took my hat and went out. I rode on the subway all night."

Now, under Jewish law, a boy is free at the age of thirteen. He is said to have reached the age of religious responsibility. It is his Bar Mizwah. Harry Bucalstein was nearly sixteen when he made his choice.

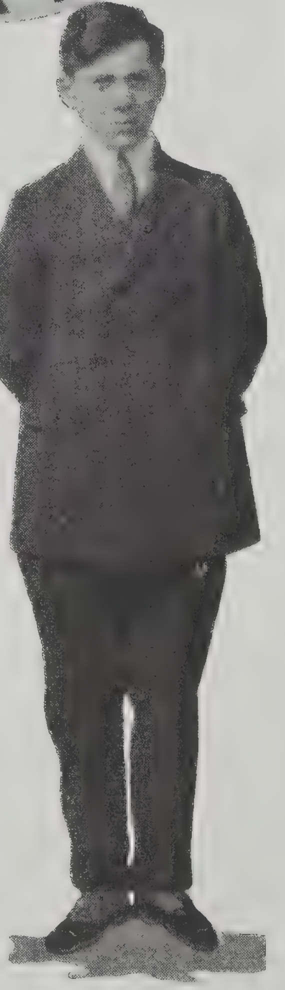
Arrested for Becoming a Christian

ON JANUARY eighth he was baptized. On January sixteenth, he was arrested on the street. The charge was "disorderly child," brought under the statute of New York City which provides that "all children actually or apparently under the age of sixteen who desert their homes without good or sufficient cause shall be deemed disorderly children." Harry had "deserted" his mother's home to go to his sister's home.

Four weeks passed in custody. Justice Wilkins, of the Children's Court was ready to let the boy have his chance, but not so "The Jewish Big Brothers' Association of Brooklyn" which was now in the case. It might be impossible to prove crime against the boy, but maybe he could be shown to be insane. This struck a new fear to the hearts of Harry's friends. It was not the first time that converted Jews had been disposed of via the asylum route. What the boy tells of efforts to work upon his nerves will not be repeated here. But he came off triumphant, a five per cent demerit mark being given because his head was filled with "religious ideas." Imprisoned with the worst classes of young criminals, he held meetings and read his Bible to the other boys.

The alienist having passed the boy, the next hope of punishing him was prison. Liberated from the Children's Court in the custody of a Jewish probation officer, the boy's path was difficult enough, but it was the court's order that he should sleep at his mother's house, and he did. Every night the words of the ancient Jewish curse were pronounced over him, he testified. They brought him before small gatherings that questioned and hectored him. A New York public school room was used for one of these inquisitions. In May the pressure upon him became so strong that he broke his parole, was remanded to the Children's Court, and was certainly on his way to prison (where he afterward landed) when friends took up his cause.

The trial was precipitated by his friends applying to the court for the appointment of a guardian over him. The applicants, of course, took the position that Harry Bucalstein was being persecuted because of his religion; the Jewish Big Brothers' Association, with three lawyers and two rabbis assisting the cross-examination, took the position that the boy was unruly and should be punished. The case was heard by Surrogate Wingate.



HARRY BUCALSTEIN,

The young Jewish boy who baffled the rabbinical and legal inquisition told on this page.

What was behind all the legal phraseology may be seen from the testimony of Theodore Teitch, an engraver, who testified that he was a Jew and that he belonged to no Christian society. He was asked how he came to a knowledge of the case.

"Mrs. Teitch told me that Mrs. Bucalstein is having some trouble with her boy. And I asked her just what the trouble was and she told me that she is wishing that someone would aid her in some way or other to commit Harry Bucalstein to the Blackwell's Island for becoming a Christian. She told me that he was a very good boy. 'And how is he now?' And she told me that he is much better toward her as he was before, but she didn't want to have any Christian in her family. Whereas I answered her, 'I would rather see the boy be a good Christian than a bad Jew.' And she further asked me if I would go to a rabbi of Brooklyn for the boy to bring him back to his first belief. And I told her I am not going to no rabbi before I see the boy myself. And the next day he came, with the consent of his mother."

Q. "Came to your place of business, did he?" A. "Yes, sir. And I spoke to him about this matter and said to him, 'Why did you change your belief?' and he answered me, 'I have not changed my belief at all but I have fulfilled the promise of God.' I asked him to show me how right he is, that he has fulfilled those words of God, and he has shown me many chapters of the Torah, has shown me in the Psalms of David, and he has convinced me through a firm belief that Christ Jesus is the suffering Messiah of the Israelites."

But the shrewd Jew was not to rest only on words. He gave Harry $200 to go and pay a bill. The boy came back with the receipt. Then he sent him to carry $1,000 worth of jewelry through the streets. It came safely. That settled Mr. Teitch.

The Jewish lawyers against Harry tore into Mr. Teitch like lions.

Q. "Why are you interested in this case?"

A. "I am interested in this case because I know that Harry Bucalstein is absolutely innocent to be brought up here or to any court to put him away until he is twenty-one years of age for his religious belief."

Q. "Do you mean to sit there and tell me and tell this court that you as a Jew down in your heart come here voluntarily to testify to the fact that you want to see this boy's religion changed?"

The Surrogate—"The witness has not testified to any such thing."

Q. "What prompted you to test out Harry Bucalstein?"

A. "To see whether Christianity makes worse or better."

Q. "Why are you interested in Christianity?"

A. "Because I am a Jew."

Q. "Will you please explain to me why as a Jew you should be interested in seeing whether Harry Bucalstein after he became a Christian was a better boy or not?"

An Intelligent Jew Gives His Opinion

A. "I was told also when I was young that Christian people are not reliable, were murderers, and I have the same opinion all the time until I read a few passages of the Old and New Testament, and I have seen the action of Christian people, and I have found in my opinion that it is not so. Nor does it say in any part of the Old Testament whether Christian people ever existed at that time, but the Bible does say that there will come a day when there will be a new name of people as we have never heard of before, and I have been brought to this conclusion, that it is the Christian people, that they are the real people that God has said of this name."

Q. "You have formed a conclusion now that the right religion is the Christian religion?"

A. "I am talking———"

Q. "Yes or no, please."

A. "No."

That will suffice to show what was the real motive behind the prosecution of Harry Bucalstein. But before passing this phase, salute Mr. Teitch as a modern Gamaliel. Would that his justice of mind were more widely found.

"The Jewish Big Brothers' Association" claimed that the boy was not old enough to decide for himself what religion he should take up. Their suggested assistance was that he be given a jail term to think it over. In court they were allowed to examine him up and down and across the whole field of theology, Jewish and Christian. Four lawyers and a lawyer rabbi were pitted against him in one of the strangest examinations ever held in a court room. And at the end of one very long and fierce contest the lawyers confessed themselves worsted and asked to be permitted to bring in more expert cross-examiners. Bucalstein's attorney objected. "It seems to me, if the Court please, that the Jewish counsel who has been examining him, a very able attorney, should be quite the equal of a sixteen-year-old boy in such a test."

The Surrogate—"Without wishing to affront that counsel in the slightest degree, I think you flatter him unduly."

The Boy Goes Under Legal Fire

SO THE examination was started again, this time by a rabbi-lawyer, Samuel Buchler.

Q. "How many hours did you spend in the Hebrew School?" A. "I believe from after breakfast until some time we fell asleep over our books."

Q. By the Surrogate—"At what hour?" A. "About nine o'clock in the evening."

Q. (continued by the rabbi)—"How did you renounce your Jewish religion when you were baptized?" A. "I didn't renounce the Jewish religion when I was baptized."

Q. "If they wanted to ask you to renounce the Jewish religion you would have refused?" A. "They did not ask me that." Q. "Would you have refused?" A. "I don't know. They never asked me that, so I can't say." Q. "How then did you accept the Christian faith without renouncing the Jewish faith?" A. "I did not have to renounce it."

Q. "You say you have not renounced the Jewish faith. Do you consider yourself now a Christian or a Jew?" A. "I consider myself now a Christian. I never was a Jew."

Q. "Until that time you were a Jew?" A. "Until that time I was a Jew of the Tribe of Levi. That is why you can't call me a Jew."

Q. "Were all your family descendants of Levi?" A. "All my father's brothers and ancestors were. My mother is not. She is an Israelite." Q. "And if any one was to ask you whether you were a Cohen, a priest, or not, what would you then say?" A. "I would say I was." Q. "Do you believe, young man, that you can be a Jewish priest and at the same time a Christian?" A. "I do."

Q. "Now, at the present time, do you go to any church?"

The Surrogate—"No. He is locked up; he is in the custody of the law."

Q. "You never heard of anyone turning from Jewish to Christian for gain?" A. "No, sir, nobody has ever done it. That is one of their claims but it is not true."

Q. "May I ask whether you are circumcised?" A. "I am a circumcised Hebrew. The first person that was circumcised was not a Jew, for he was Abraham, and Abraham was not a Jew, he was a Gentile."

The young man was very insistent on this distinction between Jews and Israel. In a brush with the lawyers on the same point he apparently piqued their interest, for they questioned him closely.

Q. "What do you think your father was?" A. "He was, according to the synagogue, a Cohen (priest)."

Q. "Was he a Jew?" A. "He was a Levite."

Q. "What were you at your birth?" A. "At my birth I was a Hebrew of the Tribe of Levi and a priest after the Order of Aaron."

Q. "Will you try to differentiate to me the difference between a Hebrew and a Jew?" A. "A Jew is a descendant of the Tribe of Judah, one of the twelve sons of Jacob. A Hebrew is a person who is a descendant of Abraham who was a Gentile."

Q. "What is a Christian?" A. "A Christian is a follower and worshiper of Jesus Christ the Son of God."

Through the whole range of doctrine, lawyers and rabbis led the boy. Now they were hammering him with the commandment, "Obey thy father and thy mother," and he was coming back with the New Testament form—"Children, obey your parents *in the Lord,*" always emphasizing the last clause. Now he was stumping his questioners with recitals of strange libels on Christ from the Talmud and the traditions. Again he was trying to explain that no man converted him to Christianity, and no one even invited him to church, but that it was wholly the work of the Holy Spirit that led him into the faith which he repeatedly described as the flowering and fulfillment of Judaism. He was only agreeing that Messiah *had* come, and for that they were not only casting him out of the synagogue, but were seeking to put him into jail. Very bitterly did they rail upon this boy at times, but only once did bitterness escape him, which was, when he referred to the operations of a certain firm of Jewish lawyers. His mother was called and asked, should he be allowed to go home, would she permit him to read the Bible.

Q. "If your son wishes to read the Bible at home, will you oppose it?" A. "No, I will not allow it."

Q. "Would you allow your son to go to Christian lectures to study for the ministry?" A. "No, I will kill myself."

The Dark Traditions That Still Exist

THE mother compels sympathy. Her view of the step her boy had taken may be understood when it is known what these poor people are told concerning the Founder of Christianity. Here is a passage from the boy's testimony on this point. He is being cross-examined by a Jewish lawyer who, though hammering him for several days in court, has failed to defeat him, and the boy says:

"They tell the story that Jesus was not crucified, but on the contrary that he really was a (fatherless one) and that he stole from one of the holy books in the temple a certain word which he sewed in the calf of his leg, and by the power of that word was able to fly, and so many people believed him to be God. Several rabbis decided to stop him, so they also got a holy word and flew higher than he did and dropped something on him and so caused him to fall and be killed. There is also another story stating that he was killed by throwing cabbages at him."

Q. "Tell me who told you about these traditions and stories or what books you read that give you what you have just testified to." A. "I received one story, that flying story, from a rabbi, and from Mrs. Greenberg, whose father was a rabbi and whose son is a rabbi. She was trying to reconvert me when she told me that story. And the other story I got from my mother when I was a little baby."

Q. "And you remember that story very well?" A. "I do. It has been told me many times since."

A Psychological Condition Described

IT IS little wonder, then, that Harry Bucalstein's mother should be perturbed that her son had succumbed to such a religious delusion as those stories represented Christianity to be. But there are great hopeless tracts of darkness in the Talmud and the Traditions which bind grievous burdens on the minds of multitudes of Jews, even here in America.

Charles S. Nyman, a Jewish probation officer of New York, did not fully explain why he was in charge of a boy from Brooklyn. But such was the case. It was the first time he had ever been put in charge of a boy from Brooklyn and the first time he had ever had charge of a Jewish boy who was guilty of turning Christian. He did testify, however, that he was interested in the "Jewish Big Brothers' Association of the Bronx." No special prejudice can be charged against Mr. Nyman, although he did exert his influence to have the boy incarcerated at a time when the boy's fight for liberty was at its most critical period. However, in giving the boy's story, Mr. Nyman presented a passage which may have psychological value for the student of comparative religions:

"I asked him, 'What occurred in the meantime?' He stated, 'I walked about the streets at different times. That one evening about eight p. m. I reached a point at Thirty-sixth street and Eighth avenue at which time I came across a meeting conducted by some mission. I listened. I became interested.' I then questioned him, 'Is this the first time you became interested in that sort of work or were you directed by any particular person to go there?' He told me that it was just by accident that he came across this particular meeting. 'What occurred?' He told me that a little while after the meeting, 'about eleven o'clock when it broke up I began talking with some of the persons interested in connection with that meeting.' 'Anybody in particular?' He mentioned at that time, which, of course, was new to me, the name of Wiesenberg. 'What happened after that?' He told me, 'For the first time after talking to them on the matter of my status so far as being away from home and not working, that they interested me to go with them so that they will give me proper care and attention.' I questioned him along the line to find out why he didn't want to go home. He told me that 'I did not want to go home because I didn't have the heart to confess to my stealing from the Duo Sales Company.' 'Did you finally confess?' 'Only after I found out that a Jew can't confess and will not confess.' I asked him how and why does he make such statements when he had no particular reason at that time to state. He told me that, 'When I became interested in the mission they told me for the first time about confessing as a Christian, I am in a position then to relieve myself of the worry and thought of being a thief.' 'Did you confess?' 'Yes.'"

To those Jewish religious leaders who insist that Judaism cares more about social or national morality than about "individual salvation," the predicament of this boy—as a spiritual condition—should present another element for consideration. While there is a certain nobility implied in the position stated by so high an authority as Leon Simon as being that of Judaism—"For Judaism has no message of salvation for the individual soul, as Christianity has: all its ideas are bound up with the existence of the Jewish nation" ("The differentia of Judaism" says Achad ha Am, "is its objectiveness, its rejection of the personal")—still, here was a boy who for the time was at an individual, a personal crisis, and his complaint is that he found no help among his people. And, after all, the help which he did find at the mission was as much according to nature as to the Christian religion.

The hearings wore on. More than 500 typewritten pages are filled with examination and cross-examination. In addressing the court in the boy's behalf, Attorney Edwin Welling Cady said, among other things: "The boy has already chosen his own religion. We claim he had a right to do that . . . .There was constant interference with his exercise of his religious education, and then there were the Children's Court proceedings . . . .A blot is placed against his name without any real offense . . . . It is not a case of the court having to decide the merits of two different religions . . . . On the one hand there is the question of the boy going to the House of Refuge. That seems a sad thing, in view of the possibilities of the boy and his abilities. And on the other hand there is protection, there is opportunity, there is a way for him to achieve his call."

Prison—Weeping—Release

THE protection referred to was the offer of Rev. Dr. Holloway to stand as the boy's guardian.

On June 27, 1922, the Surrogate closed the case saying: "I will reserve decision." His decision was a refusal to appoint a guardian for the boy, and thus the case went back to the Children's Court. Judge Wilkins, of the latter court, sent the young prisoner to Randall's Island, the penal institution for incorrigible children, for an indefinite term. The attorney for the "Jewish Big Brothers' Association" actually said "Thank you" to the judge upon pronouncement of sentence.

The boy, thus sentenced, knelt in the corridor of the court room and prayed for his mother. When the prison officials marked his clothes with his prison number, he wept. Yet his conduct was so exemplary that he won the esteem of Colonel Barber, the superintendent, and the respect of the inmates.

For six months this boy remained in prison. But the case was too flagrantly one of religious persecution, and presently an influential person was interested whose intercession procured the boy's release. Harry Bucalstein is now studying to be a missionary to those people among whom he was reared.

The case, while not without parallel, shows what is possible for organized groups to achieve in the United States.

From Coined Silver and Gold to Bank Ledger Credits

The Gradual Evolution of the American Monetary System

By H. L. LOUCKS

IN 1786 Congress chose as the money unit for the United States the coined silver dollar of 375.64 grains pure silver.

This was changed in 1792 to 371.25 grains of pure silver.

Again in 1878 the weight of the silver dollar was changed, and it was deprived of its full legal tender quality by an amendment "except where otherwise stipulated in the contract" and soon thereafter, the lenders began stipulating in the contract the clause "payable in gold coin."

In 1792, the coined gold dollar containing 24.75 grains of pure gold was also made a legal tender, giving us the double standard at the ratio 15 to 1, with the free coinage of both metals.

In 1834 the weight of the gold dollar was reduced to 23.2 grains of pure gold, making the ratio 16 to 1.

In 1837 another change was made to render the commodity value of the silver and gold coins uniform, in accord with the world market value of the metals, and so the amount of pure gold in the dollar was reduced to 23.22 grains of pure gold.

You will note that it was the gold dollar that usually needed fixing and changing.

These changes were explained by the necessity of preventing the exportation of either metal. The Fathers knew nothing of the terms "deflation" or "inflation," and were not afraid of having too much of their own legal tender money in the country, or in circulation.

But, silver continued to be the popular money abroad as well as at home. So, in 1853 the legal weight of the minor coins was reduced to discourage their exportation, but to satisfy the other side the legal tender quality was limited to five dollars, and the right of coinage was reserved for the government, the beginning of a profitable source of revenue from that source.

In 1873 the gold dollar was made the standard and the trade dollar of 420 grains—an increase of forty-nine grains of silver—was authorized. It was intended for circulation in oriental countries as a substitute for the Mexican dollar, which it slightly exceeded in weight.

The peculiar thing about this act was that although the dollar contained forty-nine grains more silver than our legal tender dollar, its legal tender in the United States was limited to five dollars, and even this limited quality was withdrawn by Congress July 22, 1876, and the coinage was limited to such amount as the Secretary should consider sufficient to meet the export demand.

The act of February 19, 1887, provided for the retirement of the trade dollars and their recoinage into standard silver dollars, or subsidiary silver. The following official order is really amusing. "For six months after the passage of the act they could be exchanged at the Treasury, dollar for dollar, for standard silver dollars, or subsidiary coin." That is, the Secretary of the Treasury was authorized by Congress to give you 371 grains of silver in exchange for 420 grains. Further coinage of the trade dollar was prohibited.

Giving too much silver for a dollar! Think it over. On its merits the gold metal could not compete with silver for monetary use, at home or abroad.

In the elimination of the silver dollar, they accomplished a material part of their main object; the contraction of our legal tender Honest Money, and limiting our one and only standard by which to measure the scarcer metal, gold. This cleared the way for a complete monopoly of gold in the United States.

Since the enactment of the law making the gold dollar the "standard unit of value," all financial obligations, municipal, state, and nation, as well as individual, industrial and commercial, have been made payable in United States gold coin, and soon thereafter, with renewed zeal, began the withdrawal of gold coin from circulation and rushing it to the melting pot at the assay office, to be stored in the vaults as gold bullion.

This destruction of gold coin really began as far back as 1882, when a law was enacted authorizing the Secretary of the Treasury to issue gold certificates in exchange for gold coin stored in government vaults. The reason given to the public was "a saving of gold by abrasion, and in transportation charges," which seemed quite logical.

This was followed in 1911 by providing for the issue of gold certificates against the deposit of gold bullion, or foreign coin to the full extent of one hundred per cent. This was clearly a case of basing currency, an obligation of the government, on a stored product of labor, that never had been coined, and which never intended to be coined by our government.

As proof of the foregoing we submit the following taken from the annual report of the Director of the Mint for 1922—Page 17.

For the four years prior to the enactment of the Federal Reserve law, the average annual coinage of gold was $117,980,714.

For 1912, the year following the enactment, but before the law had been put in operation, there was only $12,749,090 coined.

For the fiscal year 1922, the total receipts of gold coin and bullion at the assay office was (page 17) $546,695 484, and (page 89) the total coinage—$53,000,916.

For the eleven years since the enactment of the Federal Reserve law, the total receipts at the assay office were $3,040,074,874. And the total coinage was $212,264,402.

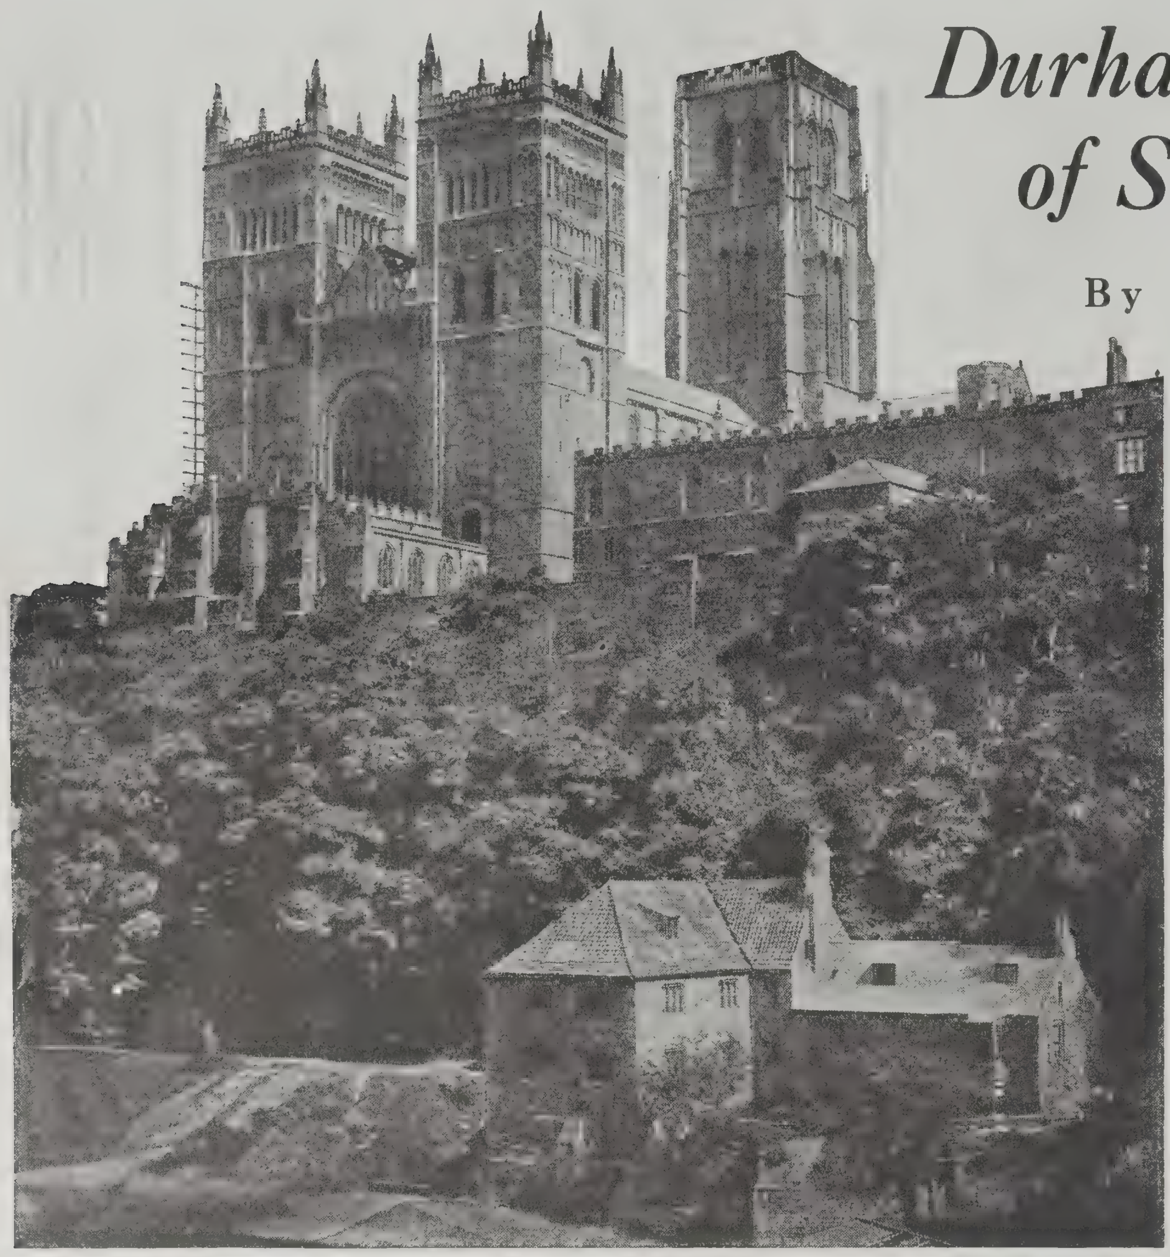
Think for a moment of the inevitable result of every great nation in the world piling up unlimited promises to pay in one certain commodity and every grain of that commodity stored in the vaults of a comparatively small group of international bankers whose sole aim in life is the accumulation of interest-bearing obligations.

OUR GOLD JOSS.

The heathen Chinee has the satisfaction of seeing, or feeling his gold or silver idol. The East Indian enjoys the hiding of his gold or silver until needed. We, the most intelligent people on earth, have made an idol of a gold dollar, that we cannot see, feel, produce, nor find, except with a "jimmy" in the secret vaults, in the twelfth basement down, on Wall Street, New York.

Durham, Resting Place of Saint Cuthbert

By PAUL TYNER



The southwest front of Durham Cathedral.

Grandeur of Norman Architecture Revealed Nowhere So Wonderfully as in English Cathedral Built on Command of William the Conqueror

THE County Palatine of Durham is famous for its cows and its collieries and as the place in which the world's first railway was built and operated; but above all it is famous for Durham Cathedral. Nothing impresses the American sojourner in England more than its ancient cathedrals and abbeys. They have distinctly the charm of the exotic for we have nothing like them at home. Each has its own special character and interest, beginning with Westminster Abbey in London and passing on through the storied fanes of Canterbury, Ely, Exeter, York, Salisbury, Winchester, St. Albans and Rochester. But none is more impressive or embodies more the spirit of Medieval England and its development in successive modifications through the centuries than does Durham Cathedral. Crowning an elevation rising steeply in the valley of the Wear, it seems to spring naturally from this rocky promontory. It challenges the sky and dominates the wide Northumbrian plain, so that it is visible for miles from all sides. Nowhere is the grandeur of Norman architecture more splendidly represented; in the whole range of European edifices there is nothing that impresses the beholder with so peculiar a sense of solemn majesty in its combination of strength and simplicity.

Durham Cathedral's central tower rises 218 feet and the two western towers that flank it are each more than 146 feet in height, while the total length of the cathedral is about 502 feet. The external breadth of the whole church across the transepts is 193 feet, being eighty-one feet across the nave. The great arches in nave and choir rise to about thirty-three feet nine inches. These dimensions convey some idea of the perfect symmetry of its proportions. William the Conqueror is responsible for the initiative that ordained the creation on so uniquely commanding a site of a structure embodying the ripest architectural genius of Normandy.

Unlike the Abbey at Westminster and Notre Dame in Paris, the interior of Durham Cathedral more than fullfils the promise of its splendid exterior. Under its lofty groined roof one seems to wander as in a world apart. The dim religious light is mellowed by the radiance of priceless stained-glass windows—the great rose window in the east especially marking the harmonious lines that tell where meet the lofty walls and springing architrave of the roof.

Cathedrals are unlike most modern buildings in that they are of slow growth, each addition taxing successive architects with the problem of harmonizing the new with the work of their predecessors. Durham is distinctively Norman, taken as a whole, yet it assimilates in two of its marked features charming examples of English-Gothic creation. The first is the Galilee Chapel at its western end, originally the "Lady Chapel" which was designed to occupy the usual place at the eastern end. The reversing of this order involves one of the many traditions that give a supernatural tinge to Durham's story. In 1175, Hugh Pudsey, then Bishop, began the building of a Lady Chapel at the east end of the choir, in place of the original apsidal ending. But the new building had not progressed very far when great cracks appeared in the walls. The pious bishop, taking this as a sign of displeasure on the part of God and St. Cuthbert, had the incomplete structure pulled down and utilized the materials in building what is now the "Galilee Chapel" at the west end. The forest that was "God's first temple" is vividly suggested here. Even the ordinary babbling tourist is awed to silence in the glorious shrine, as nature hushes and cools the human fever in cool green woods.

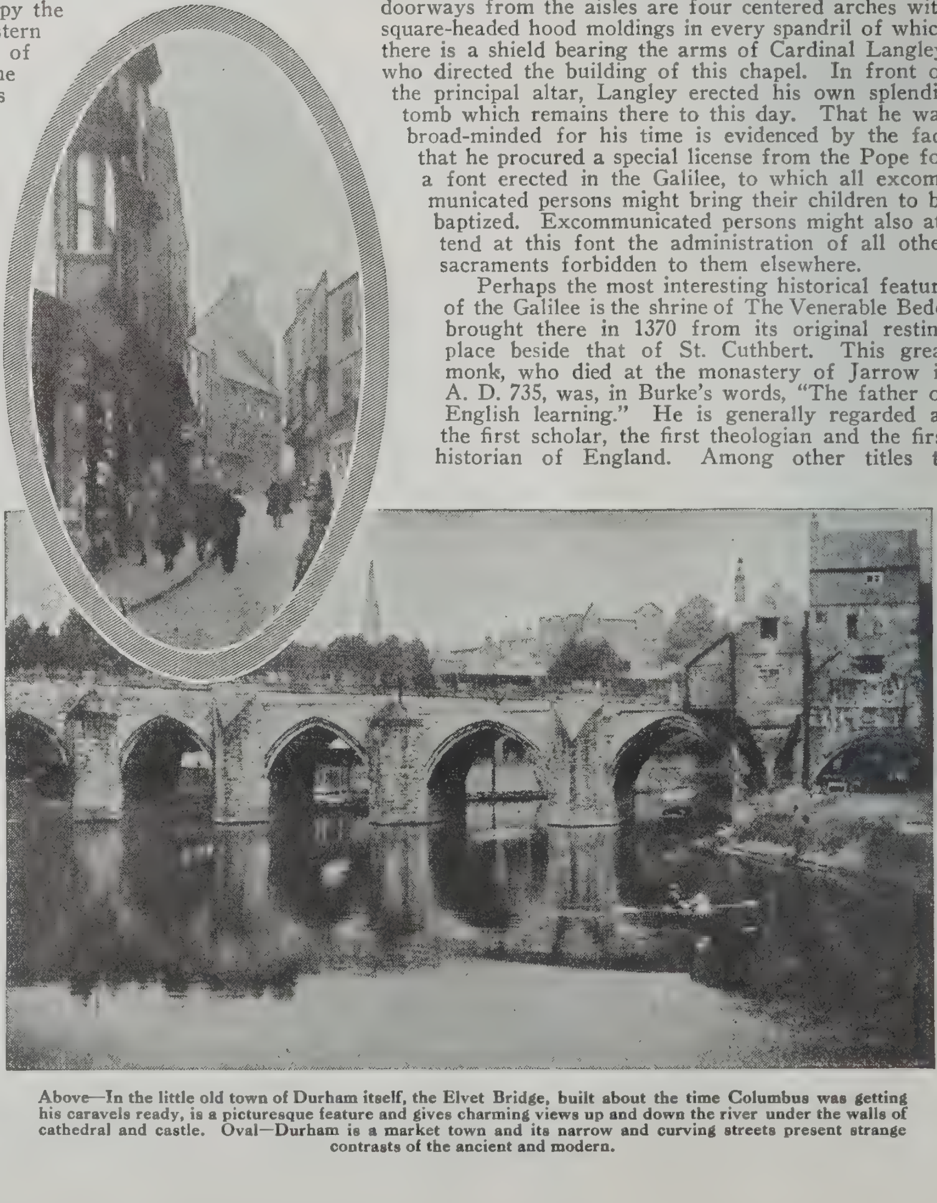
From the line of Frosterley marble, beyond which in the monastic days no woman was allowed to pass, one may walk through the vast nave to find a western bench within view of St. Cuthbert's grave. Resting there the full sublimity of the scene sinks into one's mind and heart. So resting, certain reflections are irresistible. Here was a splendid fabric which, enduring for nearly a thousand years, has perpetuated the architectural and engineering genius, the piety and the ecclesiastical pomp of an age of great builders and of a mighty church militant all concentrated on the shaping in stone of a house of prayer. Yonder at Newcastle-on-Tyne, half an hour away, were mighty furnaces and powerful engines or marvels of machinery in the making, great steel bridges and gigantic ships going and coming from the ports of the seven seas. Here is the frozen music of a Gregorian chant in stone, shrines of saints, forests of stately columns lining a great nave, its sculptured arches and transepts, stained glass, and over all the hallowed memories of men and deeds of a past already hoary when Columbus discovered America. One is reminded of the words of an Oriental pundit. "You Occidentals," he said, "boast of your great railways and steamships and factories, your banks and office buildings, and of your triumphs in harnessing the electric current. How comes it that in centuries you have not added a single great cathedral to those in which the soul of Europe expressed itself during the Middle Ages?"

The implied criticism seems to be a superficial one. Markedly, here in Durham, the material side was emphasized, the County Palatine in which the bishops exercised temporal as well as spiritual rule and maintained armed forces for offensive as well as defensive warfare over keenly contested material rights and privileges, where streets ran with blood in fights between the rival claimants to the bishop's throne and where monks and canons battled with great candles from the altars. Who shall say that, in so far as the modern fabrication of railways, steamships and skyscrapers in our own day go to serve humanity and enhance the general well-being, these things are devoid of spiritual significance? No! much as the splendor of these old cathedrals may impress us with a sense of the sublime in architectural form, and mass, there is no need for modern man to abase himself before them. The march from the grand cathedral to the grand steamship or factory *does* spell progress.

But we must not let these reflections take us too far afield.

Coming back to the first transept which marks the transition from Norman to early English Gothic in plan, the Galilee consists of five aisles divided from each by arcades, each of four arches resting on marble shafts, their capitals carved with the characteristic volute. A recess on the north contains the altar to "Our Lady of Pity," one in the south to "The Venerable Bede." The doorways from the aisles are four centered arches with square-headed hood moldings in every spandril of which there is a shield bearing the arms of Cardinal Langley, who directed the building of this chapel. In front of the principal altar, Langley erected his own splendid tomb which remains there to this day. That he was broad-minded for his time is evidenced by the fact that he procured a special license from the Pope for a font erected in the Galilee, to which all excommunicated persons might bring their children to be baptized. Excommunicated persons might also attend at this font the administration of all other sacraments forbidden to them elsewhere.

Perhaps the most interesting historical feature of the Galilee is the shrine of The Venerable Bede, brought there in 1370 from its original resting place beside that of St. Cuthbert. This great monk, who died at the monastery of Jarrow in A. D. 735, was, in Burke's words, "The father of English learning." He is generally regarded as the first scholar, the first theologian and the first historian of England. Among other titles to



Above—In the little old town of Durham itself, the Elvet Bridge, built about the time Columbus was getting his caravels ready, is a picturesque feature and gives charming views up and down the river under the walls of cathedral and castle. Oval—Durham is a market town and its narrow and curving streets present strange contrasts of the ancient and modern.

The choir and chancel looking west. The Bishop's throne and choir are on right. The altar is in the foreground. The marble screen is beautiful in itself but is criticized as breaking the vista of the lofty nave.

distinction, he was the biographer of St. Cuthbert, of whom he had long been a devoted and loving admirer; so there is a poetic fitness in their being associated in death as in life. Camden relates the story of a French pilgrim, a bishop, visiting Durham on his way from Scotland. When brought to the shrine of St. Cuthbert he knelt, and after his devotions laid an offering of a penny on the shrine, saying: "St. Cuthbert, if saint thou art, pray for me!" Afterward, saying his orisons at the shrine of The Venerable Bede, he laid on it an offering of a French gold crown, saying: "Saint Bede, because thou art a saint, pray for me."

The second of these early Gothic English features is the Eastern transept, usually called the "Chapel of the Nine Altars," whose construction was begun in 1242 under the episcopate of Bishop Nicholas de Farnham, although projected by his predecessor, Richard le Poore. This part of the cathedral is a transept of three bays, the central one being narrower than those on the north and south, which are of equal dimensions, each bay being divided into three compartments. The floor is sunk four feet below that of the choir and two feet eight inches below that of the aisle. This gives the greatest possible conception of loftiness in the chapel, while meeting the need of maintaining one uniform height in the vaults throughout the church.

How the site of Durham Cathedral came to be selected is a curious story. During a threatened invasion by the Danes in the spring of 995, Bishop Faldhune of Chester-le-Street, with the congregation of St. Cuthbert, fled to Ripon, carrying the body of St. Cuthbert with them. A few months later peace was restored and the bishop and his people with their precious charge turned homeward to Chester. Arriving at a place called Wardley, says the veracious chronicler, the vehicle carrying the shrine which contained the saint's body could not be moved farther. The most vigorous efforts proved uneffective—the cart continuing immovable as a mountain. The circumstance was taken to indicate that St. Cuthbert refused to be reconducted to his former place of residence. The bishop and his followers were nonplussed, for the spot where they were stopped was in the middle of a then uninhabitable plain. The bishop called on the people to solicit an explanation of this sign from heaven by fasting three days and spending the time in watching and praying. This done, it was revealed to a certain pious person named Gadmer that they should move the body to Durham and there prepare a fitting resting-place for it. On the announcement of this revelation they joyfully returned thanks and were now able to move the shrine which had resisted their efforts before. Still they were distressed because they had no idea where Durham was! Lo! Another miracle! As they went along, they heard a woman call to a neighbor to know if she had seen her cow and the neighbor answered with a loud voice that the cow was in Durham. "A happy and heavenly echo to the distressed monks, who thereby soon arrived at the end of their journey."

This legend is supposed to be referred to in a sculpture on the outside of the Chapel of the Nine Altars, although the historians of Durham contend that the carving was representative of the wealth of St. Cuthbert's Church, in accordance with the adage. "The Dun Cow's Milk makes the prebends' wives go all in silk." But Canon Greenwell prefers the picturesque old legend which has long been the theme of a favorite North Country song, "The Dun Cow."

The connection of William the Conqueror with Durham began in a curious way. Late in the year 1069, the saint's body having rested undisturbed in the Saxon church since its dedication by Bishop Faldhune in 998, news of the Normans' approach alarmed the Congregation of St. Cuthbert and again they resorted to flight carrying the body of the holy father back to Lindisfarne. After four days' journey, it is recorded that the waves receded in a miraculous way to give them passage on dry ground from the mainland to the island. Early in the following year (1070), they returned to Durham and once more deposited the body in its shrine. Three years afterward, King William, on his way south from Scotland, came to Durham. He had heard much of the great saint of the North, but was skeptical as to the body being really at Durham. Although everyone connected with the church declared on oath that the saint's body rested there, the king determined to settle the matter for himself with the assistance of several abbots and bishops in his train. He announced that if it were found he had been deceived, all the nobles and older people of Durham should lose their heads.

But the royal investigation was not carried out—for while the bishop was celebrating a preliminary mass, the Conqueror suddenly became very ill. He rushed from the church, leaving a splendid repast, mounted his horse and did not cease to urge him to top speed until the river Tees was crossed. That the king was impressed may be gathered from the fact that shortly afterward he sent from London to Durham a company of Benedictine Monks under orders to build there the most splendid cathedral in the kingdom. It was not until 1104, however, that, under Ralph Flambard, the third Norman bishop of Durham, the building of the cathedral and monastery, begun under his predecessor, William de St. Carileph, was completed and the saint's body removed to a new and splendid shrine constructed within it.

When the king, Henry VIII, at the Reformation in 1541, suppressed the monasteries and confiscated the church property, the Shrine of St. Cuthbert was destroyed, and tradition relates that the body was found intact nearly 1,000 years after the saint's death. The king's agents were so struck by this phenomenon that they carefully put the body away in the vestry until the royal pleasure should be known. In accordance with Henry's orders, the body was shortly after buried in the ground under the place where the shrine had stood. However, when the saintly remains were next exhumed, in May, 1827, only the bones were found intact. The marble slab indented with the kisses of centuries of supplicants was relaid over the grave where it remains to this day.

Lasker Influence Still Rules Shipping Board

Concluded from page 6

Orth consented, apparently seeing any other course in the matter futile—whereupon Mr. Lasker is said to have dictated telegrams to Farley and Freund to "come back" because the matter had been satisfactorily adjusted. They came back "into town" right away.

On August 18 the Shipping Board received another bid through Lasker—at least he is said to have delivered it to the board—although the bidding on the ships had been closed and offers opened July 30, and although a bid had been accepted, properly certified, and delivered to the successful bidder.

When Mr. Lasker and Mr. Schlesinger started to have the board act favorably on the new bid, which was for $2,400 a ship, and was from Fleischhacker agents—Commissioner Plummer and some other members of the board raised a row. The ships were sold and the board had ratified the sale, said they.

Whereupon Mr. Lasker and Mr. Schlesinger, "consistent with good business methods," declared, it is said, that the contract could be filled so full of "fishhooks" the New York Ship Construction & Trading Company could not carry it out.

A complaint in a later suit alleges that Mr. Lasker sent a telegram to San Francisco for certain agents to come on East immediately.

Several contracts had been prepared by Mr. Freund—each filled with "fishhooks," Orth alleges in his complaint, and presented the New York Ship Construction & Trading Company to sign. These were refused on the ground they did not even remotely resemble the advertised conditions of sale and the bid accepted by the Shipping Board. So Orth threatened suit.

Suddenly, on August 19, the board passed another resolution directing that a contract—fixed up by Lasker, Schlesinger and Freund—together with a form of bond, be presented the New York Ship Construction & Trading Company to sign "without change" and to be returned to the board by 10 o'clock a. m., August 23, or the sale to the New York company would be declared off.

That contract, Orth swears, was handed the representative of the New York company late on Saturday afternoon, August 20, in Washington, D. C., and he had to get to New York, allow Sunday to intervene, go over the contract with counsel for the company, have it signed on Monday, be back in Washington by 10 o'clock Tuesday morning—August 23. Lasker was proving himself a very canny—if not a "prudent" business man.

This contract, Orth further swears, required payment on a part of sixty vessels which had been exempted by the board from the contract, and the bond was made to cover an amount which would have been payable if the whole number of ships had been included in the contract. Meanwhile, it is alleged by Orth, the board had discovered the ships were not as represented in its advertisements and was conducting a hurried inventory of the equipment while this sparring was going on.

Upon threat of a suit, Mr. Lasker by letter extended the time for delivery of the signed contract from August 23 to August 29, then to September 9, then to September 16, and finally to September 29.

Then, without warning, after learning, it is said, that the New Yorkers were going to sign the contract in spite of the "fishhooks," and have it in to the board by August 29, the board suddenly met on August 27 and passed a resolution refusing to enter into any contract with the New York company. Meanwhile the board had continued to hold the bidder's certified check for $60,270. Before the hour on the twenty-ninth the New York Ship Construction & Trading Company presented the contract as directed by the board to the board—and the board refused it.

Then the New York company sued for a mandamus in the District of Columbia courts to compel the Shipping Board to carry out its contract.

Those "useless" wooden ships which Lasker had intended to "sink if I cannot give them away or sell them," had become worth all these queer antics and weird contractual contortions on the part of Lasker, Schlesinger, Freund, Farley and the board, as well as a court action.

Schlesinger entered a general denial of every fact in the transaction, and set up the contention that Commissioner Plummer and E. P. Farley had not acted with the authority of the board in their negotiations with the New York company, that no bid had ever been made, that the ships had not been appraised, that the board had no authority to sell them under the law, that they were not the property of the Shipping Board or of the Emergency Fleet Corporation, but of the government and that the government could not thus be made to carry out the contract—and besides there wasn't any contract.

The suit lingered along, went to the Supreme Court *—and the New York Ship Construction & Trading Company suddenly found it hard to obtain credit and dropped its fight.*

Meanwhile one of the biggest financial concerns in Chicago made a verbal offer of **$11,000** *a boat for the fleet and was laughed out of the offices at the Shipping Board!*

The New York company disposed of, Mr. Lasker promptly arranged a little auction sale at the Shipping Board, and that the sale might be above question—*had the whole membership of the board present.*

When the auction sale was held—lo, nine bidders were present. It seemed as though a lot of people wanted the useless ships. Lasker sold the lot of ships—226 of them—to George D. Perry, of San Francisco, through W. M. Humphrey and J. A. McCarthy for a lump sum of $750,000, or $3,320, in round figures, a ship. The other bidders had run the price up, so Fleischhacker's men had to pay a little more.

The contempt which Mr. Lasker has repeatedly shown for Congress, Congressmen, public opinion and facts, is peculiarly exhibited in his later statement to a subcommittee of the House Appropriations committee when, after he had done the things narrated in the foregoing, he told the committee that "When we appeared before your committee in July last we stated that by October 1 we expected, and even more, that we would sell or sink the wooden ships in the James River. . . . We advertised widely for bids for the wooden ships, after offering to sell them individually or separately. It was one of the widest campaigns of advertising the government ever conducted. We ran display advertisements in the daily papers; we worked up a large measure of public interest . . . . When the bids came in we received just one bid for the entire fleet, $2,100 a ship which was subsequently raised to $2,400. We received bids for some twenty individual ships. The highest bid, I think, was for $12,500 for one ship, and there were other bids of $8,000 each for two, $7,500 each for two and $5,000 each for 17. In other words these ships, which cost some several hundred thousand dollars each to build, when widely advertised for sale in a campaign of a wide nature brought only a handful of bids for a total of from one to a dozen to twenty ships, the pick of the fleet."

After the newspapers had carried columns about Mr. Lasker's declarations that the ships were useless, worthless junk, that he intended to sink them or give them away if he could not sell them—he calmly sits before a Congressional committee and makes the statement just quoted.

Ohio Feels It's Been Swindled Politically

Politicians Plentiful in Buckeye State, But No Statesmen; And the People Feel Like "Getting" Old Parties

By HARRY E. BARNET

A LOT of talk is making the rounds in Ohio. The gist of it is that Ohioans have been politically swindled. The blame is scattered. "All of the political parties have swindled us," is the widespread complaint. And Ohioans are out to do something about the matter.

A fair idea of this talk is tied up in the statements of four representative men, who live in four widely separated sections of the state.

"Just now, the people of Ohio are ignoring political parties to a great extent," said the first man, who constantly mingles with Ohioans of every type, "because their minds are set on getting rid of the gangs of politicians who are in office, or who control officeholders.

"Both of the big political parties in the state are made up of gangs of politicians," he continued. "Ohioans are not sure how they work, but they have a pretty clear idea that they work for the benefit of no one except themselves.

An editor is the second man to be quoted.

"We know in our state that we've been breeding politicians, and no statesmen, for a long while," is the preface to his remarks. "Consequently, Ohio has no political leaders. There are plenty of bosses. But between a boss and a leader there is fine distinction.

"The state is dominated by cheap men, because Ohio politics are cheap politics. And these bosses back all sorts of people, who are grinding their axes at the expense of the mass of Ohioans. The politicians are letting them do it. A lot of these ax grinders are groups of aliens in thought, and a good many of them are aliens by birth. The politicians are allowing the alien, un-American element in Ohio to run wild, so that Americans are being shoved off the boards.

Parties Under Cloud

WORDING the sentiment of his section of Ohio, a ruralist said: "It doesn't pay to stick to party any more."

In an area where there is a large number of American-born skilled and unskilled workingmen, the fourth man said:

"Some of our people will stick to their party through thick and thin, but the majority of them don't care about political parties. Their thoughts are about an individual who can pull us all out of the whole we're in.

"If an individual of that kind comes out at the head of either the Republican or the Democratic national ticket, the majority of our people will vote for him, no matter what their party affiliations are. But they don't want a third party if it can be avoided."

Specific grounds of complaint are plentiful. The bulk of them are localized. For example, within a short period of time, and within a small area, there have been several defalcations by bank officials. Big sums of money were lost.

"Newspapers stated that in one instance of defalcation, when bank examiners were expected, the dishonest bank official entered the safe deposit boxes of individuals, without their knowledge or consent, and extracted sufficient securities to cover his shortage, and that this procedure went on for a good while," said one of the well-informed men in this zone of defalcations. "That these securities were held out to the bank examiners as being the property of the bank. When the examinations were over, the securities were returned to the safe deposit boxes. There has never been a denial of this statement, either by the government, or by anybody else.

"Of course," this man continued, "it is hardly probable that the bank official did this. Yet, there is the uncontradicted statement. And what is the effect? People say, 'Curse a government that lets such things go on. What is a bank examiner for, anyhow?'

Taxation Causes Complaint

"TAKE it in our country. We have known our bank officials all their lives. No one ever doubted their honesty. But even here of late, people have been making it a point to look into their safe deposit boxes every time they come to town. And when they make their requests to get into the bank vaults, they do it with an expression as if to say, 'Well, now, I'm going to see for myself how many of my securities you've taken out to fool the bank examiners.'

"It is true that there's nothing new in this situation. But the people know they've been stuck. They know that the Federal and state governments have done little or nothing to look out for them. Politicians, of course, represent the government. So Ohioans have their back up at last, and they're on a rampage."

Pressure of government is a general complaint; pressure of taxation, of course.

"While the Federal Government has been reducing taxation," is the general talk of manufacturers, for example, "the local governments—municipalities and the like—have been increasing it. Our proportion for state government, and especially for local government—in the municipalities, and things of that sort—have made our taxes very high."

Equaling, if not exceeding, pressure of taxation as a subject of widespread complaint in Ohio is "the *great increase in the amount of government,* a marked bureaucratic aggrandizement and a determined campaign by the blocs for still more. The inclination has been to substitute law and governmental supervision for individual responsibility and incentive."

"Experts" Are Decried

IN OTHER words, Ohioans are closer to their government than they have ever been. It is taking a hand more and more in their affairs. The editorial offices of one of the most important Ohio newspapers, as an illustration, are flooded with letters from intelligent farmers, in which they complain of close supervision by governmental "experts." Referring again to manufacturers of the state:

"We are trying to find out what the government wants us to do, and we want to comply with the laws," they say. "But if we ask the bureaus in Washington about any matters, they say, 'We can give you no advice. You proceed at your own risk.' The consequence is, we have to go along and do the best we can, and be subject to harassment later on by a bureau as to whether or not we violated any laws. We would like to know what we can do, rather than to know what is wrong after we have done something."

Similar complaints are made by other classes of Ohioans, and about various forms of supervision. "There is, in short, a rapidly developing popular feeling that we are being governed too much, and largely at the demand of groups responsible for the swing toward bureaucracy and in their interest . . . . The governmental supervision business has become a great industry, providing salaried positions for great numbers of persons, many of whom probably do not know very much about the subject in which they are represented to be expert, and do not work very hard at their jobs . . . . The tendency of a governmental bureau, once established, is always to magnify its own importance, to maintain and expand itself for its own sake and advantage."

Lobbying Is Rampant

IN OHIO, there is every conceivable organization of interests. Each organization maintains its lobbyists, and its county and state officials. Politicians cater to these organizations, and help them to pass more and more laws, and to establish more and more bureaus, each one of which "means another standing army of governmental employes . . . . another permanent burden for the taxpayers to carry."

"And the biggest part of this bureau inspection and supervision is waste," said one of the best-informed men in the state, discussing this phase of Ohio talk.

"What we need is for our politicians to get organized for the elimination of waste, instead of being organized for the purpose of adding to it."

Insincerity is said to be the basis of Ohio politics, and proof of it is abundant. Nowhere does it show plainer than in the enforcement of the dry laws of the state. To an alarming extent, enforcement has been turned over to unscrupulous political heelers, is the Ohio talk. The latter have commercialized dry law enforcement to the point where the governor has been compelled to step in, and interfere with high-handedness.

"Dry courts" have been established in many villages near the larger towns and cities, as an illustration. Officers and prosecutors in these courts, as well as the villages, are allowed a percentage of fines imposed upon violators of the dry laws. The remainder of the fine goes to the state. The result has been that everybody connected with many of these courts has plunged headlong into an orgy of money-getting, without regard for anything else. "Dry officers" from many of these unscrupulous courts range the towns and cities at will, intent only upon getting money. How they get it is entirely lost sight of.

"Probably the Volstead Act is the greatest harlot in Ohio today," said a prominent "dry" leader, who was discussing the question. "Because the enforcement of it has been outrageously prostituted through politics; and the 'wets,' of course, have done it. Not far behind them are selfish interests among the 'drys.'"

At the present time, prohibition appears to be a fixture in Ohio. There is no indication that a move to do away with it will ever get very close to a majority. Last year, as an example, the question was put up to the voters of Ohio. The result was 908,522 in favor of prohibition, and 719,505 against it.

Farmers in Ohio want better prices for their products. The blame for low prices is placed mainly upon the administration, and as a natural consequence of the World War. But farmers in Ohio are not dependent upon wheat. Farming in Ohio is diversified. One complaint is that Ohio farmers are compelled to buy in a high-price market, and to sell in a low-price one. The tariff does not satisfy them.

"But to a marked extent, farm conditions in Ohio are better than they were last year," said one of the best informed farmers. "We have prospects for an enormous corn crop. And it is the one crop that has been making money for the past two years."

This is the merest glance at circumstances one comes across in Ohio. The unrest has bred in Ohioans a wild, unreasoning spirit of "get" somebody and everybody, especially the politicians. This spirit is growing, particularly in the rural sections of the state.

The idea that no one but politicians are competent to administer governmental affairs is sinking for the third time in Ohio. The want is for something constructive. Politicians fail to meet the want.

Talk of Cox Revived

UP TO the death of Mr. Harding, Ohio was the Republican presidential zone. A shift came overnight. On the Democratic side, James M. Cox is a possibility. He has had experience as an executive, it is pointed out in Ohio. State pride produces a leaning in his favor. The League of Nations will likely be an issue in the 1924 campaign, and Mr. Cox's stand on that question is no secret.

Yet, Ohioans do not appear to be so much interested in foreign affairs as they are in getting their domestic tangle straightened out.

The high spot of all the talk about political parties and politicians that is making the rounds in Ohio is that it wanders away from the vogue. The political background of the state is orthodox. Marked political orthodoxy has characterized the state. No one can overlook it. The training of the average Ohioan, and the training of generations behind him, has been orthodoxy in politics. It is deeply instilled into him. He was born into a political party, and he stayed there. As a general statement, politicians could come close to an accurate forecast of what the vote would be, because a mass of people with this simplicity, and with this orthodoxy, does not make a business of political flourishes that are spectacular.

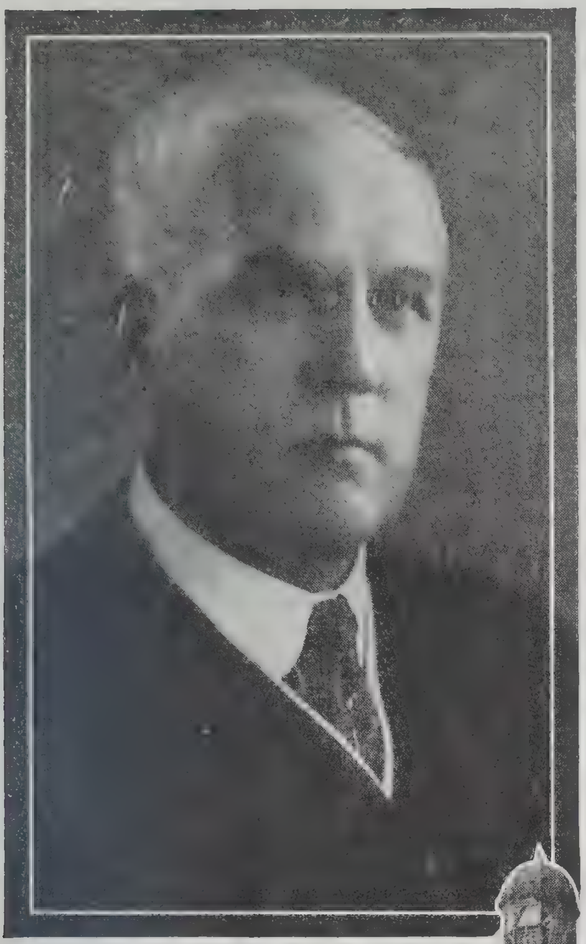
And Ohioans take their politics seriously—they make politics almost a fetish. The man who has no ideas about the game, and who cannot talk politics, is a sort of outsider, particularly in the towns, and in the rural sections, where the talk always shifts to political parties and politicians before it gets very far. But it is seldom unorthodox talk.

Hold Themselves Cheated

MOREOVER, it is pointed out in the present Ohio talk, that the combination of strong feeling, and the influence of political orthodoxy, undoubtedly played a big hand in the last gubernatorial election. Tax reform carries a tremendous appeal in Ohio. Last year, a tax reform candidate for governor headed the Democratic ticket. In one of the strongest Republican counties, he ran ahead of his ticket. In the same county, Democratic candidates for state senator and representative were defeated by Republicans. The latter are not in sympathy with a good many of the ideas of the gubernatorial candidate. Similar conditions prevailed throughout the state. The tax reform candidate was elected. The legislature is not in harmony with him. Consequently, he has not been able to make good on a lot of his campaign promises. In the Republican county cited as an illustration, as well as throughout the state, there is clamor against the governor because of his failure.

Summing up, for the most part, Ohioans appear to have been cheated politically because of their orthodoxy. It is not a far-fetched statement to say that all other political parties in the state have been stifled for the benefit of the two major ones. Politicians have taken advantage of this orthodoxy to build up immense machines, and to develop political bosses. And for years, Ohioans have been fed social, economic and political bunk. In recent years, Ohioans have been overfed with the same sort of stuff. They have been a long time digesting the bunk, but apparently they are coming to an understanding of what has been, and is, going on. Naturally, there is resentment.

Howard University Is the Negro's Harvard



DR. J. STANLEY DURKEE,
President of Howard University.

Civil War General's Contribution to Advancement of Freedmen Has Achieved Far-reaching Results

By JAMES MARTIN MILLER

DR. J. EMMET SCOTT

THE first appearance of the colored man in the English colonies was in 1619, when a cargo of Negro slaves was landed by their captors at Jamestown, Virginia. Human slavery in this country was then introduced. There was no United States of America until more than a century and a half after this event.

When Abraham Lincoln, on January 1, 1863, issued his famous emancipation proclamation, and Congress on February 1, 1865, adopted the Thirteenth Amendment to the Constitution, and the legislatures of twenty-seven states ratified it the following December, slavery was forever abolished and forbidden in the United States and its territories.

Four million slaves were released from the bondage that had held them for 246 years as mere chattel, selling at from $50 to $300 a head. We hardly realize that the colored man, in this country, has been free for only fifty-eight years. Even to this day we have many old "darkies" who served as slaves, but they are becoming as scarce as the thinning ranks of the G. A. R. Soon, their old plaintive melodies and plantation songs will be no more.

Fifty-eight years ago four million colored people were freed from their masters and turned loose. They were without money, homes and education. They could neither read nor write, except in the rarest instances. But they were not without powerful and sincere friends, and the loyal and intelligent colored man is deeply appreciative of this fact, and always will be. Today we have approximately 12,000,000 colored Americans in the United States who are proud of this great country—*their country*. One American in every nine, of all our complex population, is colored. There are three times as many colored people in this country as in the year they became freedmen. The fair and unbiased student cannot but conclude that the colored people of this country have made amazing progress and that they are among our most patriotic citizens and are serving our country faithfully. Religion and education have been, and are, the salvation of the colored race, as of all races.

On March 3, 1865, the Freedmen's Bureau was created and the education of the freedmen became one of its special objects. In 1870, however, the bureau was discontinued, as its mission in starting schools was fulfilled. In the five years 4,239 schools were established with 9,307 teachers and 247,333 pupils. Three and one-half millions of dollars was expended for education in that period and one million five hundred thousand dollars for benevolence. In addition, the freedmen themselves raised and expended $785,700 for their education. Thus they were taught self-reliance about which they had never had any opportunity of knowing anything before. The first effort, however, to provide a school for the colored people was on September 17, 1861, by the American Missionary Association at Fortress Monroe, Virginia. This school laid the foundation for the Hampton Institute, a splendid school in a flourishing condition at this time, providing a secondary education. This was the beginning of the general education of the colored people in the South. There are now several schools, such as Hampton Institute and Tuskegee, the latter made famous by the late Booker T. Washington.

But it is the purpose of this article to describe the greatest university in the world devoted to the higher education of the colored people. This is Howard University, the Negro's Harvard, located at Washington, D. C. It is open to both men and women. The creation of this great university was the crowning effort of the late Major-General Oliver O. Howard, of Civil War fame. Ever since the writer had the honor of meeting and knowing, as a friend, the gallant one-armed General Howard, after he had retired, in California, his interest in Howard University became a special one.

In 1865 General W. T. Sherman wrote Major-General Howard assuring him of sympathy with his projects for the spiritual and intellectual redemption of the four million colored people of America, and expressing confidence in his sincerity and ability. "But," said Sherman, "you have a Herculean task." In the light of this sincere but very discouraging letter, it is interesting to reflect that within less than two years from the date on which he received it, General Howard was instrumental in establishing a university which now has been in existence for fifty-six years. It is a monument to the faith, the wisdom, and the courage of its distinguished founder.

The main building

The School of Medicine.

General Howard was a religious man, and was active in church and religious work practically until the day of his death. Howard University was conceived at a prayer meeting, at which General Howard was present, in the First Congregational Church of Washington, D. C., on Monday, November 20, 1866. Originally Howard University was planned for the education of colored youth in the ministry only, but it came gradually to embrace all branches of knowledge for all races of men. General Howard opposed naming the university after himself. He felt that he could serve the institution better if it bore some name other than his own. His opposition, however, was brushed aside and those who acted as trustees gave it the name of Howard University. The act of incorporation reads in part:

"1. Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, that there be established and is hereby established in the District of Columbia a University for the education of youth in the Liberal Arts and Sciences, under the name, style, and title of 'The Howard University.'

"5. Be it further enacted, That the University shall consist of the following departments, and such others as the Board of Trustees may establish—first, normal; second, collegiate; third, theological; fourth, law; fifth, medicine; sixth, agricultural."

The first ten years of the life of the University were years of feverish growth. Without one cent in the treasury, the normal and preparatory departments opened on May 2, 1867, in a rented frame building with five students. The trustees soon arranged for the purchase of 150 acres of land at $1,000 an acre. By the year 1873 the trustees had received from the Freedmen's Bureau $500,000. This substantial sum with the income from the sale of the greater part of the 150 acres of land, at four times the price paid for it, cleared the University of debt and started an endowment fund. These lucky turns were made just in time to escape the sudden financial panic of 1873. The Freedmen's Bureau was abolished and church support withdrawn from the University. By 1875 the University was $100,000 in debt and was facing bankruptcy. Salaries were cut one-half and four departments, including the medical school, were closed. This drastic action saved the University, and by 1877 the income covered expenses. Emerging from this crisis, much reduced, but still intact, the University entered upon a period of slow but healthy growth.

The Andrew Rankin Memorial Chapel.

As times became better individual donations began to come to the struggling University. In 1881 a single gift of $25,000 was received and in 1885 another for $15,000 came. About this time the United States Government began to make an annual appropriation. This was small each year until 1906. Between 1906 and 1912 Congress appropriated $675,700 for Howard University. Each year since the government has appropriated approximately forty per cent of the expenses of the University.

This year Congress appropriated $100,000 for current expenses and $175,000 for a new gymnasium. In addition to the annual appropriations, Congress has made appropriations to help erect buildings as needed. About sixty per cent of the University's resources come from private contributions and from receipts from tuition. The rate of tuition is very low. Andrew Carnegie made the University a gift of $50,000 for a library building several years ago.

The faculty of the University consists of about forty per cent white and sixty per cent colored. There are only six women teachers. Dr. J. Stanley Durkee, of Brockton, Massachusetts, became president on July 1, 1918, and has given the University a successful administration. There is a faculty of 173. Dr. E. E. Just (colored) is one of the most noted professors of zoology in this country. Dr. J. Emmett Scott (colored) is noted as an educator and author. He is secretary-treasurer of the University. The institution offers students standard university courses in architecture; liberal arts; commerce and finance; civil, electrical and mechanical engineering; education; languages; library-science; law; medicine; journalism; dentistry; pharmacy; music; public health; nursing; physical training; hygiene; sciences; theology. The graduate school confers the Master of Arts and Master of Science degrees. In 1919 the preparatory course was discontinued. Only collegiate work is offered.

The requirements for entrance to the medical, dental and law schools are the same as standard universities and rank as class A schools. The school of religion does not and cannot receive financial aid from the government. This department is dependent entirely upon voluntary gifts for support. It is inter-denominational. The school of religion is open without discrimination to students of all denominations.

On the square adjacent to the medical college is

(*Concluded on page 14*)

Swiss Colony Center of U. S. Cheese Industry

Concluded from page 2

had no implements for the rapid harvesting of their crops. Once the crop was gathered there was no nearby market and it had to be hauled by horses or oxen over one hundred fifty miles to the Milwaukee lake port. Prices were low and even in the best of years the members did not realize more than thirty-five cents a bushel for their harvest.

With the still further tumble of prices after the Civil War, the colonists turned to dairying. The change was imperative. Their exhausted soil would no longer raise a full crop; the ravages of the chinch bugs swept away many of their acres and the development of new lands as wheat fields across the Mississippi River threatened the ruin of their vanishing market.

"Drovers from Ohio had brought cows to Exeter, then known as a mining town," writes Emery A. Odell, the editor of an enterprising daily paper at Monroe, in explaining the transition. "The Swiss excelled in the care of the cow and now the Switzer turned to his benefactor in the old country. Cows were purchased in sufficient numbers to give each family one. The cost was twelve dollars each and was paid out of an unexpended balance of one thousand dollars aid that had been sent to them from Switzerland. It was the inauguration of the dairy industry, which was to be the foundation of the dairy industry of Green County.

"Fields were seeded to clover; cows obtained; cheese factories built and in five or six years cheese making became almost the sole occupation of the farming population. Farms became more productive year by year, buildings better and larger, the homes more comfortable and modern, while bank accounts grew with the natural increase in the value of the land, and made all the earlier dairymen wealthy.

"Cheese no larger than a saucer, made in the homes, was increased in size until the 200-pound Swiss cheese is today the standard. Cheese was first made for home consumption; later it was found it could be sold for profit in Monroe, the county seat, and in Milwaukee. Afterward a ready market was found in the large cities of the East, and in time, and for years past, the cheese moved in carload lots to every state in the Union."

Green County has played no small part in making Wisconsin the leading dairy state in the Union. Wisconsin ranks first in the total production of cheese of all kinds. Approximately two-thirds of all the cheese produced in the United States is made in Wisconsin. Wisconsin ranks first in the production of Swiss, brick and Muenster cheese, and second in the production of Limburger cheese.

Wisconsin ranks second as a butter-producing state, producing eleven per cent of all the creamery butter made in the United States.

Wisconsin ranks first in condensery products, producing upward of one-fourth of the total production in the United States.

Wisconsin ranks eighth in the production of ice cream.

For the year ending June 30, 1922, Wisconsin had 2,807 licensed cheese factories, 667 licensed butter factories, 72 licensed condenseries, 675 licensed receiving stations and approximately 185,000 dairy farms.

The total value of dairy products of Wisconsin for the year ending June 30, 1922, based chiefly on reports to the dairy and food commissioner by manufacturers and producers and partially on conservative estimates, was $200,828,249.92.

And in this dairy achievement record of Wisconsin, Green County stands out pre-eminent. This single county produces two-thirds of all of the Swiss cheese made in the United States. It has become the heart of the foreign cheese industry of the nation. While two-thirds of the foreign cheese made in the county is Swiss, almost two-thirds of the remainder is brick and the rest Limburger. A recent report showed there was but one American cheese factory in the county.

Little wonder that this pre-eminence in dairying should lead Wisconsin to establish the first dairy school in America, at Madison, the seat of the state university. Nor is it strange that a course should be established to teach the art of foreign cheese making.

Many curious stories are told about the development of this foreign cheese industry. When the Swiss farmers first began to haul their Limburger cheese to Monroe for shipment to other markets, the first "Yankee" residents of the county seat objected to the odor of their wagon loads. Once it was proposed that an ordinance be adopted that would exclude the fragrant shipments from the main public thoroughfares. But with the large financial returns, a saner judgment prevailed and today Monroe is one of the principal cheese shipping points.

Moreover, there has been a deep sense of gratitude among these Swiss farmers. Every dollar that was loaned by the cantonal government of Glarus, in Switzerland, for the founding and development of the colony has been repaid with interest. Sixteen years after their coming a fire swept the city of Glarus in Switzerland, and the 425 residents of New Glarus sent $5,000 in aid. In 1880, when the Swiss town of Elm was overwhelmed by the falling of a mountain, the New Glarus farmers sent a contribution of $20 000. This is the loyalty that has prevailed; this is the spirit of gratefulness and charity that has manifested itself among these peoples.

With the development of the cheese industry came the improvement of the farms. Herds of high-grade Holstein and Brown Swiss cattle took the place of "scrubs." With the erection of the big barns came the silos, until today there are nearly 2,000 silos in the county, a larger number than can be found in any other county of the state. It also leads the other counties in the growing of alfalfa, and on the basis of population, in the number of automobiles owned.

Nor is Green County large in area compared with some of the others in Wisconsin. It is only twenty-four miles square. It has a population of 21.568, according to the last census. The cattle outnumber the population three to one. There are approximately forty head of cattle to every farm. All but five per cent of the farmers are actively engaged in dairying. Farm statistics of the county show an acreage of 363,025, with 1,730 farms, of which 1,589 are owned and 141 rented. The dairying industry seems to have dealt a deathblow to the farm tenancy problem.

The assessed value of all property in the county is $63.688,004, of which $53,929,882 is in real estate and $9,758,122 in personal property. There are 143 cheese factories operating in the county and four large condenseries. The estimated financial return to the farmers of the county from the sale of milk and cheese is approximately $8,000,000 annually. The per capita wealth is estimated as $3 200.

"Every night and morning the cattle of the county yield enough milk to float a ship," declared Mr. Odell, "and each factory is the scene of great activity in the early hours of the day and following the evening milking until late at night."

Green County can produce as high a quality of Swiss cheese as is made anywhere in the world. That is the statement of Fred Marty, widely known cheese expert and for sixteen years a member of the state dairy and food commission.

"We have good blue grass, limestone sub-soil, spring water and ideal climatic conditions," declared Marty.

"It's all a question of care and workmanship, and in these also we are not lacking.

"We produce about 13,000,000 pounds of cheese a year.

"For Swiss cheese making, the milk must be fresh and must not contain too much acidity. For this reason the farmers are compelled to make two deliveries to the factory daily, because most of them have not the facilities for caring for the milk. The milk must be in a certain condition to produce the eyes and holes in the cheese.

"Swiss cheese making offers great opportunity for the farmers. If some of them would exercise a little more care, they could easily get five to ten cents a pound more for their product.

"Swiss cheese enjoys a big demand, but I do not believe the American product will ever drive the foreign commodity from the market. We do not produce enough to meet the demand and the foreign product has a well-established demand. This is not because of better quality, however."

Nor has the sturdy, prosperous Swiss farmer forgotten the hard trials of the first generation of immigrants nearly all of whom have passed away. In the public square, on the edge of an old churchyard in New Glarus where the early colonists were buried, a large granite monument has been erected extolling the virtues of the first pioneers.

Howard University Is the Negro's Harvard

Concluded from page 13

the Freedmen's Hospital, the greatest colored hospital in the world. Erected at a time of economical construction, the hospital cost $600,000. Clinics are held every day of the year except Sunday. The medical students have the advantage of this hospital for their work in clinics. There are thirty-eight women studying medicine, dentistry and pharmacy. Eighteen women are studying law in this year's classes. There are, all told, 1,954 students in the University. These students come from thirty-eight states and ten foreign countries.

There are several fraternity and sorority houses in which students live. There is a splendid women's dormitory and a modern dormitory for men where room and board is furnished at a very moderate rate. There are twenty-five buildings set in a beautiful campus of twenty acres, adjacent to the National Soldier's home and overlooking beautiful Washington and the Potomac River. The total value of the endowment, plant and equipment of Howard University is $2,134.940.98.

Howard University is the capstan of Negro education. Here are trained more than two-thirds of all the class A colored college students of the United States. Howard University is molding world leaders of the race, for she is drawing students from the West Indies and other foreign countries. Howard's graduates are everywhere leaders in the professional, civic, and social life of the colored people. The wife of the president of Liberia is a Howard graduate. This great university for colored people has proved that the Negro is capable of receiving a higher education. The graduates of Howard University are sought by other colored colleges and schools throughout the country as professors and teachers.

The following summary of the progress of the Negro in this country is significant.

In 1863 there were only two newspapers published by Negroes, and these were in the North. The first Negro newspaper to appear in the South was in October, 1865. At the present time there are 400 secular and religious newspapers and magazines published by colored people for colored readers in the United States.

Negro fraternal insurance organizations carry an enormous amount of insurance on the lives of colored men and women and have $20,000,000 of assets. There are eighty banks in the United States, owned and conducted by Negroes, having $20,000,000 of resources.

In 1922, the colored people of the United States owned 650,000 homes, operated 1,000,000 farms, conducted 60,000 businesses and had accumulated $1,500,000,000 of wealth, or about $125 per capita.

The last census report shows that there are 45,000 churches of colored people in the United States; value of church property $90,000,000; property of colleges and schools devoted to higher, secondary and primary education, $30,000 000, amount expended for education last year, $28,000,000.

Fifty-six years ago, when Howard University started, the 4,000,000 Negroes given their independence were illiterate and starving. The government had to feed and shelter them or they would have perished. Congress established the "Bureau of the Refugees" to care for them. Up to 1869 the government spent $20,000,000 furnishing them food and clothing. As Howard University, the premier university in the world for colored people, has progressed from its humble beginning, so have the colored people advanced most amazingly in a spiritual, a cultural and a material way.

How Your Red Cross Dollars Are Split

Concluded from page 3

if the controller's figures were to be taken at their face value.

Here there needs to be stated some facts by way of explanation, perhaps in extenuation, of this method.

Red Cross was engaged in an entirely new job. There was no precedent to go by. Never had such a vast charity fund been collected, nor such a vast area of charitable efforts essayed. From doing everything possible for the welfare of the American soldier, Red Cross began to try to do everything for the welfare of mankind wherever he dwelt, the latter after the soldiers returned from France and the necessity of distribution of the enormous relief stocks in Europe arose.

A project was "sold" to Red Cross. The cost had to be guessed at. An "appropriation" had to be made. Clearly, the funds set aside for the project must be in an amount large enough fully to cover the cost of carrying it out. The project carried out, the money left over "reverted" to the organization so there was always a large contingent asset to be thought of under the head of "reversions."

An interesting case in point was this one: At or about the time of the closing of the war, the parties in power in Russia conceived the idea that the scarcity of food in the cities of Petrograd and Moscow could be partially met by the sending of the city children to the country where there was enough food at least. Several hundred were sent to the Ural Mountains, on the Siberian slopes. With the changing of control in Russia these children were practically forgotten.

At a later time a Russian patriot, of the czarist brand, named Kolschak, gathered together an armed force to capture his country from its then control. As the latter were those who brought about, or allowed to be brought about, the retirement of Russia from the Allied group, so far as fighting Germany was concerned, the Allies lent Kolschak their moral and, to some extent, material support. (The same thing was done later as to Denekine in the Odessa neighborhood and as to Wrangel in the Crimea. Kolschak, Denekine and Wrangel are now styled "adventurers," possibly because they failed.)

In all these ill-starred ventures looking to the invasion of Russia with Allied support, the American Red Cross followed along and set up its commissariat of relief. Hence Red Cross found itself in Siberia. Red Cross ran across the forgotten children in the Urals and took charge of them. They kept watch and guard over them for nearly two years, and in course of time transported them across Siberia, to our own Pacific Coast, across America, across the Atlantic, into the Baltic, and through the instrumentality of the unit at Riga delivered all the children to their relatives in Russia. This was probably the most dramatic and most thoroughgoing project Red Cross ever undertook and there are those in Washington now who will never forget the thrill they had when the Red Cross man in Riga cabled announcing the safe delivery of the little (at least they were little when Red Cross took them over—many had almost grown up and all had wonderfully improved in mind and body when they reached home) children and the accounting department looked forward with intense interest to the bill of particulars in money.

It developed that of several hundred thousand dollars "appropriated" for this extraordinary undertaking nearly half was available for "reversion." One hears often of "concealed assets" in corporations but it is to be doubted whether a cash asset was ever so completely concealed as the remainder of this particular appropriation. And it so happens that this cash was a part of the money the treasurer found among his balances of which the controller took no cognizance in his statement of affairs to Red Cross constituents in America.

Included in the amount spent in behalf of these little Russians were salaries of nurses and teachers, hire of whole trains and steamers, dock charges, and what not. The whole amount was charged to "relief" and very properly so. But not every project carried out was as simple as to the accounting as was this one, but anyone with a rudimentary experience in bookkeeping will see that in the gross sums reported as spent by Red Cross, large amounts are counted twice. Confusion in the figures, at least it appeared like confusion and inconsistency to the lay mind, was inevitable.

Laureate of the Sunny South Has Never Written Bitter Word

Frank Stanton, Whose "Mighty Lak a Rose" Alone Would Bring Fame Is Close to Heart of Dixieland

By AARON HARDY ULM

SEVERAL years ago, the Atlanta, Georgia, Chamber of Commerce decided to turn, for an evening, from the tedium of business to the flights of fancy.

Its officers and directors planned a big public dinner in honor of the city's leading literary man, a poet. But the event proved to be a Hamlet minus the melancholy Dane. The poet failed to appear.

Undaunted, the business body planned another dinner in honor of the poet, who, as he had done on the first occasion, promised by the wings of Pegasus that he would be there.

But the canny business men paid no attention to the poet's promise. Instead, they appealed to the police. For four or five days preceding the banquet the prospective guest of honor was shadowed by local officers of the law, who worked in concert. Whenever during that time the poet in his goings and comings would turn aside from his accustomed pathways, a policeman would overtake him, tap him gently on the shoulder and politely say:

"No, no, Mr. Stanton, that isn't the way you want to go. This is the way and, if you will permit, I'll go along with you." And the officer would see him to a street car or the office where he worked or to his home.

And by these means the presence of Frank L. Stanton at a big dinner given by his local fellow citizens in his honor, was brought about.

For the man who for nearly a half-century has exploited, by verse and anecdote, the sunniness of Dixieland, has all the shyness that goes with true genius.

Frank Stanton, still giving daily expression to the bright and quaint phases of life in Dixie, belongs largely to the Old South. He is almost the last writing man who breaches the post-Civil War gap between it and the New South. As a poet Stanton belongs largely to even older eras, to the medieval Paris of François Villon, the London of the Elizabethans, and the Eighteenth Century of Bobby Burns. As a man and in many ways as a writer he reminds one most of Burns, whose poetry probably has had greatest influence on his own work.

His own life story is in many respects Burnsian. He comes not from the Bourbon class which has supplied nearly all the distinctive Southern writers. Born in Charleston, South Carolina, at about the time of the Civil War, getting in school only the rudiments of an education, he began active life as a printer. Later he became editor of a weekly newspaper published in a remote village in the then frontier region known broadly as South Georgia.

Instead of hunting up small items of news and printing them in the manner of the ordinary weekly newspaper, Stanton filled the columns of his publication in the main with humorous verses and sketches in dialect reflecting the peculiar atmosphere of the South.

His paper was probably the most clipped weekly published in America. His bits at one time were republished more frequently in English-speaking foreign lands than were those of any other American writer.

His work attracted the notice of Henry W. Grady, the great Southern editor, and of Joel Chandler Harris, immortalized by the "Uncle Remus" stories.

Stanton joined the staff of Grady's paper, the Atlanta *Constitution,* on which Harris also spent most of his life. There for more than thirty years, Stanton has conducted a daily column of verse, proverb and anecdote. He now is the last of the first school of newspaper "colyumists." Meantime, he has published five volumes of verse.

Of the nature and quality of the run of his verse nothing can give a better view than what was written by Joel Chandler Harris in an introduction for one of Stanton's volumes:

"Here is one with the dew of morning in his hair, who looks on life and the promise thereof and finds the prospect joyous. Whereupon he lifts up his voice and speaks to the heart; and, lo! here is Love, with nimble feet and sparkling eyes; and here is Hope, fresh risen from his sleep; and here is Life, made beautiful again."

For introspective writing, Stanton has as little tolerance as did Bobby Burns. Load him down with pains and sorrows and still he could write only optimistically, though never in the vein of optimism for its own sake so notable in newspaper syndicated verse and sketch of the present day.

Nearly all the anecdotes which have developed around Stanton's life have to do with the cheery note which invariably is sounded in whatever he pens.

Once following several days of absence without leave from his desk he, with a weary and depressed countenance, walked into the office of Clark Howell, editor of the paper.

"I must have ten dollars," he said.

"Here's a dollar," said Howell. "When you bring me copy for tomorrow's paper, I'll give you the other nine."

"All right, you'll have it in an hour or two," Stanton replied.

An hour or so later the editor found the poet bending over his desk asleep.

In one hand was the dollar and in the other a sheet of copy paper on which had been written the following:

"When a man has spent his last red cent,
He feels mighty blue, you bet;
But give him a dollar and you'll hear him holler,
'There's life in the ol' land yet.'"

Stanton has expressed his conception of his art in a poem of which the following is the first verse:

"Chorus of singers!
The world hath need
Of the humble strains that fall
On the wayside love,
On the paths that lead
To the light that shines for all."

For the bizarre and the analytical and the abstract he has little talent. But his wistfully rustic touch often has given wretchedness a countenance seen clearer and further than if the sketching had been more formalistic.

Several years ago a western governor stated that he had been led by a poem having naught to do with the particular case to reduce the sentence of death imposed on a man to one of life imprisonment.

The verse was not that of Masefield's "Widow of the By Street," but Stanton's "They've Hung Bill Jones," the first verse of which reads as follows:

"They've hung Bill Jones
To the sycamore tree,
An' his wife an' his mother
Is a-weepin';
An' his children's come
From the house to see,
An' the col' wind's a-wailin'
An' a-creepin'."

But the brighter sides of life are dealt with chiefly in the Southerner's verse. Where will you find an apter statement of life's intrinsic beauty than in the following?

"This world we're livin' in
Is mighty hard to beat;
You get a thorn with every rose,
But ain't the roses sweet?"

Of course you have heard Nevin's musical interpretation of "Mighty Lak a Rose." The verses are even prettier. They were written immediately after their author, Frank Stanton, had looked for the first time on the face of his eldest child.

"Sweetes' li'l feller,
Everybody knows;
Dunno what to call 'im
But he's mighty lak a rose.

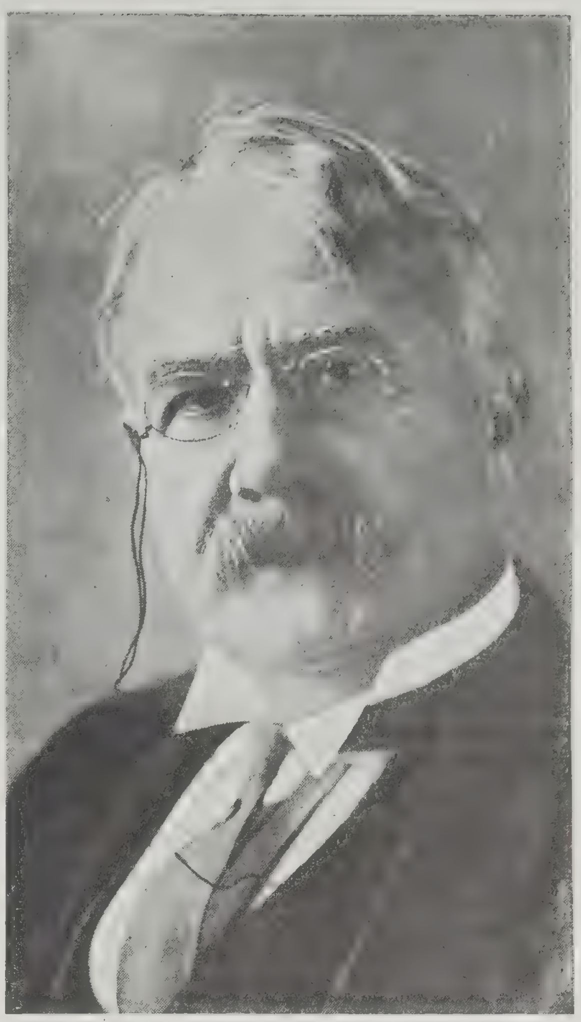
"Lookin' at his mammy,
With eyes so shiny-blue,
Mek' you think dat heaven,
Is comin' close ter you.

"W'en he's dar a-sleepin'
In his li'l place,
Think I see de Angels,
Lookin' th'oo the lace.

"W'en de dark is fallin'
W'en de shadders creep,
Den dey comes on tip-toe
Ter kiss 'im in his sleep."

In his story poems of old Southern life, of a life that now seems remote, Stanton is at his best. He knows the Negro in his lighter moods almost as well as did his old associate of the "Uncle Remus" stories. And in Stanton's hands the "cracker" type of Southerner takes on a quaint picturesqueness of superbly entrancing quality.

But it is the light and laughter ever suggested if not always propelled by Dixie's brilliant sun, as expressed in the Glory Halleluias of the old-time camp meeting as well as in the shake-down dances of the countryside, which Stanton has devoted his life to glorifying.



FRANK L. STANTON

In "The Oft-Told Tale" he has written:

"Thousands of years the tale is told,
And even as a day,
With all their needs, and dreams and deeds,
The centuries roll away.

But the world is ever young,
And life the future craves,
And the roses hide where the dead abide,
And the world forgets its graves."

And, too often, its living singers as well!

Several years ago, Stanton was called from his desk to answer an early morning telephone call.

"Congratulations, Mr. Stanton!" came a woman's voice over the wire, the only voice that had spoken awareness of his birthday.

"Won't you tell me which one it is?" the caller asked pleasantly.

"Certainly," said the poet. "Today, I am fifty."

A little later a messenger placed upon the poet's desk an envelope. When it was opened five ten-dollar gold pieces rolled into the poet's hand. They were accompanied by a note from a woman of the Old South. It asked that he accept the gift as an expression of appreciation from an admirer.

"What a sorry business man I am!" exclaimed Stanton, for it was his sixtieth birthday and the fib about his age had cost him exactly ten dollars.

Stanton belongs to that passing tribe of capable writing men who lack facility for turning their talents into big financial success.

James Whitcomb Riley, who was among his closest friends and admirers, once persuaded Stanton to join him on the lecture platform. The two traveled together for a while but the task palled on the Georgian, who returned to his less remunerative ways, to which he has held steadily ever since.

He and Eugene Field, too, were close friends, and one of the prettiest tributes to that other early "colyumnist" came from the Georgian's pen:

"Fades his calm face beyond mortal ken,
Lost in the light of lovelier realms above;
He left sweet memories in the hearts of men
And climbed to God on children's love."

A year or two ago a famous critic, in passing slurringly on a volume of verse, compared the offering invidiously with the work of Frank L. Stanton.

Stanton saw the dig and though it hurt he did not resent it.

"I was reminded, however," he said when speaking of it, "that the same critic less than a dozen years ago referred to me as one of the sweetest singers living. I didn't deserve the tribute then; but I am afraid that the critic and many others merely have forgotten."

And though to a great extent the world has passed him by, Frank Stanton goes on, turning out his daily "takes" of verse and sketch redolent of a Dixiean atmosphere too often obscured by the modern newness of external things in that sunny land.

A search of all Frank Stanton's voluminous writings, the greater proportion of which are embalmed in newspaper files, would not reveal one bitter word, nor one that does not seek to reflect the beauty of life and being.

Many of his poems, especially several that have been set to music, like "Mighty Lak a Rose" and "Just a-Wearyin' for You," have already taken enduring place in the folk literature of this country.

Those who would know the Old South will find his verses as necessary and as helpful as the prose writings of Harris, Cable or Page.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Thomas Hardy, the English novelist, called by Kipling "Lord of the Wessex coast and of the lands thereby," lives near Dorchester. Recently he received a visit from the Prince of Wales and as a result of the royal visit, photographs of the novelist and the prince abound in the illustrated English press. Mr. Hardy's workshop is a top room of Max Gate, his home, from the windows of which are noble views of woods, downs, and meadows, with the waters of the Frome meandering among them. When engaged on his novels, Mr. Hardy betakes himself to this room immediately after breakfast each day, and writes steadily until the whole day's work is done. If anything interferes with that schedule he finds it impossible to settle down to work again until after sunset.

Airplanes will be used for business and pleasure in the United States within the next ten years on a scale commensurate with the extension of automobile traffic between 1905 and 1915, it is predicted in a statement issued by the Department of Commerce.

A maker of stringed instruments in Italy has discovered the secret of the renowned varnish of Cremona violins which used to give to the old instruments their marvelous sonority. He found the secret in an Italian manuscript dated 1716 and states that it is made with certain resinous substances and is not soluble in alcohol. The varnish was invented by the brothers Van Eyck and used by their Flemish successors. From Holland the secret of its making was brought to Italy by Antonello da Messina, and it became known to the Cremonese through some painter in the sixteenth century.

An international system for the location and identification of criminals and fugitives is being planned by the United States, in co-operation with the principal European nations. Exchange of information regarding crimes and criminals, including fingerprints, measurements and other identification data between the nations entering the agreement is contemplated. Great Britain, Belgium, France, Holland and Italy approve of the plan.

Big aircraft firms of England plan on producing an airplane for less than 100 pounds sterling. The cost of maintenance and operation will be slight.

When the Eastern Telegraph Company laid the Cape cable in 1899, the route between St. Helena and Cape Town was surveyed, soundings being taken every fifty miles. When the cable parted recently the repair ship found that at one point the ocean bed had risen to within three-quarters of a mile of the surface, where the chart had shown a depth of just over three miles. The bed of the Southern Atlantic consists of ranges of mountains, of which Ascension and St. Helena are the lone sentinels.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The government has fined a number of transatlantic companies amounts aggregating $563,500, because it is alleged steamers bound for New York City crossed the barrier a few seconds before midnight, August 31. The lines were not only fined two hundred dollars for each alien brought into the United States in excess of the twenty-per-cent quota, but will be forced to pay in passage money, although the aliens have been ordered admitted in the September quota, and will not require return passage.

"Savages on the South Sea Islands get more satisfaction and happiness out of life than we do with our incessant pursuit of the dollar," said Dean Charles R. Brown, of Yale Divinity School.

A protest against the singing of Christmas carols in the public schools of Spokane was made at a recent meeting of the school board in a letter from Rabbi Julius Levin, of the Temple Emanu-El, and Sam Edelstein, attorney, an official of the synagogue. It was pointed out that Christianity was looked upon by Judaism as sectarian, just as Mohammedism, Buddhism and other forms of belief. Objection was made to the carols on the ground that Jesus of Nazareth was referred to as God and Savior, in violation of the teachings of Judaism. No action was taken by the board at that time, as the percentage of Jewish children in the schools is small.

When a private stationed at Fort Benning was engaged in cleaning a rifle which he had just drawn, he pushed out a small roll of paper which contained the following message: "This rifle was used by Pvt. Franklin Webster, 2010213, I Co., 125th Inf. I fired this point-blank at seven Germans, Oct. 7, 1918, in an attack on the Kriemhilde Stellung during the Meuse-Argonne offensive. On Oct. 11, 1918, I fired with this rifle 115 rounds while in the third battalion, 125th Inf. Gassed in the Death Valley near Geanes, France. Whoever draws this rifle can know it has done its bit."

A new gold currency in the form of a "rye Bond" may be issued by Germany. This would be stabilized on the basis of the Bourse quotations for rye.

The pollution of our inland and seacoast waters is steadily increasing. Hundreds of dead bluefish and other species have been found floating in large fields of oil and tar pollution between New York and New Jersey. An embargo has been issued on soft-shell clams coming from the Sandy Hook section because of dangerous impurities that might be taken into the human system from these polluted clams. The Great Lakes are being polluted. Shores on the west coast of Florida are poisoned from discharges from phosphate mines. This stealthy poison is no respecter of persons, class or rank. Polluted seafood may reach the dining table of the bank president as well as the dinner-pail of the ditch digger.

A fireless railway locomotive is being developed in France. It is equipped with a boiler after the manner of the ordinary locomotive, but the water in it is heated to the necessary temperature from a stationary plant. Enough power can be stored in it to operate it four hours for switching purposes in a railway yard. It requires but fifteen minutes to charge it.

Hotels and refuge huts in the mountains of Alpine Switzerland are to be fitted with wireless telephones.

Miss Grace Li, daughter of Li Yuan-Hung, president of China, is attending Wellesley College. In contravention of the custom of protecting the daughters of the rulers of China with troops of attendants Miss Li arrived with only one companion, a girl of twenty-one. The girls have rented a hall bedroom in a side street.

The German mark dropped so rapidly recently that many Berlin restaurants changed prices on menus in the midst of meals, managers and assistant managers rushing from table to table altering the tariffs before the guests asked for their bills. Many stores closed until they could get the final official rate of the day. The government granted cities, industries and stores the right to print their own money. No record is kept of the output and the country is becoming flooded with currency.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

CHRONICLER OF THE NEGLECTED TRUTH

When J. M. Barrie Spoke to the "Red Gowns"

The Great Novelist's Triumph at St. Andrews—His First and Last Public Address

By One Who Heard It

"COME down, Christmas-time. We'll show you roses in December." A phrase caught in passing . . . . "roses in December" . . . . and in an instant I am back in the spacious hall of an ancient seat of learning in a grand old town by windy dunes which take the spray of cold, northern seas. A gentle, tired-looking man with fine forehead, shedding from serene eyes upon a great audience of the chosen of his country "the sunbeams of a cheerful spirit," is playing upon human hearts to their great uplifting. Words seemingly simple are sending mighty surges of tense feeling over the packed masses of students and the whole distinguished assemblage of alumni. It is Sir J. M. Barrie, Lord Rector of the University of St. Andrews, on his first and last public appearance, uttering that splendid Call to Youth which thrilled around the world.

Upon those of us who were the eyes and ears of the world on that occasion when the creator of the immortal "Peter Pan" gave of the light that is in him in an endeavor to reveal a path to Youth of all lands, there fell no slight responsibility. I often doubt if we did justice to our great privilege; but if we failed, be it urged in our behalf that we, too, were dazed by the light when the man who plays hide and seek with the angels, who has caught from them somehow the glowing joyousness of childhood and set it apart for all such as are children and would be happy, and all such as were reft of real childhood, turned upon our common path a blaze of brilliance. So, at least, it seems to me, as once again there comes to mind the unforgettable scene and that memorable opening sentence: "You remember some one said that God gave us memory so that we might have roses in December."

Quiets Turbulent Spirits

THE tender sentence, spoken quietly and with an air of sweet assurance that all were familiar with the thought, had the effect of an electric shock. Barrie had faced his audience but for a moment. It was a lively audience. The student has his "days out" in Scotland as elsewhere. These are the days when there is no respect of persons; when the rafters ring and even reverberate; when the paper bag of soot reposeth conveniently in the coat pocket, with its kindred bags of peasemeal and flour; when the bugles and police whistles and motor horns fulfill unwonted functions, and the pillowcase of feathers lieth in wait upon the balcony edge, and the barnyard fowl is "present in custody" for such purposes as shall seem good to its guardians; when the popular professor is made to blush, but not so redly as the unpopular one.

This was such a day. The turbulent spirits were prepared for everybody whom they knew. They had soldier-slang to hurl at Field-Marshal Earl Haig, a roar of welcome for Miss Ellen Terry, and no lack of matter to remind Barrie of things he had written. Had they known Colonel Freyburg, V. C., he would have been honored suitably. (This was the man who considered it "a great lark" to drop, naked and painted black, overboard from a ship off Gallipote on a frosty, pitch-dark night, for a two-mile swim, pushing to shore ahead of him a raft packed with decoy lights to deceive the Turks as to the point at which a landing was to be attempted. He got his raft ashore, placed his decoys, paid a private visit to the Turkish lines, lighted the decoys and returned, the while a bombardment from the ships and the reply it drew made the adventure no less hazardous. Incidentally, neither we nor the students had heard of that act until the Lord Rector told of it that day.)

This audience, ripe for mischief and fully prepared to make the most of its opportunities, Barrie captured with a phrase . . . . "Roses in December" . . . . the acute young minds leaped at the thought . . . . fragrant memories to sweeten the winter days of life . . . . and in the hush that ensued one realized that the quiet voice was speaking on, casting a net of kindness and understanding over those young people and drawing them toward the speaker in delighted fellowship; for the voice was picturing to them the Barrie who was one of themselves, the Barrie who climbed the statue to tie the colors of his Rectorial candidate round its neck and was "hurled therefrom with contumely." the Barrie who loved them and would help them, if he could, over the rough places of the road before them. The elders of the audience saw the spirit of youth reach out unerringly to the heart of youth and lift it up to the level desired by that master spirit, and a great field marshal witnessed the exercise of a power that outlasts the guns.

We know this Barrie, the playwright and novelist, the kindly interpreter of his people, the benefactor of happy youth, although probably not more than a dozen in this gathering of many hundreds have ever before seen Barrie the man.

We cheer him tumultuously as he makes his appearance upon the platform, in the line of great honor. There are distinguished people with him in that front line; but the little Scot of the Scots who, as he enters, sweeps with kindly glance the roaring ranks where "the red gowns of St. Andrews" make a great blaze of color, draws to himself all eyes. It is no fault of ours that Barrie the man is unknown to most of us until now. He has not thrust himself into public view. He has been well content to work on, it would seem, holding that if the work shall but find its place and achieve its purpose "in that great temple of His worth," the worker is of lesser concern. By his works we have known him and delighted in him, and in our delight we have dragged him from his seclusion to do him what honor we can. He has come at our call, and we have him before us at last.

We are a noisy pack, impatient of the premilinaries that interfere with our observation of him, and inclined to give short shrift to the ceremonials which stand between us and the delight of hearing this master of the written word in a speech to such a gathering as ours. What must he think of us? If he thinks us a horde of young savages, there is no sign of the thought in his friendly eyes. We note the fine hands, few if any of us realizing that at the behest of the urging spirit they have worked themselves out. The scholastic regalia of Lord Rector becomes well the short, "stocky" figure. In the pale clearness of the face, in its somewhat worn, patient lines touched with a strange serenity, we sense dimly that the way of the adventurer in the realm of creative thought is no royal road, and that the spirit of this wonder-weaver who has made of the golden filaments of fancy many fine nets, to the enmeshing of the hearts of his people, has demanded much of its abiding-place. The face, fine in its lines, is dominated by the striking brow and those steady, friendly eyes, so deep with knowledge, so wise with wide tolerance, so glowing with understanding. We receive an impression of aloofness. despite those friendly eyes. In the midst of that notable front rank, Barrie is as one apart, we feel. It is the aloofness, not of egotism, but of the explorer. It marks all men who must work alone, and characterizes the explorer of every field, inherent as it is in the call and emphasized by the calling.

We wonder what he has to say to us, he whose wit has charmed and delighted the English-speaking world; and suddenly we realize that the preliminaries are over, and Barrie steps forward to meet the measure of our hopes. He appears to have a few notes in his hand . . . . we are to learn, later, what these include . . . .and upon the ebb of a crashing wave of welcome fall his quiet tones, incisive and clear . . . .

Have Courage, His Demand

> *"I WOULD that I could provide you with a staff for your journey . . . I cannot; but perhaps I can tell you a little about it, how to use it and lose it and find it again, and cling to it more than ever. You shall cut it—so it is ordained—every one of you for himself, and its name is Courage. Courage . . . . there is nothing else much worth speaking about to undergraduates or graduates or white-haired men and women. It is the lovely virtue—the rib of Himself that God sent down to His children."*

An uneasy flicker ran across the packed audience where youth sat expectant. What was this from Barrie? Beautiful; but it hurt. This a day of revelry, too . . . . And in a flash the wizard swung open "the innermost doors," and with a ripple of joy the audience greeted McConnachie—McConnachie, the writing half of himself; the fanciful half who preferred to fly around on one wing, and dragged with him the dour, sober-sided, practical Scot. Barrie had them again in the hollow of his hand. Nor did he give them time to more than realize that in each of them there was someone resembling McConnachie, when, with a grip that was sure and compelling, Barrie lifted the great gathering to a plane so lofty, and conferred upon Youth a conception of a status so high and a responsibility so great that it almost chilled:

> *"My own theme is Courage, as you should use it in the great fight that seems to me to be coming between youth and their betters; by youth, meaning, of course, you, and by your betters us. I want you to take up this position: That youth have for too long left exclusively in our hands the decisions in national matters that are more vital to them than to us. Things about the next war, for instance, and why the last one ever had a beginning. I use the word fight because it must, I think, begin with a challenge; but the aim is the reverse of antagonism, it is partnership. I want you to hold that the time has arrived for youth to demand that partnership, and to demand it courageously . . . . That is what I propose, but, of course, the issue lies with McConnachie."*

And we laughed again at mention of McConnachie; laughed in relief, not in mirth. Youth and age in that great audience knew now that this was no ordinary occasion; age listened in tense silence for an indictment, youth for it knew not what; and some of us who were there to write were prone to forget our function and listen too. How he pierced deep into the hearts of those people, that gentle-voiced master of the minds of his fellows; and wherever he pierced he sowed some seed of future beauty, nor lingered an instant longer than necessary, and covered up the precious sowing with a laugh that lifted the pain.

> *"Your betters had no share in the immediate cause of the war; we know what nation has that blot to wipe out; but for fifty years or so we heeded not the rumblings of the distant drum—I do not mean by lack of military preparations; and when war did come we told youth, who had to get us out of it, tall tales of what it really is and of the clover beds to which it leads. We were not meaning to deceive; most of us were as honorable and as ignorant as the youth themselves; but that does not acquit us of failings such as stupidity and jealousy, the two black spots in human nature which, more than love of money, are at the root of all evil. If you prefer to leave things as they are we shall probably fail you again. Do not be too sure that we have learned our lesson, and are not at this very moment doddering down some brimstone path. I am far from implying that even worse things than war may not come to a state . . . . but if you must be in the struggle, the more reason you should know why, before it begins, and have a say in the decision whether it is to begin. The youth who went to the war had no such knowledge, no such say . . . . It is not, I think, by gentleness that you will get your rights; we are dogged ones at sticking to what we have got, and so will you be at our age."*

Young Faces Go Grim

HOW he preached to them—a student gathering on its "day out"—and how they listened! And he made them suffer, too. "The spring of the year lies buried in the fields of France. By the time the next eruption comes it may be you who are responsible for it and your sons who are in the lava. All, perhaps, because this year you let things slide." The young faces were very grim, then; and the young hearts were to suffer still more:

> *"Learn as a beginning how world-shaking situations arise, and how they may be countered. Doubt all your betters who would deny you that right of partnership . . . . I expect we shall beat you, unless your fortitude be doubly girded by a desire to send a message of cheer to your brothers who fell, the only message, I believe, for which they crave. They are not worrying about their Aunt Jane! They want to know if you have learned wisely from what befell them; if you have, they will be braced in the feeling that they did not die in vain. Some of them think they did. They will not take our word for it that they did not. You are their living image. They know you could not lie to them, but they distrust our flattery and our cunning faces. To us they have passed away; but are you who stepped into their heritage only yesterday, whose books are scarcely cold to their hands, you who still hear their cries being blown across the links—are you already relegating them to the shades? . . . . They call to you to find out in time the truth about this great game which your elders play for stakes and Youth plays for its life."*

The poignancy of the appeal was indescribable. Hardly one soul in that great hall but had memories of voices newly lost that had once sounded happily across the breezy links where the Royal and Ancient has its home. Once again McConnachie came to our relief, presenting his idea for a play featuring an old Scottish couple returning to the Senatus an illuminated scroll ex-

Hoover War Library to Hold Historic 1914-1918 Papers

Cabinet Member's Interest in Collection Begun by Stanford Brings Valuable Documents

By ANDREW R. BOONE

FOR three years now there have been arriving at Stanford University materials bearing upon the World War and its effects upon a once stable national and international life, which will serve to make the Pacific Coast the center of study by students interested in European history. The Hoover War Library, conceived in 1914 and instituted as an active organization in 1919, already contains 115,000 titles, including everything from the smallest pamphlet to complete newspaper files of several hundred issues, with material from all the leading belligerent and neutral countries.

Collection progresses at a rapid rate and takes into account many publications still being issued, since both Europe and the world realize that what has taken place since official cessation of hostilities has been but a continuation of a world catastrophe. "For the next twenty-five years," as Secretary of Commerce Herbert Hoover, an alumnus and trustee of Stanford University and donor of funds to make the library possible, expressed it, "the work of collecting will go on."

At a cost of less than $75,000, Dr. E. D. Adams, professor of history, and Ralph H. Lutz, assistant professor of history, both of the Stanford faculty, have gathered the war documents, publications, proclamations, orders and posters which today are conservatively valued at $250,000. A large mass of the material these two men have collected since Dr. Adams and his wife went to Paris in May, 1919, as a "suitable commission" suggested by Mr. Hoover in a wire offering $50,000 to start the work, has come free of cost other than transportation. This has been largely due to the fact that Mr. Hoover was at that time directing the Belgian relief, and was already a popular idol in many European countries.

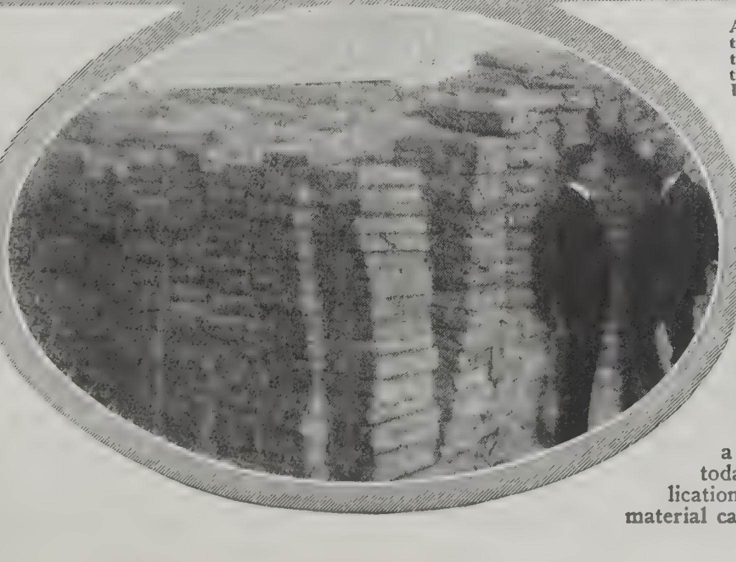
After Mr. Hoover made funds available for the library, to preserve records of any and every sort coming from the chaos abroad, his own records of the government and diplomacy of Belgian relief were already in good order. The archives of Belgian relief, the organization being termed by Sir Edward Gray as "a piratical state organized for philanthropy," became the first item of importance in the collection.

Speed was found to be essential if the "suitable commission" expected to secure Peace Conference materials of any consequence, and Dr. and Mrs. Adams took up the task of gathering the first papers and documents in Paris. Mr. Hoover, very busy carrying on the labors of the American Relief Administration, serving on the Supreme Economic Council and advising delegates to the Peace Conference, could give little attention to planning the collection, and as a consequence a meeting of the two men brought out that funds were to be had immediately and that Dr. Adams should work out his own methods of procuring the materials.

As was expected, Mr. Hoover's name (then the most applauded in stricken Europe) gave the collectors access to government and private sources, many of which contained papers and documents which were secret and which would probably still be under lock and key had not the matter of a transfer to the library on the Pacific Coast been pushed then. Dr. Adams sought first to interview all the delegations to the Peace Conference, considering that the immediate problem. He found a great plenty of what he termed "delegation propaganda," obviously intended to present claims of the various states and to influence decisions. The authenticity of this brand of propaganda was doubtful from the beginning, however, propaganda in Paris having become such an art.

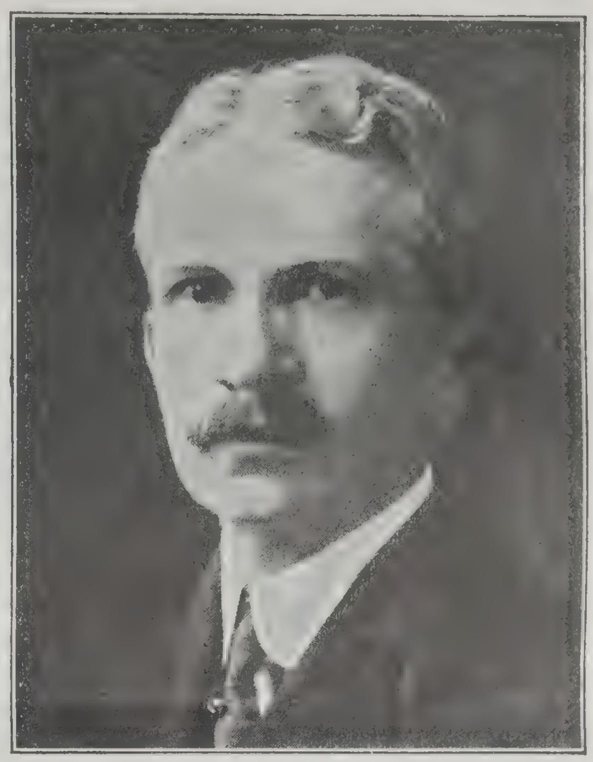
By personal contacts with the delegations, some unusual confidences came about. Many rumors came to the American historian's ears as he tramped the streets of Paris in quest of forbidden material, which cast suspicion upon the authenticity even of some men who represented themselves to be delegates from small states. In four months, however, Dr. Adams completed his personal interviews, having gathered much delegation propaganda which he classed as authentic and miscellaneous, marking each item to indicate its source. The value of the Hoover War Collection of delegation propaganda to the library today is not its size, but it is, as the collector expressed it, "the only one in existence, collected and organized on the plan of knowing what was indubitably authentic." The authentic peace conference propaganda which finally found its way across the Atlantic into the Hoover War Library came from fifty-four delegations and consists of 1,298 authentic items and 645 unidentified or miscellaneous titles. An item or title may be a small leaflet, a file of a journal, or an official representation to the Peace Conference.

Delegation propaganda was by no means all-important in giving a word-picture of events as they had been and were happening. Society publications, government documents, posters, proclamations and orders, newspapers and periodicals, war propaganda and neutral news and propaganda were found to be necessary to give the library a complete record. As far as society publications were concerned, it was first thought that material similar to that on the French Revolution at Cornell University would be collected. The field was accordingly investigated in Paris, only to reveal that "pamphleteering," as it had long been known, had largely disappeared. From an individual publication, it had become a society enterprise, and arguments, instead of being published by one person, represented the combined thought of many.



Above—Students at work in the reading room of the Hoover War Library. Oval—Hundreds of thousands of newspapers are being cataloged in the Hoover War Library. Professors Ralph H. Lutz and (right) E. D. Adams, collectors of the library, are standing beside the pile.

The society publications of more than six hundred societies in belligerent and neutral countries proved to be a fruitful field for Dr. Adams, though he later found that the Musée de la Guerre had undertaken a collection of them. These two libraries today probably have the best society publication collections in the world. Much of this material came in by gift and, despite the fact that it was very easy to obtain, is assuming constantly increasing importance in the eyes of the historians, as it shows the effects of war upon national life. Agents for the library are today seeking this type of material in Belgium and Germany, but the only countries adequately represented in the collection at present are France, Great Britain and the United States, the items of society publications approximating 15,000.



PROFESSOR E. D. ADAMS,

Director and collector of the Hoover War Library, whose suggestion led Herbert Hoover to place $50,000, then unlimited funds, at his disposal, to procure materials for this great library.

Government documents occupy an important place in the library. Before Mr. Hoover made the War Library possible, the Stanford general library contained some 35,000 volumes of government publications. From the first it was desired to obtain a fairly complete collection of documents from both belligerent and important neutral countries covering the period 1914-1919, since the neutrals were affected by the war. These four classes of documents were sought:

(1) Diplomatic publications.

(2) Military publications, showing campaigns, organization of armies, and so forth.

(3) Legislative debates.

(4) Documents in any way dealing with questions of food supply and administration.

The last of these items has been the outstanding feature of the work of the collectors, both at Stanford and in other parts of their endeavors. While they sought all available information relative to food, no efforts were spared to secure materials falling within the other three classes, and after a short experience with government officials who were unwilling to select documents from the great maze of their official publications, requests were made for everything published during the five years of hostilities.

Despite promises of government representatives abroad to see that "Mr. Hoover's library" should have all it requested, and immediately, it was not until early this year that a ton of documents were received from the Italian government at Rome. Collections of some importance were also sent by Germany, Austria, Hungary and Bulgaria. Included in the lists are many documents relating to enemy propaganda and intelligence reports, while one of the most notable collections from new states in Europe is that from Finland. The number of titles received in the government document lists totals thirty thousand.

To increase the home documents with such facility as was possible, a definite agreement was made with the Library of Congress to exchange duplicate materials. This has resulted in bringing thousands of newspapers and other important materials to the coast. The exchange lot received from Congress includes complete files of eleven American dailies and incomplete files of forty-eight foreign press newspapers, mainly Austrian and German. In size, it was a full carload of exchanges and totaled nearly 100,000 newspapers.

The collectors have gone slowly in the purchase of ordinary book material, chiefly because the Musée de la Guerre holds such a vast number of this general class. Purchases thus have brought only 10,000 items from the regular book markets of the world. Two exceptions to the slow purchases are noted, however, in "plunging" orders for Belgian works about Belgium during the war and works produced in neutral countries on the neutrality of those countries. Through the assistance of Professor Lutz, personally familiar with the Central Europe states, the library has a better book and pamphlet collection for Germany and Austria at present than for any other countries, though a recent shipment of more than 5,000 titles was organized under the direction of the celebrated French historian, Gabriel Hanotoux.

Many curious offers, some exorbitant, have been made to the collectors by foreign owners of private collections of newspaper clippings and documents. The majority of these clippings were kept by persons who foresaw their possible value, but it was only in exceptional cases that names of the newspapers and dates of publication were kept. It was difficult to convince the owners that such files had no real value. One such instance arose when a Parisian gentleman tried to sell Dr. Adams a packet of neatly bound clippings for 8,000 francs, offering in the end to trade for an American Army "seed car" (motorcycle with side car). The very

"Abattoir," Gun Club Near Wild Fowl Refuge Branded

Wholesale Slaughter of Game Clubs Foreseen If Plans for Louisiana Organization Are Permitted to Fructify

By DONALD HUGH HIGGINS

TAKE a bird's-eye view of the situation. Mallard or teal or Canada goose? Poule d'eau or pintail, brant or rail? Any of them will do.

Make it a mallard, then, popular short-legged, fat-breasted, strong-winged, juicy and succulent favorite of the wild fowl that march precisely in an air-trek twice a season up and down the aerial lanes over this long country of ours. In the autumn they start from the icy fastnesses of Labrador and travel in military formation to the salt sea marshes of Southern Louisiana. In the spring they return.

Here is what they experience as it might be told by a gun-wise old mallard leader of a duck band:

"I lead my gang from Labrador to Marsh Island twice a year during days of honking flight and nights of fugitive feeding. Each glowing morn our way is sped by murderous pellets of lead. Each long sunny day as we change formations at a high altitude over cities and villages and fertile valleys we are acting as interesting harbingers of the seasons to the thousands of human toilers beneath. Each dusk we furtively search secluded spots among the bracken where we may find sustenance and hide from monsters who would take our lives with their thunderous guns.

"For us the pilgrimage is fraught with peril. Each flying season takes its toll from our band. Our followers have numerous wounds, our forces are diminished. Gradually we are being wiped out, we, the glorious messengers of the seasons, by men with a lust to kill. And Nature's inexorable command is: 'Fly.'

"There is but one hope for us in Canada, our summer resting place; and but one in Louisiana where lie our winter feeding grounds. In the North there are men who call themselves sportsmen. They have given us what they term 'a chance for our white alley.' They have set aside a place where we are rarely annoyed and where we may gather our strength during the summer for the semi-annual gauntlet of guns. And they have forced others not so fair-minded as themselves to adopt their practice of not shooting at us during certain seasons of the year.

"In the United States, brother sportsmen of the Canadians, lovers of the beautiful in untamed nature and wise philanthropists, have done as well, or better. In Louisiana along a ragged, trackless coast they have set aside thousands and thousands of acres on which our lives are protected by law from the ravages of deadly pumpguns and automatics. Not one, but two of these refuges have they consecrated to the continuation of our race. And these two refuges, one containing 80,000 acres of marshland especially fitted for our winter feeding grounds and another comprising 85,000 acres, equally good, are only a few miles apart along the coast of the Gulf of Mexico.

"Fortunately, the land that separates these two safety grounds is so wild and untenable that only a few of the hardiest nimrods penetrate there each year and unloose their broadsides at us as we fly from one feeding ground to the other. So from both the United States and Canada there are earthbound fellow creatures who are helping to keep from destruction what we think is the finest breed of wild fowl ever fashioned by the Great Maker."

So says the poor mallard.

In his ignorance he has overlooked one element in the so-called human race, that small percentage of our millionaire population filled with a blood lust for wild game regardless of the need for its consumption. Any millionaire may hunt, of course, to his heart's content. But if he is a sportsman, he will hunt with the idea of giving his quarry a chance for its "white alley." If he is the sort who would shoot a rabbit sitting or a quail running or a deer during the reproductive season, merely for the brutal satisfaction of watching the death struggle and the vainglory of recounting the kill, then, of course, he is not a sportsman.

Needless to say, there are many such he-wolves in the United States who wouldn't mind butchering a large number of helpless ducks in the sub-tropical marshes of Louisiana, provided such killing might be done in solid comfort from a screened blind a few hundred yards away from a luxuriously appointed clubhouse where all the comforts of sybaritic life were at hand; and on condition that the game would be as plentiful as though it had been raised in a back yard and flown over the shooting place like clay pigeons.

There is only one such site for a shooting club in this country and that is the hitherto untenanted and almost inapproachable tract of land between two of the legally protected bird refuges of the Louisiana Gulf coast. Millions of ducks, geese, coot and other waterfowl seek sanctuary there during the autumn and winter hunting season of four months. They fly over this tract of land from one feeding ground to the other. And they fly in such numbers that hunters hidden there in blinds could easily slaughter them by the hundreds of thousands.

Who would want better assurance of a season's sport than to be set down there by airplane or transported by boat through a private canal dug for the purpose, put up at a magnificent club surrounded by a golf links and equipped with a cellar and a larder that would make a Cuban sugar magnate envious? Only a dyed-in-the-wool, sure-thing hunter would ask more. He would ask that lakes and ponds on this inter-sanctuary tract be artificially planted with appetizing tidbits that wild fowl love, so that the game would be certain to land near his gun muzzle.

And if he were a millionaire sure-thing hunter, much under the public eye, who had developed a taste for public approbation, wouldn't he be delighted to mask his butchery under a camouflage of philanthropy? Wouldn't it add zest to his bird murder if the public viewed it as directly the opposite; in fine, as wild bird conservation?

Seriously, such a situation confronts the United States. Such a wild game abattoir was conceived some months ago and a large amount of stock has already been subscribed. A promoter, who was formerly noted as a conservationist of wild life, is beginning to turn the mallard's safety zone into an insidiously alluring shambles for migratory fowl.

More than ten years ago the conservationists of the United States were cheered by the news that Mrs. Russell Sage had purchased an island of 79,300 acres, lying in the very heart of the wintering grounds of the migratory wild waterfowl of the North American continent, and had dedicated Marsh Island to the permanent protection of bird life.

Two years later came the news that the Rockefeller Foundation had acquired 85,000 acres of marshland, some miles west of the Sage purchase, designed by nature for the winter harbor of the same sort of game birds.

The acquisition of these two great tracts by northern capital was the result of a campaign for conservation initiated by a Louisiana man, Edward Avery McIlhenny, and he was given full praise by wild life lovers as well as by practical conservationists of this country and Canada for his commendable efforts.

Four years ago, under legislative act, these two wild life refuges were accepted by the state of Louisiana by deed from the Sage and Rockefeller foundations and added to a smaller tract of 11,000 acres donated previously by Charles Willis Ward, a wealthy Michigan lumberman who also was interested in conservation measures by Mr. McIlhenny.

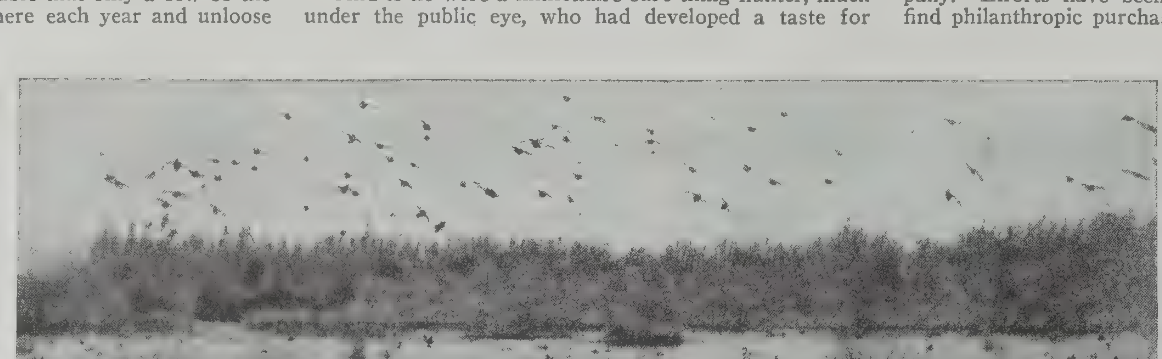
The three wild life sanctuaries extend along the Gulf coast from Marsh Island on the east to the Rockefeller tract on the west but there is a bit of territory between the tract donated by Ward and the site of the Rockefeller refuge. This territory comprises about 137,000 acres. Of this acreage, 57,000 acres is known as the Vermillion Bay Company tract, but is sometimes called the Ward-McIlhenny refuge. It was never dedicated to the state as a wild life refuge but was used by Messrs. Ward and McIlhenny as a private shooting grounds.

Later, through a foreclosure by a bank, the Ward shares of this company were purchased by the late Paul J. Rainey, noted African big game hunter, and the land was continued in use by him and Mr. McIlhenny as a shooting preserve.

West of this Vermillion Bay Company tract and directly between it and the boundaries of the Rockefeller sanctuary is a tract owned by the Orange Land Company. Efforts have been made from time to time to find philanthropic purchasers of this 80,000 acres as an addition to the sanctuaries.

In July, 1923, Louisiana conservationists became suspicious of the import of news items appearing in the press of the country that an aggregation of sportsmen, headed by Edward A. McIlhenny, had obtained options on this "open link" and contemplated digging more than a hundred miles of canals and planting wild duck foods on the land so that it might be used as a shooting preserve.

McIlhenny was immediately queried about the members of the club and whether they would hunt



Green-winged teal cavorting along the Rockefeller Foundation coast. No menacing guns to bother them now.

on this territory directly between the wild life refuges. He admitted that such was the intention of the membership, which is expected to include 4,000 wealthy men who will pay $1,000 each for a share of stock, or a total of $4,000,000.

Louisiana conservationists, as well as others in all parts of the country and in Canada, immediately entered strenuous protests and a caustic criticism of the ethics of Mr. McIlhenny in subverting the "safety zones" he had obtained into "abattoir traps" for the millionaire killers.

Among the nationally known men in the attack is Dr. William T. Hornaday, director of the New York Zoological Park, campaigning trustee of the Permanent Wild Life Protection Fund, and one of the foremost champions of our vanishing wild life.

The heads of the Rockefeller and the Sage foundations filed formal protests with Governor Parker, of Louisiana, and other conservationists joined in the plea that the state take some action to prevent the establishment of the club on the theory that it would turn the inter-sanctuary area into a duck slaughter pen.

Poule d'eau, as the Louisiana "'Cajuns" call them, or coots, as they are known in the North, go to the Louisiana wild life refuges each year in great numbers because they are safe from the dreaded guns of huntsmen there. If a projected club of 4,000 millionaire members is allowed to be completed on ground just between the two largest refuges for these birds, conservationists fear many such species will become as extinct as the dodo bird.

Mr. McIlhenny immediately defended his shooting club plan and denied it would eventuate as an extinguisher of wild fowl. In reality, he said, it would prove a big conservation measure. Prior to the writing of this article his last public utterance on the matter was in part as follows:*

"The wild life refuges on the Louisiana coast were established through my efforts. They continue for seventy-five miles from the east end of Marsh Island and run west, with the exception of a twelve-mile front on the Gulf Coast. The refuges include 46,000 acres belonging to the late Paul J. Rainey and myself, which, with the exception of 4,000 acres on which the owners and their friends shoot, have been protected against shooting for many years.

"There is adjoining this tract on the west, and extending to the eastern end of the Rockefeller Foundation tract, an area of 109,000** acres which has been open to promiscuous shooting. This property was recently purchased by the Louisiana Gulf Coast Club to establish a winter club, one of whose attractions will be shooting.

"The club is far more than a shooting club and it is the intention of the promoters to develop the property in such a way that much of the winter travel of tourists will be turned away from Florida and California to Central Louisiana. The property contains a beach equal to any on the Atlantic Coast and as good as that at Miami, a climate almost identical with Miami's and wild life in unbelievable quantity. With these attractions the promoters of the club feel that with proper expenditure for clubhouse, golf courses, roads, waterways and outdoor amusements they can bring a large number of northerners to Louisiana during the winter months."

Declaring that only a few thousand acres would be used for the winter resort, Mr. McIlhenny said the rest of the property would be retained by the members for the main clubhouse and for the use of hunters and fishermen.

"Since 1894," said Mr. McIlhenny, "I have spent probably more time in the study of wild life conservation and its practical side than any other one man in America. I was the first man in America to advise the establishment of sanctuaries in which wild life would be protected throughout the year and established the first at Avery Island in 1895. The area owned by the club contains only a small strip, two miles wide and containing only about one-fifth of the club acreage, where there is duck shooting, and here indiscriminate duck killing goes on, as many as 1,500 guns shooting on the strip at present.

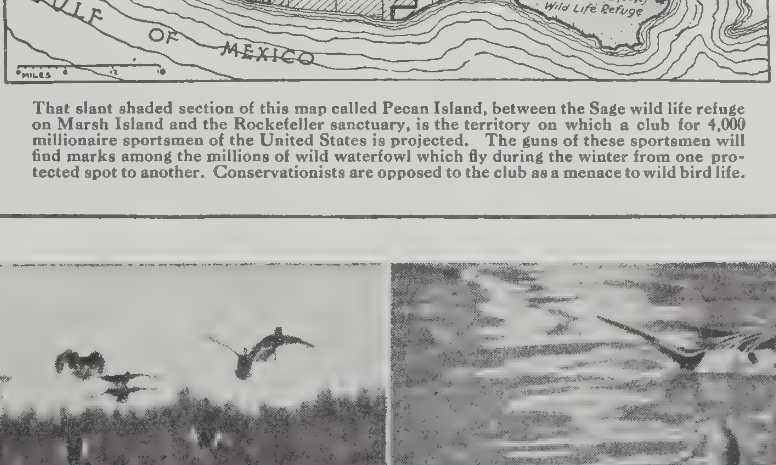
"If the club were to take over this property and confine its shooting to this small territory, the club would be a direct menace to the wild fowl of Southern Louisiana. But this club is being formed with sufficient funds to enable it to develop to the highest extent the feeding, nesting and resting areas on practically all of its property."

The plan is to construct levees around more than 60,000 acres of the property and to flood this area with fresh water, killing the native grasses, and to plant the entire acreage with duck food for a migratory wild fowl population of more than 1,000 birds an acre, Mr. McIlhenny explained. The number of birds killed by club members, he asserted, would be far less than that killed today and the members would be providing food for hundreds of thousands of birds where they killed ten.

Due to a lack of feed, said Mr. McIlhenny, the wild life refuges of Louisiana can support only a limited number of birds, but the club intends to provide food for fifty times as many birds as are found on all of the refuges together; and, he maintained, the club is setting aside 10,000 acres of its duck land to be controlled by the state as a public shooting ground. Hunters say the land so intended, however, is an inferior hunting location as compared to that intended for club members.

"The standpoint of the establishment of the club in relation to wild life protection," concluded Mr. McIlhenny, "resolves itself into the simple question of a public slaughter ground, scant food, versus limited shooting by club members, protection and an abundance of food."

In Louisiana conservationists were quick to challenge a number of Mr. McIlhenny's statements in defense of his shooting club plan. Dudley L. Berwick, commissioner of conservation, denied that the territory in question was being shot over by hunters at present and gave as his authority the statements of state wardens patrolling the section. The wardens also reported that none of the records of the department of conservation showed the game violations complained of by the backer of the shooting club scheme.



That slant shaded section of this map called Pecan Island, between the Sage wild life refuge on Marsh Island and the Rockefeller sanctuary, is the territory on which a club for 4,000 millionaire sportsmen of the United States is projected. The guns of these sportsmen will find marks among the millions of wild waterfowl which fly during the winter from one protected spot to another. Conservationists are opposed to the club as a menace to wild bird life.

Another local authority on wild life conditions in the state, Stanley Clisby Arthur, formerly the state ornithologist, objected to a number of Mr. McIlhenny's statements as misleading.

"The territory on which it is proposed to establish this shooting club is at the present time adequately protected by nature," said Mr. Arthur. "It is, south of Pecan Island, a great marsh designed by nature for mosquitoes and wild waterfowl and will remain such unless man takes a hand and opens it by canals to hunters.

"I have been on a number of parts of it and have studied the conditions there, as well as having made extensive surveys of all the state wild life refuges. For Mr. McIlhenny to state that 'at the present time' indiscriminate duck shooting is going on and 'as many as 1,500 guns are shooting on the strip at present' is a most preposterous misstatement of fact.

"Had he said that fifteen guns shot there during a winter season he would have been nearer the truth. Probably a score of trappers each winter run their trap lines in this marsh after muskrat, mink, otter and other fur bearers, and the little these trappers shoot for their tables is too small to consider in this controversy.

"However, the digging of 107 miles of canals, as Mr. McIlhenny purposes, will open this great natural refuge to the guns of many, including the 4,000 proposed club members. If the ponds and lakes in this territory are planted with duck foods, it will mean merely that the ducks on the sanctuaries on either side will be lured to the club lands and forced to fly through a barrage of lead from the guns of sports.

"The result will be that the so-called preserve will be nothing more nor less than a baited death trap for the wintering birds, and the toll that will be taken is bound to be enormous.

"In my opinion, Mr. McIlhenny's ethics are open to criticism and it is unthinkable that the state will allow such a prostitution of sanctuaries without exhausting every means to prevent it. The whole plan is a great killing scheme and the conservation of birds has a second place. As a general rule, it is not considered that killing ducks will conserve them."

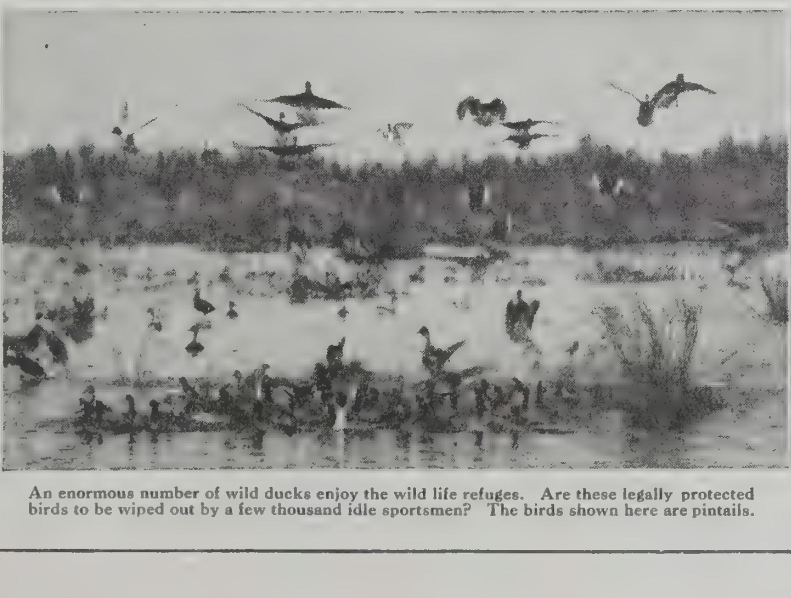
Following the flood of protests filed with him, Governor Parker announced he would investigate the "rich man's preserve" and see what steps could be taken by him in the premises. He said that, while it was doubtful whether the conservation laws of the state are sufficient to regulate the establishment of such a club, he would determine whether additional legislative or constitutional enactments would be necessary.

At the present time those announcing themselves against the club plan have confined themselves to the broad ethics of the question. If an appeal on that ground fails, many of them said a more vigorous and direct campaign against the originator of the club would be instituted and his record as a conservationist over a score of years would be closely inspected.

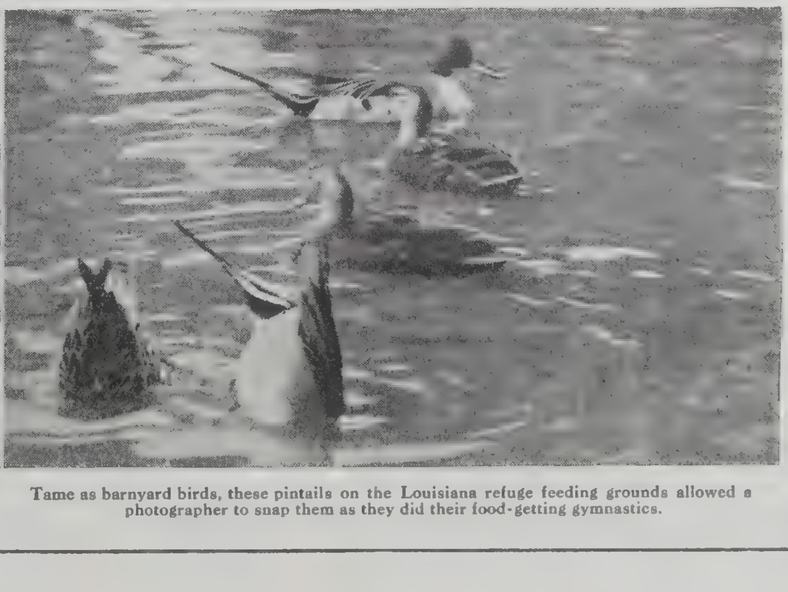
With a bag of twenty-five ducks a day and with 4,000 guns banging during the season, it is not difficult to believe that the winter's toll by this one club of millionaires would run into the millions of ducks and would mean the total extinction of many species of wild fowl. Of course, the club members would have hundreds of guests invited to the kill and under the McIlhenny scheme many hunters from the general public would be able to shoot from an adjoining tract and from less preferred positions.

That this project, if allowed to go through, will be unfair to the inland hunter who cannot afford to go South for three months to shoot ducks and that it will also be unfair to the Canadians is unquestionable. Under the terms of the migratory bird treaty signed by the United States and Canada, they refrain from spring shooting as the ducks and geese move toward their breeding grounds. Fully nine-tenths of the total duck and goose population of North America are reared within the territories of Canada, but practically all retire to the south of her boundaries each winter.

Both sportsmen and conservationists join in demanding to know why a few idle millionaires should enjoy promiscuous shooting at the expense of citizens of both the United States and Canada, and in face of the danger of wiping out the bird life of both countries.



An enormous number of wild ducks enjoy the wild life refuges. Are these legally protected birds to be wiped out by a few thousand idle sportsmen? The birds shown here are pintails.



Tame as barnyard birds, these pintails on the Louisiana refuge feeding grounds allowed a photographer to snap them as they did their food-getting gymnastics.

Wisconsin's Big-hearted Aid Goes Out to Ex-service Man

Disabled Veterans Cared for in State Hospital With Governor Leading Way to Give Succor

By FRED L. HOLMES

DR. W. F. LORENZ,

Director of Wisconsin Psychiatric Institute.

THERE hangs on the wall of the supreme court room in Wisconsin's $10,000,000 capitol building, the painting of an episode of a humble Roman legionary, who, robbed of home possessions while absent at war, was restored his rights through the gratitude and justice of the emperor.

An old G. A. R. white-haired guide, who has escorted thousands through the state house, lingers on the lesson to be drawn from the story. Recently, since the war, Wisconsin has attempted to mete out justice to the returned soldiers of the World War independent of the promises of the Federal Government.

Of the 118,000 who entered the service from Wisconsin, 8,081 have been given the opportunities of a higher education. On a basis of thirty dollars a month, the state has paid the expenses of soldiers until the maximum expended for each individual's education has reached $1,080. Nearly 5,000 have taken free correspondence courses and 500 have entered classes of evening schools. For soldiers' education, Wisconsin has already spent $3 110,679.

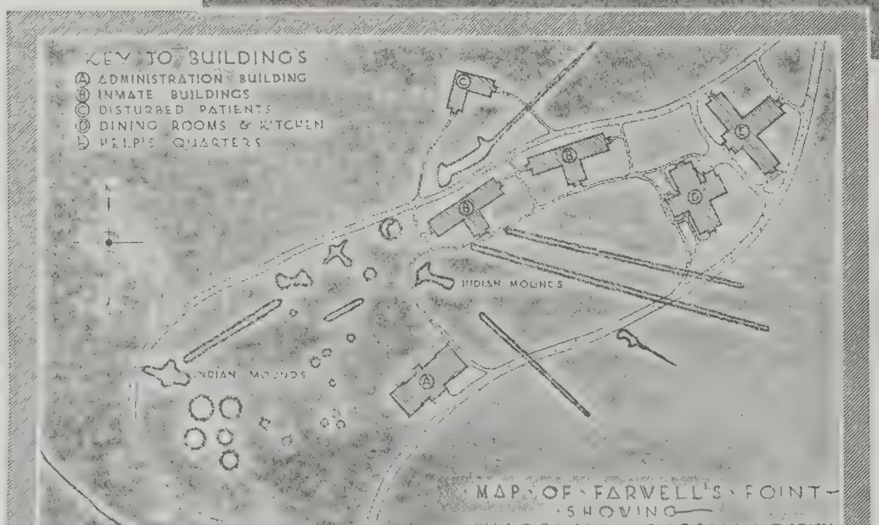
More than 100,000 soldiers have been paid a cash bonus of $10 a month ranging from $50 to $300 for each individual. An aggregate of $15,583,708 has been paid to these men.

Nearly 600 ex-soldiers have already been given treatment for "shell-shock" and mental troubles traceable to war service.

Of nearly 300 who have gone to prison for recent crimes, scores have been sent to hospitals, when their record indicated that disease contracted in war was the cause; others have been sent to institutions for special care and treatment; many sentenced for trivial offenses have been pardoned; only the few for whom science and medicine can offer no improvement will be retained.

Wisconsin is the first state to establish its own hospital for the care and mental treatment of soldiers and it is the first state to make a study of crime caused by war stains, a survey plan now being extended through a score of other commonwealths.

With the return of the soldiers, many who were taken ill at home were sent to asylums for treatment. In most of the cases physicians were attempting to handle the cases who had never seen a mobilization camp and who were not fitted to pass upon the mental ailment of these men. Such was the condition that prevailed when Dr. W. F. Lorenz, a major in the 32nd Division, returned to resume his civilian work as the director of the Wisconsin Psychiatric Institute. He immediately saw that the state had a new and menacing problem; one that the national government should perhaps handle, but a situation that must be handled promptly.



Above—The dormitory at the Wisconsin Soldier's Hospital. Center—The dining hall. Below—Location of the buildings of Soldier's Memorial Hospital showing unique mounds.

"The most important fact that could not be disputed by anyone was this," declared Dr. Lorenz recently. "To Wisconsin alone more than nine hundred men had been discharged from our various camps as unfit for further military service because of nervous and mental troubles. I estimated that one-half of these might be expected to have difficulty in their subsequent civilian life and would require treatment at a hospital. We would then have to provide for approximately four hundred and fifty of these men alone. Then there were the divisions from overseas and I estimated that another three hundred and fifty should be added, making a total of approximately eight hundred soldiers from Wisconsin alone who might require special care and treatment.

"From this estimated eight hundred, I deducted for deaths due to subsequent physical complications, also deaths due to suicides of which, incidentally, there were not a few; hesitancy on the part of parents to hospitalize their sons and other reasons that might not be foreseen, about one hundred men, leaving as a conservative estimate seven hundred veterans for whom hospital facilities had to be provided."

Meantime the national government was agitating the hospitalization project. Finally, out of a number of proposals came the suggestion that the Federal Government build a hospital of 1,000 beds for the eighth district composed of Wisconsin, Michigan and Illinois.

The inadequate program convinced Governor John J. Blaine that the state must step in and handle the problem if relief were to be granted the soldiers before it was too late. Early in 1921, he authorized Dr. Lorenz to complete his tentative hospitalization survey and the matter was placed before the legislature.

When the facts had been presented, the legislature passed a bill establishing the Wisconsin Memorial Hospital. A committee of the legislature located the institution on one of the scenic spots overlooking Lake Mendota—an eminence that comprised fifty-three acres used centuries ago by the Indians as their ceremonial grounds.

"Since 1920, when the Wisconsin Psychiatric Institute was designated as the place for the treatment of ex-service men, a total of 579 ex-service men have been handled," declared Dr. Lorenz recently. "This incidentally shows that our estimate of more than 700 for Wisconsin alone is conservative. Within three years after the war, we already have treated within one hundred of the number we estimated in 1920. At our present rate of admission, we will pass the 700 mark within a year.

"Of the 579 cases admitted, 232 or forty per cent have been discharged as recovered or very much improved. Contrast this with the usual recovery rate at state asylums. The latter rarely go beyond twelve per cent. These facts should convince anyone of the needs of the best medical treatment at the earliest possible moment. Possibly in justice to the state hospitals, although few have any right to the term of hospital and should be referred to as asylums, the medical conditions that they handle are different. In the first place, the age of the patients coming to the state institutions, on the average, is much greater than that of ex-service men, and the factors that brought about mental upsets operated over a longer period and were not such special and unusual circumstances as obtained during the war."

Governor John J. Blaine appointed Dr. Lorenz and Dr. W. S. Middleton, associate professor of clinical medicine at the University of Wisconsin, to conduct a survey of all ex-service men in the penal institutions. They found 225 ex-soldier inmates, 91 at the Green Bay Reformatory and 134 at the prison.

Here are some of the more startling facts revealed by that survey:

"At the state prison, sixty-two per cent of the ex-service men are mentally abnormal. At the Green Bay Reformatory, forty per cent of the ex-service men are mentally abnormal.

"The criminal offences were concerned with property or money in more than seventy per cent of the cases at both of the prisons.

"At the reformatory, ninety-seven per cent of the ex-service men had pleaded guilty when arrested. Sixty per cent of those at the state prison pleaded guilty.

"The offense committed was regarded as trivial in sixty per cent of the ex-service men at the prison and sixty-eight per cent at the reformatory."

Governor Blaine transferred a number of soldiers to institutions for the care of the feeble-minded; others to hospitals for treatment for tuberculosis and physical ailments; others were pardoned because their incarceration was traced to military service.

The Wisconsin idea of justice has again been exemplified in the handling of the soldier problem. The state has placed the man above property; the human element above all.

Mr. Ford's Page

IT MAY be set down as true that the Government does not know, and maybe does not want to know, the full extent of the farmers' troubles. To know them to the full extent would merely show how useless are the methods adopted to relieve them; it would also disclose a situation which all possible political scheming could not relieve.

This is not an anti-governmental statement. The Government is no wiser than the men who control it. Not the men who comprise it, because in the under-ranks in the Government there are men who clearly see what the trouble is and what the cure. But they are without power to act upon their knowledge, and in many cases if they even gave a hint of the inclination of their minds they would be instantly dismissed. These men are employes of the government, they remain over from administration to administration, they are specialists. They differ from those who control the government in this—they are more interested in their job than in the next election.

> *HARD work alone does not accomplish much. No work is harder than wearisome motions that get nothing done. It is a strange law that the larger the accomplishment, the less the work. Efficiency and method and achievement seem to simplify work, so that with the same effort more is done. Work should be measured by what it gets done. Hard work on the farm is a byword, yet where has hard work accomplished so little as on the farm? With better methods and less labor more real work has been done with less strain than under the old system where men worked harder and longer than the horses. Work mixed with management becomes not only easier but more profitable. The time is past when anyone can boast about "hard work" without having a corresponding result to show for it.*

Without doubt a complete exposure of the actual conditions of agriculture today, coupled with an honest confession of the inadequacy of present political methods to cope with it, would mean the defeat of any party in power. It would mean also the condemnation of previous administrations for permitting the present conditions to grow. The early development of abuses should have been noted and checked years ago. These conditions are not attributable to the war nor to any emergency but to a lack of alertness on the part of those who were selected to stand upon our national wall and keep watch.

The very agencies set up by the government ostensibly to deal with the agricultural difficulties have no information as to the extent of those difficulties; and the opinion is ventured that if those agencies should seek this basic information, higher authority would prevent it. Why? Because just now, for political purposes, the party in power (it is a far better name than Government, in such a case) can point to these supposedly curative agencies, even though they cannot point to any curative results. The American people have been so accustomed to assume that agencies actually perform the work which they are advertised to perform, that it is very easy to fool them by simply creating an agency with a sounding title.

That, however, is the governmental end of the difficulty, not to be explained away by official indignation nor any form of speechmaking.

For the present, the farmer's only hope is in himself and his fellows. Of course, many of the farmers now in difficulty are not farmers at all. That is, they are the victims of some "back to the land" propaganda of a few years ago. They were told by statisticians that people were leaving the farms at an alarming rate and that the country could be saved only by others taking their places. On much the same false promises which lure emigrants to America, Americans were lured to take up land and start farming.

They did not know that the movement from the farm was natural, that farming under modern methods requires fewer men than before. They were victims of a misinterpretation of the facts. It is only recently that the Department of Agriculture of the Government has turned the whole problem round and stated that the problem was to get the proper number of people off the farm and into diversified industry.

There are, however, farmers born, who will always be farmers because it is their gift. They belong to the farm, and their plight in many cases is not as bad as that of their neighbors. And if they can but see what is before them, and what is the status of farming at present, the situation will be speedily remedied from within.

For one thing, it should be seen that farming is presently to cease being a single industry, such as food raising, and is on the threshold of becoming an industry of diverse interests. The world's food supply is more than amply provided for. Overproduction is evident on every hand—a fact which condemns the lack of supply in many quarters due to the selfishness of the present distributive system. On the production side, the food supply is overdone. Farmers feel the result of that. But shall the farm be used only to raise food? Has it no part in raising the materials needed in our industries? All the signs of the times indicate that this latter part will be forced in by new developments trembling on the verge of practical use.

It is not at all impossible that motor fuel will one day be a seasonal crop raised on the farm. Oils and fuel alcohol may presently become field and garden products. An acre of potatoes will yield enough fuel-alcohol to plow that acre for a hundred seasons. It is not impossible that the rubber supply so necessary to modern industry shall one day depend on the farm. Weeds which are now spurned may turn out to be valuable for cultivation and harvested for their yield of the elements of rubber. We have by no means begun to understand what the soil shall yield.

Co-operation, as now applied to the farm, means mostly co-operative selling. That is putting the cart before the horse. Co-operation should begin in production. There is hardly any of this kind of teamwork in America. A field of corn and a field of wheat, a bit of this and a bit of that, a team of horses and half a dozen cows—and this endlessly repeated all over the country—spells needless waste and work. A few pigs here and a few sheep there, odds and ends of every department of farming scattered about the countryside—this is not farming. It is not best for the farmer and it is bad for the country. The pigs must be shipped hundreds of miles to be turned into bacon, the bacon is sent back to the very spot where it was raised; the farmer loses the bacon profit and is compelled to pay the bacon price; doubling the railroad hauls and the freight rates;—the same with wheat and dairy products—all these abuses could be abolished by co-operation. Wheat pools in Chicago can be defeated by flour pools in the country district. Pool the cows under competent management; cure the bacon in the district where it is raised; complete the dairy processes on the ground; go into business co-operatively for the common benefit. It can be done, and it is going to be done, if not by the farmers then by those who are waiting for the farms to fall into their hands.

Nothing is more frequently asserted than that the farmer works hard. Of course he works hard. There is no harder work in the world than that done on worn-out principles. No work is harder than that which yields an insufficient profit. It would be very beneficial if the farmer would begin to analyze his hard work. Every farmer knows men who work from before dawn until after dark, and work hard—without accomplishing much. It isn't sufficient to work hard, to endure physical strain and fatigue; it is essential to accomplish something. And this is what every good manager knows—on the farm as elsewhere—that work undertaken to get something worth while actually done, is the kind of work that tends to become less burdensome. Having a definite object, the work simplifies itself, discovers better methods, besides yielding to the spirit of man the refreshment of seeing his work actually telling on the task.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

As Citizens, Not Partisans

CLASS parties are futile. Many of the abuses inherent to a democratic form of government, it is true, are due to combinations of voting groups inspired by class-interest, and the desire to correct them through counteraction of the same sort is natural, hence excusable. Yet in the end only failure may be looked for, unless the abuses complained of become so flagrant as to arouse general opposition; but in that event it is not class action, it is the real spirit of individual sovereignty, that achieves the desired result.

True American citizenship is a matter of conscience. Any effort to create a distinct party for a single class would only be met by opposition from all other classes, some of which have mutual interests. Independent voters cannot be delivered into political bondage even under a new name. Masses who can be led against universal principle and into narrow purposes will soon enough find leaders whose interests will be for one or another form of personal gain.

It is astonishing to find how universally "partisanship" is denounced, on the supposition that one can be a "partisan" only in a political sense. To be a "partisan" means to put "party" above everything else, and "partisanship" is always the same whatever source it may have.

The highest privilege of American citizenship is individual sovereignty, the right to decide for one's self. Loyalty to class, sect, race or sex is not to be discountenanced but it can never be the basis of enduring political action. Taken without a justifying conviction, or in a blind following of prejudice, such loyalty can only weaken the class clause, if there really be one.

Coolidge on Transportation

THE President has suggested a reduced rate on wheat for export. He is also reported to have suggested an equalization of rates on coal for export and for the New England States. The cost of transportation should have but one basis—actual expense plus a reasonable return for actual investment in physical value. Measured in actual service and investment, and allowing for depreciation, railroad freight rates could be lowered without involving loss. The service cost is the same, whether the cargo is for domestic use or export. There is no reason for the distinction which Mr. Coolidge makes in wheat shipped for export.

An Easy Way to Help Presidents

PERHAPS one way to lighten the load of our Presidents is to prohibit them from making those trivial addresses by wire and correspondence with which they greet the Amalgamated Society of Sausage Makers and other worthy groups in convention assembled. Mr. Coolidge's experience along this line has been singularly unfortunate from the beginning, and reports of several such greetings a day ill consorts with the character for taciturnity behind which it had been hoped to build up a reputation for wisdom. That is not to say, of course, that the President is not taciturn; it may be that most of these reported greetings are prepared by a department of his office set apart for that purpose. But the two go ill together.

It is easily understood how sometimes a President is verbally bludgeoned into doing things he would much rather not do. Mr. Coolidge can scarcely be made to say anything he does not mean, but there are signs that he can be made to say when he would rather not say anything. On such occasions what he says is likely to be meaningless. It would be interesting to know the circumstances attending the statement issued to the American Jewish Congress at New York. It was not so much a statement by President Coolidge as by Rabbi Stephen Wise. It contains the most general of generalities, the most platitudinous of platitudes. It is plain that the President could not refuse to say something, and just as plain that he was not willing to be made an adjunct of the American Jewish Committee as other Presidents have been. The report read to the Congress says, "When told that it is felt in Jewish circles that the immigration restrictions bear especially hard upon the Jew" (which every fact contradicts, the Jew being the only possessor of super-legal power in migrating anywhere) "the President stated: 'This administration will continue to refuse, sanction or tolerate any anti-Jewish discrimination in the matter of immigration, or in any other matter.' "

The story of the composition of that paragraph would be worth having. Is it Calvin Coolidge's paragraph, or is it the amputated limb of a longer and stronger declaration proposed by Rabbi Wise? And what does it mean? Does it mean anything? Has any recent administration shown anti-Jewish discrimination? As for the Coolidge administration it has had nothing to do with the question as yet. What does the declaration mean, anyway? It means just this—that something had to be said to satisfy the importunity of the Jews, and Coolidge said as little as he possibly could, without giving offense.

Taking the literal meaning that the Coolidge administration will not sanction any discrimination at all in the even-handed service it will render the people, the statement could just as well have been put in this fashion: "The President stated: 'This administration will continue to refuse, sanction or tolerate any pro-Jewish discrimination in the matter of immigration, or in any other matter.' "

The pledge of even-handed service would have been exactly the same, but would the President have said it? Would the Jewish Committee have accepted it? No. Why? Because in the latter form, the pledge would have had a meaning. There is *pro*-Jewish discrimination. In the present form, however, the statement has no meaning, because in this country there is no *anti*-Jewish discrimination.

The best way out of the whole silly business is to occupy the President's energies with more important matters.

Air Hindrances

IN TAKING an air tour over Europe, H. G. Wells discovered two items of information that are worth knowing. First, he found that "private enterprise flying" was in a low state of efficiency, due to poor care of the air vehicles, he claims. Not once did he succeed in escaping serious engine trouble, not once did he find time-tables observed in practice, and in several cases he found the aerial transport companies utterly unable to fulfill any of the terms of their advertisements.

Second, he found that the political subdivisions of Europe were a hindrance to any Continental plan of transportation. The same conditions which have made the network of European railways mere military services with hardly any reference to commercial needs, have reached into the air, so that, as Mr. Wells says, if there are 40 aerial services organized by as many countries, each service thereby inherits 39 enemy organizations which try to wreck it. The mutations of Europe, with boundary lines every little way, each boundary line a collection office for the maintenance of a separate aristocracy, a separate government, a separate army, have had the effect, as everyone knows, of holding Europe back on land, and is now seen by Mr. Wells to be equally menacing to European progress in the air.

Mr. Wells, therefore, deduces that although Europe is in much greater need of aerial service than is any other part of the world, the future of aviation as a public service will undoubtedly depend on the enterprise of North and South America. He even intimates that Central Africa would be a much better field for development than is Europe, because in the latter area so much stupid national jealousy exists. In so saying, Mr. Wells is only repeating the history of all inventions. Britain with her widespread territory and organized empire presents the premier field for development, with the United States proceeding at equal strides. There is more than sportsmanship, more than engineering at work on this problem—destiny, too, has something to do with the urge of our people to take to the air.

Rich Men Only Need Apply

THE simultaneous resignations of two American ambassadors to major European countries arouse again the national concern over the circumstances which limit the membership on the ambassadors' eligibility list to rich men.

There have been some rumors of friction between the State Department and the envoys who are to retire. Regardless of these reports, it is admitted that financial considerations played some part in the movements of both Ambassador Harvey and Ambassador Child. Colonel Harvey, it is explained, spent much time in the United States to avoid heavy expenses of the London court season.

The salary of an American ambassador is $17,500 annually. It is not enough to support an envoy and permit him to respond properly to the demands which are made upon an embassy.

The American public probably would not look with favor upon high salaries for ambassadors. But the evil of permitting the continuance of a condition which makes it impossible for other than a wealthy man to take the posts at foreign capitals is patent. A start has been made toward the purchase by the government of homes for the American envoys. It would seem possible for the State Department to devise some plan whereby an ambassador's legitimate expenses could be provided. Some of the ministers to the smaller foreign countries have risen from the ranks in the diplomatic service. It should be possible for a consul or legation attache to look forward to a career which might lead to the post of Ambassador to the Court of St. James. Until the government provides adequately for the upkeep of its embassies out of public funds, such an ambition on the part of a poor man will be idle.

"Government, Greatest Industry"

OUR greatest industry, says the Kansas City *Times,* is not the steel industry, the farm industry, the automobile industry nor the motion picture industry; our greatest industry is government! "One-twelfth of the working population of the United States is engaged in the business of government." For every twelve persons, one is working at "government." Every American works fifty days in the year to support this great host. Fifteen per cent of every American dollar is sliced off to pay them.

Every Congress sees scores of attempts to increase this Army of the Public Pay Roll. Even babies cannot be born now without representatives of the government near by. If another bill passes, children cannot learn their Three R's without representatives of the Federal Government near by to watch them. We are establishing with dangerous rapidity a class whose interests are so intimately connected with the continuance of things as they are, that the people will be helpless. Already this Government Class has completely lost the idea of being servants of the people; they do not exercise *service* toward us, they exercise *control* over us. The situation is so bad, and promises to grow so much worse, that someone must risk the reputation of being a calamity howler in order to call attention to it.

"Too much government" always means not enough good government.

A Vexed Question

THE proposal of the Department of Labor that all aliens be registered will be fought bitterly by influences which favor the dis-Americanization of America. Opposition to selective immigration has practically ceased to argue its case though it has not ceased to work against perfecting the laws which seek to restrict foreign immigration.

The Chairman of the House Committee on Immigration wishes to amend the Dillingham law to provide that the 1890 census be made the basis on which the percentage of eligible immigrants is determined. He wishes also to remove some of the arbitrary provisions of the law which might be interpreted as a means of breaking up families.

Whether Congress will amend the present law as Representative Johnson suggests is a question. Alien influences will be eager to hamper the work of perfecting the restriction law. But the thing on which they are likely to concentrate their opposition is the proposed enrollment law. The "bootlegging" of immigrants from adjoining countries has admittedly reached vast proportions. President Coolidge referred to it in his speech to the governors. Many thousands enter this country illegally each year. Congress must establish safeguards against the "bootlegging" of aliens; otherwise, the finest restriction law which may be devised will be utterly worthless. The country should watch the interests which oppose the alien registration law.

68, Eligible for Pension, Heads Great University

Ernest De Witt Burton, of Chicago, Builds for the Future

By J. V. NASH

TO PARAPHRASE the old aphorism about peace and war, age has its victories as well as youth. An instance has just occurred in Chicago, where the fellow with the youthful punch and pep is supposed to have things all his own way, more or less.

The University of Chicago, one of the biggest educational institutions in the world, was looking for a new president—a man qualified to take on the job of managing a $50,000,000 educational plant, supervising research and other activities of the most far-reaching importance, giving inspiring leadership to approximately 12,000 students, and carrying out a building program which should involve the expenditure of many additional millions, a part of the said program having to do with the construction of a beautiful chapel-quadrangle, and a medical school group of buildings, including a hospital and laboratories designed to attack the problem of disease with the latest and most complete scientific equipment, to be a model of its kind.

For a year or more the board of trustees, numbering in its membership some of the leading business men of Chicago, canvassed the entire country for a suitable candidate to fill the office of president of the university. It was quite generally understood that a young man was desired, and the younger—other things being equal—the better. Many an ambitious young dean or professor, both at Chicago and elsewhere, was coyly watching his mail for a letter bearing in the upper left-hand corner the cryptic words: "Board of Trustees, University of Chicago."

And so it was something like a bombshell thrown into the community when the newspapers, one morning several months ago, announced that the trustees, after having given all the likely young fellows in the educational world the "once over," had come back home and unanimously agreed upon the selection, as acting president, of Professor Ernest De Witt Burton, a silver-haired clergyman and writer of books on the New Testament, who for thirty-one years had quietly awaited the call to service in a position of national prominence while faithfully discharging his duties as a professor in the divinity school.

So quietly, indeed, had he gone about his duties all these years, that many, even in the university community, had scarcely heard of him. But the trustees had long had their eye on him. In 1910 he had been appointed director of the university libraries, one of the greatest collections of books in the country. In this office, too, which he held along with his professorship, he submerged himself in the job, while the limelight played on those who sought it.

That his worth, however, was known not only to the university trustees, but to the outside world, was proved again three years ago, when in 1920 Harvard University conferred upon him the honorary degree of D. D., which he already held from Denison and Oberlin.

When Dr. Burton took up his duties as acting president of the university last February, he had entered his sixty-eighth year. At sixty-five he was eligible to retire on a comfortable pension and live at ease among his books for the rest of his life. But Dr. Burton believed that life meant service, and worked on without thought of retiring. And so when the call came to newer and heavier duties than any he had as yet borne upon his shoulders, he was ready, and accepted the summons with gladness. Although the hair brushed back from the thoughtful brow was silvered, there was still a youthful twinkle in the kindly eyes, and the slight figure was still upright in carriage and firm of step.

Dr. Burton brought to his high office such a winning personality and performed its strenuous work with such ability, combined with apparent ease and pleasure, that any possible misgiving on account of his age quickly vanished. Before the beginning of the present academic year the trustees lost no time in confirming him in the office of president. There being now no religious test for that office, the appointment was clearly based on personal merit and fitness.

At the One Hundred and Thirtieth Convocation, Dr. Burton was installed as permanent president of the university. A pleasing tribute from youth to age was given at the ceremony of installation, which was presided over by the president of the board of trustees, H. H. Swift, of the firm of packers—a man in his thirties and a university alumnus.

Space prevents here any attempt to give a biographical sketch of Dr. Burton. The high points in his personal history, together with a list of the books he has published, will be found in the latest edition of "Who's Who," in which he had already, before his recent notable appointment, achieved a good half-column.

Dr. Burton's specialty being the interpretation of the New Testament, it will be interesting to know his views on the Bible. His attitude, while reverent, is progressive. He sees in the Bible not a static legacy from the past, but rather a source of living inspiration, pointing the way to the attainment of new and greater truth. In this connection he points out:

"The Bible is not a compendium of truth, nor even of theology. It is a record of religious and ethical experiences, rather than the last authority and a composition of all theological truth, such as it has been held to be by most churches. Taking the Bible at the beginning and following it through, we find it ever changing, according to the conception of the times. We cannot take it as a compendium and, opening it, say: There is the law, there is the truth."

In oval—ERNEST DE WITT BURTON, D. D., new president of University of Chicago. New chapel-quadrangle, University of Chicago. The tower is 216 feet high.

Speaking of his outlook for the future of the great university of which he is now the recognized leader and spokesman, he says:

"In my judgment the policy of the future is to be one of inclusion, and not of exclusion; of progress, not of radical change. I say this deliberately and with definite meaning. If it were true that we had expanded unduly, if we were doing too much for our capital or for our community, if we had undertaken more work than we could do well, as I am sure institutions of learning often do, I should not hesitate to propose a policy of retrenchment, of taking in sail.

"I am by no means an advocate of indefinite expansion. I do not for a moment think that we should measure our success by the number of our schools, faculties, buildings, or students. But looking at the university as it is, speaking not *a priori* but on the basis of facts, I say deliberately that our policy should be one of inclusion of all we have, not exclusion.

"It has been intimated, I am told, that we cannot conduct both graduate work and undergraduate work and do both of them well. I know that there is enough in the experience of other institutions to lead us to think seriously on this matter, before we decide on our policy. I believe we have done some serious thinking and that we are now prepared to say that we have no occasion to do away with our graduate school or with our colleges, or with any of the major divisions of the university. In a recently published article, Dr. Henry T. Pritchett, after pointing out the very dangers of which I have been speaking, and the difficulty of conducting graduate and undergraduate work in the same school, adds that the University of Chicago has succeeded in maintaining the two side by side.

"The university will continue to put strong emphasis upon research. Research is no new thing with us. Dr. Harper emphasized it at the beginning and we have practised it all these thirty years. Our roll of honor, both of men and of achievements, is a long one.

"Luckhardt, our associate professor of physiology, a product of our own university, who in seventeen years of service in our laboratories has taken but one vacation, has recently discovered a new anesthetic of which you are likely to hear a great deal in the future. It is called ethylene. It induces anesthesia and analgesia more quickly than any of the older anesthetics, produces no appreciable unpleasant or injurious effects, and recovery is very rapid, usually without nausea or other undesirable effects. It has already been used in 118 operations of a wide variety of types, always with most happy results. It seems certain to displace all other anesthetics, and to add greatly to the comfort and success of surgical operations.

"In the department of paleobotany, Professor Noé has been doing some remarkable work. In his visits to certain coal deposits in Indiana, he has discovered 'coal balls.' This means material that can be sectioned, so that we can reconstruct the carboniferous flora. Coal balls have never been found in this country before, but their discovery in England has put the carboniferous flora almost entirely in the hands of English workers. The study of these Indiana coal balls has only just begun, but already some startling results have been reached. Our so-called flowering plants have always been thought to be relatively modern. But in a section of one of these coal balls there have been found fossils of flowering plants, and this fact alone shows that these plants are a great many million years older than was previously supposed.

"I am sure I do not need to argue concerning the value of research. It is what distinguishes modern life from medieval. To it we owe all the wonderful inventions that characterize our modern way of living—the telegraph, the telephone, the electrical engine, the automobile, the airship, electric lighting, and a thousand other conveniences. To it we owe all our recent progress in medicine and surgery.

"But research does not belong to the physical sciences only. It is equally appropriate in the field of history and the social sciences. Indeed, unless research on the physical side can be matched by a corresponding progress in the humanities, unless society learns how to manage itself at the same time that it learns how to harness nature, progress in the physical sciences may literally be the death of us.

"Because this is so and for many other reasons it will, I am sure, be the policy of the university to encourage research in the field of the humanities, and to expect that in the next thirty years we shall make a record in that field equal to anything that has ever been done in the field of the physical and biological sciences.

"There is much that we need to know in respect to methods of doing business, not only with profit to the doer, but with benefit to the whole community. There is much that we must learn in respect to the relation of laborer and capitalist, and of the various social groups to one another; in reference to the conduct of political affairs, in city, state and nation; and on the plane of international relations. And nothing can be learned without patient research.

"The American college was founded on the pattern of the small college of England, a small group of students living in close contact with a smaller group of teachers. Harvard is said to have been patterned after Emanuel College, Cambridge. But whereas in England when they got beyond the limits of their quadrangles they founded another college, till Oxford has about twenty and Cambridge nearly as many, in America we simply took off the limit. We did with our colleges what later we did with our buildings—took off the roof and made skyscrapers. But when you make a small college big you have lost some of the essential qualities. Five children make a family; 500 an institution! As you get bigger you substitute elaborate rules and standards for personal touch.

"I am quite sure, however, we are not going to solve the college problem by abandoning the college or by converting the university into a research institution with laboratories and a research faculty, but no students. The research institute has its place, an important one, and research is to have an important place in the university. But we are building a university and a university is a research institute plus—a very large plus. And a part of that plus is an interest in people, the production of men and women of character and power. We have no thought of giving up our colleges.

"In the second place, I am sure we are never going to solve our problem simply or chiefly by reducing numbers. You cannot crowd the skyscraper back into the log cabin. You cannot make a grown man youthful by hunting up his childhood clothes and trying to put them on him.

"In the third place I am confident that we are not going to find the solution of our problem by eliminating from the college the element of sport or of social life or of the so-called activities. All these are a normal part of life—and because they are, they are a normal part of college life.

"Perhaps some day we are going to find a way of grouping our thousands of students into smaller groups, each of which will to a considerable extent have a common life, be something like the old medieval guild of scholars, where pupil and teacher mingle together and you do not always know who is teaching and who is being taught."

Subsidy Bill a Sieve of Loot With Taxpayers Victims

By A WASHINGTONIAN

This is the second of several articles having to do with conditions in the U. S. Shipping Board. Another will appear in an early issue.

THE one and only outstanding attempt on the part of Lasker to make any real change in the deplorable and super-costly condition of the Shipping Board, the Emergency Fleet Corporation and the rotting fleet was the subsidy bill which he sponsored, fought for, and used the people's money and the people's machinery of government to try to jam through Congress —and failed.

When Lasker proposed the subsidy bill, he also threw the fleet of ships on the market at a time when he and his "experts," all high-priced ones, by the way, said, "there is no chance in the world of selling a ship today at any price."

Had the fleet been sold—and the subsidy measure had passed—speculators would have reaped double or triple their money through the increased price of tonnage with such a prize as the subsidy and the indirect aids put into the package.

In Section 201 of Lasker's subsidy bill he sought to amend the Jones act by leaving out the word "competitive," thus setting aside any competition requirements in the sale of the ships. Under this plan private interests might at their own prices have got the cream of the tonnage, while others, offering even more, perhaps—*and there are instances of this very thing*—would have been excluded. This part of the Lasker measure meant simply that if the bill had passed the Shipping Board could have sold the boats without advertising, without notification of sale to anybody interested in the purchase of ships, without competition in bidding or in offers. The sales could have been made on any terms the board might have prescribed. The board could have deferred payment of both principal and interest on the ships to the fifteenth year after the contract of sale was signed; it could have established the interest at two per cent. The depreciation of the ships in operation is five per cent a year, so at the end of the 15-year period the ships would have been depreciated seventy-five per cent and the buyer would have paid interest in the sum of thirty per cent—the people being left utterly without protection on a forty-five per cent depreciation of their fleet—or such of it as was sold.

Millions Gone, More Wanted?

THE way was left wide open for a repetition of performances such as those of the Green Star, the Nafra Company, the United States Mail, the Baltic and numerous other companies which bought ships, made small down payments, got interest and payments deferred, operated the ships, took off the profits, in some cases did not even pay the ships' bills but let the vessels be libeled for debt, forcing the Shipping Board to pay the debts and take back the ships from some remote quarter of the globe to protect its mortgages—or else lose ships, money and all. Many, many millions of the people's money was lost this way—yet Lasker fought to continue that method.

To evade necessity of further advertising, and that the lowest possible bids might be secured as a standard upon which to base the ship prices after the subsidy bill was passed, Lasker threw that fleet on the market when he did, advertised it when he did, and received the bids when he did—and the authority for this statement was none other than Lasker's co-member of the board at the time—Commissioner Meyer Lissner.

In section 202 of his bill Lasker proposed a construction loan fund of $125 000,000 to be loaned private shipowners to build new or to reconstruct old tonnage. These special interests were to be charged *two per cent interest,* and were to be loaned up to *two-thirds* the cost of their new construction, or two-thirds the value of their reconstruction. *But Aaron Sapiro or Eugene Meyer had not proposed anything of that sort for the farmers.* Would the farmer—who in mass owns most of these ships and most of that $125,000.000 Lasker wanted to lend at two per cent—be glad to have a fund of $125,000.000 he could borrow from up to two-thirds the cost of his farm and improvements at two per cent interest? Just ask him.

The board held electric railway bonds, housing project bonds, shipyard bonds. It would have been possible under that section of Lasker's bill for the shipyard companies and other makers of that paper to have bought back their bonds, on which they borrowed 100 cents on the dollar from the Emergency Fleet Corporation during the war, at seven to nine or ten cents on the dollar—and it would be interesting to know whether any of those bonds did reach their makers at about that percentage, anyway. And, conceivably, the makers of those securities could have borrowed from the merchant marine construction fund—to build or to reconstruct ships, of course—at two per cent interest, the money which could have been diverted to buying back those bonds at less than ten cents on the dollar.

"To the extent required," as the clause was worded, meant anything the board saw fit to lend. The board under that clause could, to favored interests, have extended the time of the loans to any term of years it saw fit—20 or 25 years, perhaps—and could have allowed the payment of both interest and principal to be deferred—as was done time after time by previous boards—to any term it saw fit.

The failure of a concern borrowing under those conditions would have involved tremendous losses to the government—as tremendous losses were involved in many, all too many, instances under just such circumstances. Former Shipping Boards, under pressure from persons with heavy political backing and strong influence did do those things. Then, as in the Merrill-Stevens and other deals of the past, where paper was taken which later proved worthless, the firms failed and the Shipping Board "held the bag." And such things undoubtedly would have occurred again.

And, while Mr. Lasker told the country the Shipping Board could be got out of the shipping business quickly this way—*this very clause set up a condition which would have kept the Shipping Board in the shipping business for at least 15 years or longer.*

Now let us see what other privileges were arranged for the private shipowners.

In Section 203 of his subsidy bill, Lasker sought to amend the Jones act to provide—among other things—the exemption of the ship operator for ten years at least from any payment of income tax on his ship earnings, which, of course, included the subsidy the operator was to draw from the government.

Would Messrs. Sapiro, Baruch and Meyer consider a similar arrangement for the farmers? If so, they should be able to get Mr. Lasker to help put it over. Lasker told the joint Senate-House committee that "If you will give me just six months away from here I will try to help you solve the agricultural problem, too."

Under such a scheme, the farmer could buy more land with the money he thus acquired—and then borrow at two per cent interest from the government two-thirds the cost of that land. The farmer would like that, undoubtedly.

Lasker apparently didn't stop to figure of how much money this would deprive the Treasury. He seemed to think that as long as the money was not allowed to reach the Treasury, it wasn't costing the people anything.

Of course this clause didn't help the little ship operator who would have small net earnings. But it would have amounted to tremendous sums for the big operators—including some companies which operate their ships as an incidental adjunct to their regular business. But we must remember that Mr. Lasker was planning several gigantic corporations, one of which the Fleischhacker boys, bankers, of San Francisco, were to head. Lasker wasn't thinking of the little fellows—Al thinks in a big way.

Another nice little tax exemption clause was tucked into this section. It was to the effect that five per cent of the amount of ocean freights paid by any corporation or individual could be deducted by that individual from his NET INCOME TAX PAYABLE ON CORPORATE OR INDIVIDUAL INCOME.

Now, mark you, if a corporation or an individual paid out during the year a million dollars in ocean freights, he could deduct five per cent of that sum or $50,000 FROM HIS NET INCOME TAX PAYABLE. If his tax payable on all his net income, WITH HIS MILLION IN OCEAN FREIGHTS DEDUCTED ALONG WITH OTHER EXPENSES, amounted to $50,000, why, of course, he wouldn't owe the government anything. He would just deduct that five per cent again.

While Lasker was telling the country that he was going to sell these ships at give-away prices, and lend all this money to operators at two per cent interest, to enable American operators to compete in rates and service with foreign shipowners, Lasker was, under pressure, admitting to a joint Senate-House committee that this clause was put in for the additional purpose of enabling the American shipper to *pay a little higher rate to American ships than he would have to pay to foreign ships for the same service.*

Subsidy Not for Freighters

NOW throughout all this discussion it must be remembered that Lasker's subsidy bill didn't do much in the way of direct subsidy payments for the freighter —which carries the farmer's products to the foreign markets. That phase of the bill gave the greatest benefit to the passenger and cargo-passenger boats, which are owned by big corporations—something like the one planned by the Fleischhacker boys, according to Lasker, and the one planned by the Shipping Board officials like J. B. Smull, W. J. Love, two $35,000 a year advisers, Homer Ferguson, E. J. McCormack and others, who were to buy in the *Leviathan* and build two 1,000-foot liners. While the slow and lowly freighter was beating its way over the seas with the farmers' products it would be getting a few thousand a year out of the subsidies. But the proud liners, carrying express, mails, and wealthy passengers who want palatial surroundings when they sail the seas—these boats would have been drawing a million or more each in direct subsidies.

But perhaps, Mr. Lasker ought not to be blamed—since he was depending on experts like Smull and Love —who were preparing, 'tis said, to kick up a cloud of dust in their exit from Shipping Board service as soon as the subsidy bill passed, and were going into the ship owning and operating business. And, too, Lasker was depending for his advice on the private ship operators —who of course were striving their best to get the subsidy bill through Congress because it would do so much for the farmer.

The Faith of the Fathers:

"Beware of Bureaucracy" Their Warning Cry

By JOHN BASIL BARNHILL

You can trust the people but you cannot trust the politicians.—*Patrick Henry.*

Other liberties are held under government but the liberty of opinion keeps governments themselves in due subjection to their duties.—*Lord Erskine.*

The love of power and the love of liberty are in eternal antagonism. Where there is least liberty the passion for power is the most ardent and unscrupulous. —*John Stuart Mill.*

Like almost all his contemporaries La Rochefoucauld saw in politics little more than a chessboard where the people at large were but pawns, and the glory and profit were reserved to the nobility.—*Encyclopedia Britannica.*

Were we directed from Washington when to sow and when to reap, we should soon want bread.—*Jefferson.*

Just as a man, at a certain age, passes into second childhood, so all nations, during their period of decadence, manifest a return to bureaucratic forms.—*Wordsworth Donisthorpe.*

Progress necessarily depends on moral factors, moral leadership, moral responsibility. But the first thing the government does on assuming a new function is to declare its irresponsibility. The citizen cannot enter its courts and sue for justice.—*Yves Guyot.*

The people who, in their corporate capacity, abolish the natural relation between merits and benefits, will presently be abolished themselves.—*Herbert Spencer.*

Corruption is the soul of centralization.

It would make a scoundrel out of a saint to give him unlimited power in spending other people's money.

In the last six years government has become a job, like great charities.—*Emerson,* writing in 1834.

I do verily believe that a single consolidated government would become the most corrupt government on the earth.—*Jefferson.*

Bureaucracies always try to suppress agitation but without agitation society would become hopelessly stagnant and corrupt.—*Wendell Phillips.*

Government is always stupid, slow, wasteful, corrupt. With its essential limitations it is qualified to be merely a watchdog; we are lucky if it is merely an honest one.—*Herbert Spencer.*

With us government has come to be a trade and is managed solely on commercial principles. A man plunges into politics to make his fortune and only cares that the world should last his day.—*Emerson,* writing in 1835.

Government at its best is a necessary evil; at its worst an intolerable one.—*Thomas Paine.*

No history is copious enough to record the evils that have ensued upon the denial of liberty.—*Greville McDonald.*

Under a complete bureaucracy no means could be found by which public resistance to official aggression could be organized.—*Max Hirsch.*

It is a universal tradition, founded on universal experience, that man is corrupted by power.—*John Stuart Mill.*

Where everything is done through the bureaucracy, nothing to which the bureaucracy is adverse can be done at all.—*John Stuart Mill.*

The crimes of history may be summed up in the words—abuse of power. The teaching of history is that power is always abused.—*John Stuart Blackie.*

The gravest and most instructive fact revealed to us by this grand spectacle of civilization, is the danger, the insurmountable evil, of absolute power in any form. —*Guizot.*

Under a bureaucracy, "the individual withers and the state is more and more."

What has destroyed the liberty and the rights of man in every government which has existed under the sun? The concentrating all cares and powers into one body, no matter whether of the autocrats of Russia or France or of the aristocrats of the Venetian Senate.—*Jefferson.*

The Deadly Logic of Bureaucracy: What is everybody's business is nobody's business; what is everybody's profit is nobody's profit; what is everybody's loss is nobody's loss; therefore, if the government squanders billions (of your money) no one has lost anything.

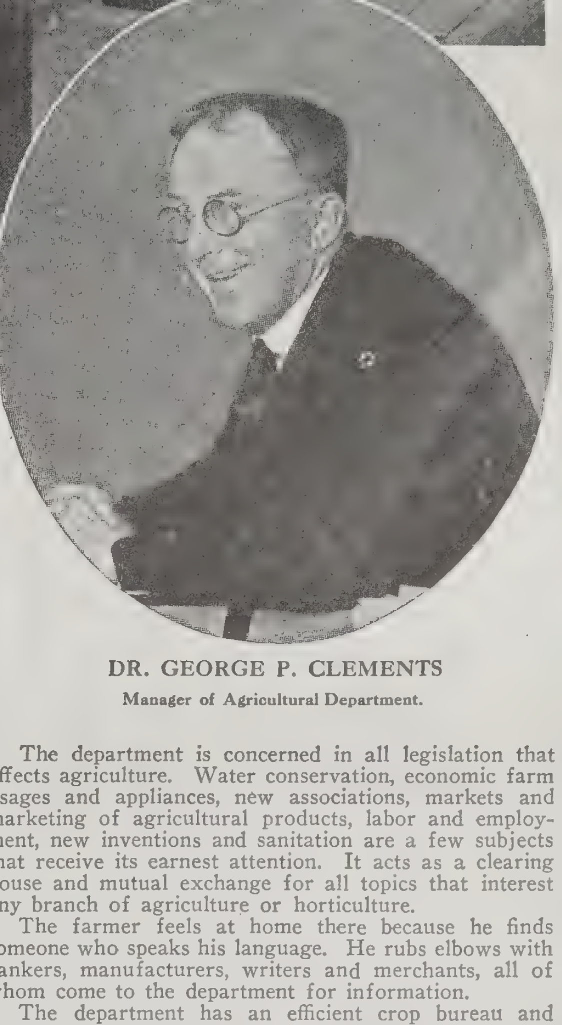
Why should the government spend money "like a drunken sailor"? Why should it not do so? It is only spending other people's money. These staggering losses, impersonal and imperceptible at the moment, are not felt till mounting taxes and a depreciated dollar bring home to the people that thousands of "lame ducks" filling utterly useless "soft government jobs" cannot have their cake without eating the people's cake.

Protecting the Tenderfoot in Southern California

No Need to Succumb to Wiles of Land Sharper

By JOHN B. WALLACE

Left to right—Howard A. Miller, assistant to Dr. Clements; J. B. Lillard, State Supervisor of Agricultural Instruction, Sacramento, California; Margaret M. Fahs, stenographer; E. J. Brickell, commercial drainage work; F. F. Foster, Field Manager Southern California Associated Concrete Pipe Manufacturers.



DR. GEORGE P. CLEMENTS

Manager of Agricultural Department.

ATTRACTED by Southern California's mild climate and profusion of fruits, flowers and garden products, visitors pour into this Italy of America at all seasons. Some are tourists who seek to escape the rigors of winter, but many succumb to the seductive climate and become permanent residents. The middle western states contribute the majority of those who remain. Many are farmers who accumulated a little competence. They are in the prime of life and look about for an orchard, orange grove or small farm. Another class has dwelt in the city and dreams of a home in the country.

Without proper guidance these settlers are in danger of losing all. There are hordes of unscrupulous real estate agents who prey upon the unsophisticated. This is not a wholesale indictment of the real estate dealers of Southern California; without question many are honest and attempt to locate their clients satisfactorily. But unfortunately these men are overshadowed by the flamboyant advertising methods of their untrustworthy rivals. With these latter, the commission they derive from a sale is the outstanding feature and to obtain that commission their code of ethics embraces anything short of strong-arming their customers.

Los Angeles is the Mecca of these gentry. The visitor cannot walk a block without being besieged by a dozen men or women offering him the attractive bait of free excursions, barbecues, automobile trips, and so forth.

In every niche, corner and doorway these agents lurk, to spring upon a likely prospect. These suburban additions, orange groves, walnut groves, truck gardens, which they sell are often legitimate investments. In suburban property, especially with a city growing like Los Angeles, there is not much chance for an investor to invest unwisely if he buys at the right price and in a decent location. But, ignorant of values and with no disinterested person to advise him, he is apt to be stampeded into unwise purchases. The agent talks fast and furiously, he points out all the advantages but is careful not to disclose the drawbacks, and his victim, under the spell of the beautiful climate, the automobile ride and dinner he has enjoyed at the expense of his host, throws caution to the winds. Then there is a certain mass psychology also brought into play. By taking out a crowd and inducing one person to buy, agents at times stampede the others. This may be done by employing a "capper"—a person working for the agent who ostensibly purchases a lot and then loudly boasts of his bargain.

It is in orchard and agricultural property that the greatest losses are suffered. The farmer may have been successful on the prairies of Kansas, Nebraska and Iowa. He may have been a shrewd judge of farm values on his native heath, but in California the climate, soil conditions, rainfall and growing seasons are so different that the eastern and middle western agriculturist is working under a distinct handicap. And if the experienced farmer is at a disadvantage, the city dweller, whose knowledge of agriculture is purely theoretical, is doubly so.

Business men of Los Angeles long had recognized these conditions, but it remained for Frank Wiggins, secretary of the Los Angeles Chamber of Commerce, to devise a remedy. The war gave him the opportunity to try his plan and there followed the establishment of an agriculture department in the Chamber of Commerce. To head this department he selected Dr. George P. Clements. Dr. Clements for years was a practicing physician with a hobby for agricultural experimentation. Finally he abandoned his practice to become an agricultural expert. For twenty years he studied agriculture and horticulture in Southern California. He also studied economics, reclamation and water conservation.

The department's purpose is to "Find the new citizen what he wants where he wants it." County and state lines have gone down. The department will locate a stranger just as cheerfully in Imperial Valley as it will in Los Angeles County, place him willingly in Nevada or Arizona if he prefers those states to California. It is good business, too, because Los Angeles draws trade from its neighboring states.

Not only is the stranger given advice as to soil, water, and cultural methods in the district in which he desires to locate, but the property which he may have in mind is appraised for him at no cost except the transportation of the appraiser.

The visitor's contemplated purchase may be desirable for one investor but entirely unsuited to the particular buyer. As an instance: the land desired may require more money to develop properly than the inquirer possesses. It may not have a good water right, or the water right that goes with the property may not be sufficient for the needs of the crop. It may be an orange grove that has not been properly fertilized or fumigated. There are many possible disadvantages which the inexperienced buyer might overlook and of which the real estate agent or owner will not tell him. The facts are pointed out to him by the expert from the Chamber of Commerce. He buys with his eyes open.

In a year the department appraised three million dollars' worth of property and passed on thirty per cent of it. That which was rejected was not necessarily bad, but it was unsuited to the needs of the purchaser.

The department answers by mail more than 30,000 inquiries a year, these inquiries coming from all parts of the world. The humblest inquirer is given the same courtesy and attention as a wealthy applicant. No question is considered too trivial to answer.

The department works with the governing, educational and producing bodies of the state, is in harmony and close touch with the state department of agriculture, the state college of agriculture, the agricultural extension service, and the many producing associations, all of which find representation upon the agriculture and horticulture committee of the Los Angeles Chamber of Commerce of which the agricultural director is a member and acting secretary. Dr. Clements is also a director of the Los Angeles Farm Bureau.

The department also acts as a bridge between agriculture and commerce. It has worked toward promoting closer relations, has ironed out many misunderstandings and encouraged friendliness and confidence.

The department is concerned in all legislation that affects agriculture. Water conservation, economic farm usages and appliances, new associations, markets and marketing of agricultural products, labor and employment, new inventions and sanitation are a few subjects that receive its earnest attention. It acts as a clearing house and mutual exchange for all topics that interest any branch of agriculture or horticulture.

The farmer feels at home there because he finds someone who speaks his language. He rubs elbows with bankers, manufacturers, writers and merchants, all of whom come to the department for information.

The department has an efficient crop bureau and statistics are furnished to the individual inquirer as well as to marketing associations.

The Los Angeles Chamber of Commerce is the largest organization of its kind in the country and no little of its success is due to the establishment of this unique department which could well be copied to advantage by other commercial bodies.

Hoover War Library to Hold Historic Papers

Concluded from page 3

rare "Documents of the Moment," issued in pamphlet form in about one hundred numbers in Poland during the period of German occupation, came through a friend of Mr. Hoover to the library and was a gift of the Polish government.

Posters, flaming with war demands of fight and conservation, continue to arrive from unexpected sources. On the whole, no effort has been made to secure any considerable number of large posters since they rapidly fall to pieces with handling, and to take the place of these, the collection is acquiring poster photograph albums, published both here and abroad. Newspaper files have been relied upon more than posters to relate the story of progress and the turning of national minds from peace-time pursuits to the business of fighting. It has been, and still is, the general plan to secure two or three newspaper files from each country, selecting these as nearly as possible on the basis of obtaining the leading paper supporting the government, and the leading anti-government daily.

From all parts of the world have pamphlets and full libraries been coming ever since the Armistice was signed. Secret material from gentlemen who exacted a promise that their manuscripts would not be opened for periods ranging between five and twenty-five years continues to find its way into the archives of the library. Secret documents and manuscripts dealing with the history of the Baltic states before and after the Armistice, including copies of the famous Prince Bermont-Awaloff manuscripts, probably form the one group about which most interest attaches, yet they will not be unlocked and unsealed until after 1945. Some there are who would fear for their lives were these personal memoirs published! And there are several manuscripts from the Near East, gathered mainly by relief workers, with a few sent in by Armenians, Turks and Syrians.

The "Miliukov Collection" deserves special mention in passing. Paul Nicholaivitch Miliukov was probably the most distinguished professor of the University of Moscow. He was Liberal leader of the Duma during the last two years of Nicholas II and later minister of foreign affairs in the provisional government of Prince Lvoff, after the overthrow of the monarchy. In 1914, Professor Miliukov had sent his large, private collection, consisting chiefly of source material, into Finland. In 1920, he offered the library to Stanford University through Professor F. A. Golder, member of the Washington State College history faculty and long friend to the Russian, if Professor Golder could find the library. After some ramblings through Finland, Professor Golder found a farmer in whose hands the library had been placed for safe-keeping, and shortly afterward, the collection, in thirty-four packing cases, was sent to the Hoover War Library. Most of this material consists of documents and manuscripts gathered for the study of Russian institutions and history.

While the great mass of stuff the collectors have brought together in their one long room in the Stanford general library has been more or less highly specialized, they also have much general literature, privately published in the leading countries of the world. This, with the rest of their documents, letters and what not, will shed much light for students on little-known causes of international happenings of the last decade.

The completed portion of the Washington Cathedral. The building occupies one of the most beautiful locations in Washington, towering high over the city.

Ghosts of Nation's Famed Haunt Historic Churches of Washington

Old Religious Edifices of Capital Conjure Memories

By CARSON C. HATHAWAY

BECAUSE we are all hero worshipers, everything associated with a famous man, from his signature to his personal attire, becomes an object of interest. To the majority of his countrymen, everything he touches is surrounded by a golden halo, as if it had mysteriously acquired a measure of his greatness. So it is inevitable that the old churches of Washington, D. C., should conjure up memories of many famous Americans. The ghosts of generals, Presidents, diplomats, are there—statesmen who carved niches for themselves in the Halls of Fame. Great men have spiritual qualities and the leaders of America have always turned to the temples of God for inspiration.

Not far from the city of Washington, in Alexandria, Virginia, is old Christ Church. It is known as George Washington's church for to its services came the Father of his Country, drawn in a coach and four, with the charming Martha at his side. The church was finished in 1773, a century and a half ago. Washington bought the first pew, paying thirty-six pounds and ten shillings, the highest price paid, in keeping with his position as one of the richest of the landowners. The pew is carefully preserved and Sunday visitors are allowed to worship there, provided they obey the injunction in the entrance of the building:

VISITORS ON SUNDAY WHO DO NOT INTEND TO REMAIN UNTIL THE SERVICES ARE ENDED WILL BE KIND ENOUGH NOT TO ENTER THE CHURCH.

Here also is the family pew of Robert E. Lee, the beloved general of the Confederacy. Lee lived in Alexandria, attended Sunday school in Christ Church in his boyhood days and is said to have worshiped there on the last Sunday before he took command of the Southern army.

The land for the church was given by John Alexander, for whose family the city was named. The church was built of brick brought from England and was designed by James Wren, a descendant of Sir Christopher Wren, architect of St. Paul's Cathedral in London. The pews are of the type familiar in colonial pictures. It is said that when the church was built, one member whose wife was deaf was allowed to install a special seat beside the pulpit.

In the old churchyard are buried some of the early settlers of Virginia. Over their graves are time-worn monuments with many quaint inscriptions.

The atmosphere of the church and its acre of ground, "God's acre," is filled with a quiet peacefulness and an indefinable charm. Surrounded by majestic trees shading the homes of the dead, the church must have had a profound influence upon its members, the two most famous of whom were both *Virginia gentlemen* in the highest sense of that phrase.

In the city of Washington itself, within a stone's throw of the White House, is historic St. John's, an Episcopal church designed in 1816 by Benjamin H. Latrobe, the architect who restored the White House after the British burned it in 1814. The architect declined any pay for his work. That was almost enough in itself to make both him and the church famous. Tradition says that he was offered a free pew but he requested something that might be handed down to his children, so he was presented with a piece of plate.

St. John's has well been called "the church of the Presidents." Madison accepted the first pew there in 1816, and since that time most of the Presidents have at one time or another worshiped there. Monroe, Andrew Jackson, Van Buren and John Quincy Adams were among the early communicants. It is said that on Sundays Adams sat on the front row with his granddaughter and on Mondays required her to repeat to him as much of the sermon as possible. He mentions in his biography that he did not approve of all of the statements of the rector, notably when he publicly criticized the selection of a Unitarian minister as chaplain of the House of Representatives.

For the brief period between his inauguration and his death, William Henry Harrison attended St. John's. His Sunday costume was completed by a pair of long white gloves, decorated with black and green log cabins reminiscent of campaign days when "Tippecanoe and Tyler, too" were running for office. After Harrison's death, Tyler took his place in the President's pew.

One convenience placed in the church was a pulpit running in grooves on the floor so that it could be pushed back to the wall. One Sunday, an eminent bishop presided. In the midst of a fiery discourse the pulpit suddenly began to roll away, carrying with it the startled divine. Faster and faster it went, until it reached the wall. It is not often that a speaker is so carried away by the force of his remarks.

Other distinguished visitors were Zachary Taylor, Fillmore, Calhoun and President Arthur. The latter placed a stained glass window in the church in memory of his wife.

At the edge of Washington is famous old St. Paul's church, better known as Rock Creek Church. It is one of the oldest in America. The land was provided in 1712 by John Bradford, who gave one hundred acres. In 1726 the Maryland assembly provided that twenty thousand pounds of tobacco might be levied on the taxable persons in the parish to build the church. In 1727 a vestryman was authorized to send for a Bible and two prayer books which were to be paid for in tobacco. One prayer book was for the minister and the other for the clerk who read the responses in behalf of the congregation.

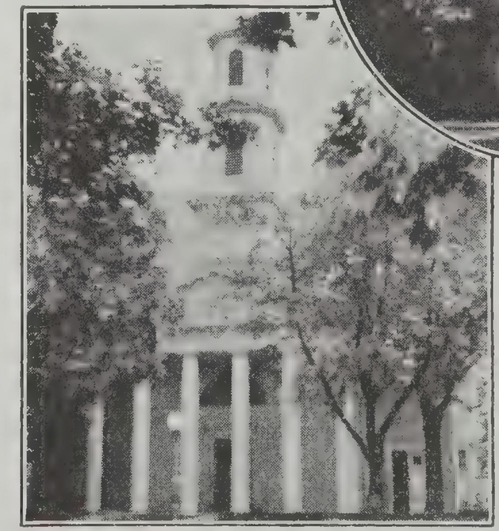
In 1771, ninety-six thousand pounds of tobacco was levied on the taxable parishioners to erect a new church. The church owned its own tobacco warehouse. So prevalent did the raising of tobacco become, however, that the production had to be restricted and a vestryman was appointed to count the tobacco hills and see that no member raised too much.

The church is bordered by an old cemetery in which stands the famous statue by Saint-Gaudens called "The Peace of God." This monument is over the graves of Henry Adams and his wife and is one of the most famous pieces of sculpture in America.

Abraham Lincoln attended the New York Avenue Presbyterian Church. The pastor, Reverend Mr. Gurley, was his favorite speaker. It is said that Lincoln found comfort in the trying days of the Civil War in stealing away to the church and, unseen by the congregation, listening to the sermon from an anteroom. Gurley attended Lincoln after the assassination and delivered the eulogy in the White House.

The church was established in 1803 at a time when "huntsmen shot quail under the shadow of the Capitol and the best land was sold at fourteen cents a foot. President Jefferson was superintending the planting of Lombardy poplars along Pennsylvania Avenue, which in the spring was a series of impassable beds of red clay."

Lincoln is said to have prevented the church from being turned into a hospital during the Civil War, granting an intercession by its pastor in its behalf. Before Willie Lincoln died, he asked that his little bank, filled with coins, be turned over to the New York Avenue Sunday School to be used for the missionaries. Lincoln's pew is still an object of interest and inspiration, and is open to worshipers at the Sunday services.



Historic St. John's Episcopal Church, known as the Church of the Presidents. It is one block from the White House.

In early times, there was little distinction made between the white and the colored population, so far as church attendance was concerned. In Trinity church, the first marriage recorded, under date of January 1, 1795, was that of David Thomas to Phyllis, a Negro slave, the property of Elizabeth Coyle. Marriages and baptisms of slaves are frequently mentioned in the records. Only in 1819 were the blacks separated from the whites in the First Presbyterian Church. But as the Civil War approached, not only was there no intermingling, but the question of slavery often threatened to disrupt the congregations.

A Unitarian church had a bell made in a Massachusetts foundry established by Paul Revere. When John Brown was executed, some members tolled the bell. It was thereupon denounced as an "abolition bell." No longer did its voice sound so beautiful to those who sympathized with the slave owners.

Political differences also brought trouble to some of the pastors. During the administration of Andrew Jackson occurred the famous Peggy O'Neal scandal. She had formerly been the wife of a ship's officer who had cut his throat and jumped into the Mediterranean Sea because, so the gossips said, of his wife's escapades with John H. Eaton. When Eaton was appointed Secretary of War (he had in the meantime married Peggy) a bitter social feud arose. Jackson staunchly defended the war secretary and his wife. The President had a stormy interview with his pastor of the New York Avenue Church over the question and finally withdrew in hot anger from the congregation.

In early days, both the church buildings and the pastors were frequently chosen for their availability. Often the members met in private houses. One church had rooms over the public baths. The First Presbyterian Church met successively in a carpenter shop, a farmhouse, a Masonic lodge room, and in a room used by the Supreme Court in the basement of the Capitol.

The churches were far from comfortable. On cold days, the ladies used foot warmers filled with live coals. Tallow candles lighted the buildings and were replaced as often as necessary by the sexton during the course of a meeting.

As the churches were usually pressed for funds (modern churches not having a monopoly on this failing), the pastors were often government clerks. The pastor of the First Presbyterian Church, a distinguished gentleman who served his people for over half a century, was a clerk in the Treasury Department.

One of the greatest honors which may come to a Washington pastor is his selection as chaplain of the national House of Representatives or the Senate. His only duty is to deliver the invocation each day. One of the qualifications for an appointee is the ability to deliver a short prayer. When the Capitol was removed to Washington from Philadelphia there was a spirited contest for these places. A Baptist, three Presbyterians, an Episcopalian, a Millennialist and a Methodist were candidates. The Methodist and

Christ Church, Alexandria, Virginia, commonly known as George Washington's Church. Christopher Wren tower.

the Episcopalian finally won. Edward Everett Hale, the distinguished Unitarian divine, was chaplain of the Senate from 1903 until his death in 1909. A blind man, the Reverend Mr. Couden, served as chaplain of the House for many years.

When Pierre Charles L'Enfant, the French soldier and engineer, made the plans for the city under the direction of Washington, it was provided that a church should be erected for national purposes. The building was to be used for public prayers and thanksgiving and for funeral orations over the nation's heroic dead. A site was provided but it was not used for a church. Instead, the Patent Office was erected there. Inventive genius and commercialism triumphed over religious sentiment. The result is that the United States is one of the few important countries whose capital city does not contain a great religious edifice. There are many churches, but none whose architecture compares with some of the cathedrals of the Old World.

To meet this deficiency, a wonderful cathedral is rising on a hilltop to the northwest of Washington. It is popularly known as the Washington Cathedral. In years to come it will be one of the famous shrines of the world. Its story reads like a romance.

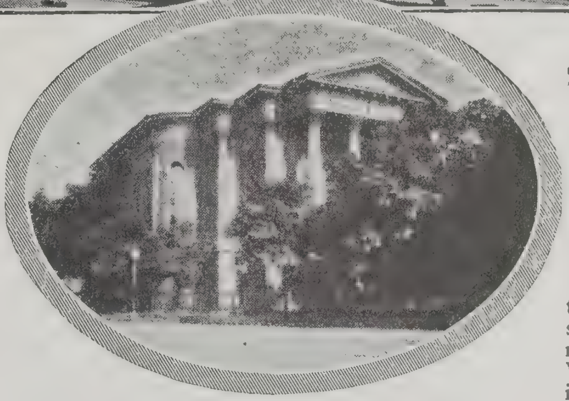
It stands on a majestic elevation known as Alban Hill. Before the place marched Braddock's troops on their way to tragedy. Later, one of Washington's friends, Joseph Nourse, the first registrar of the Treasury, lived there.

"Some day," he said, "a great church must stand on this spot."

Years passed and Nourse died, his dream unrealized. His granddaughter, an invalid, sewed for her friends and carefully saved the money. What she planned to do with it no one knew. Her secret was not discovered until after her death. Then there was found among her belongings a box bearing the words, "For a free church on Alban Hill." The box contained forty gold dollars. Stirred by her devotion, a little band gathered together and built a church with her contribution as a beginning. The congregation continued to grow and presently the plans for a cathedral began to crystallize. It was to be the most impressive structure of its kind in America. Already a considerable portion has been built and the chapel and grounds are valued at four million dollars. The completed cathedral will cost more than ten million dollars.

It will be of the purest Gothic architecture. Five hundred feet long and one hundred and thirty-five feet wide, with its central tower rising over six hundred feet above the city, it will easily overtop every other edifice in the capital, even the mighty Washington Monument. It will be a building of sublime majesty. Thus will the dream of Joseph Nourse be realized.

The Washington Cathedral, now in process of erection. It will cost over $10,000,000 and will be the finest structure of its kind in America.



Above—Interior Christ Church, Alexandria. Washington's pew where box hangs on the pillar. Below—The New York Avenue Presbyterian Church, the church of Abraham Lincoln.

No such edifice is complete if it does not contain historic objects from the great religious shrines. The Washington Cathedral contains memorials from many of the cathedrals of the Old World and from other spots of religious interest. The foundation stone was brought from Bethlehem, the baptismal font from the Jordan River, the pulpit from Canterbury Cathedral. The altar was cut from the quarries of Solomon, not far from Calvary. Spanish War cannon furnished the metal for an open-air pulpit before which may be gathered more than twenty-five thousand persons.

Among the striking objects on the grounds is a Glastonbury thorn tree. Tradition relates that Joseph of Arimathea went to Britain and at Glastonbury placed his staff in the earth as a symbol that he would begin his evangelical work there. The staff took root. Later, it was cut down by the Puritans but it came up again. The little tree in Washington was taken from the famous old tree in England. It blooms twice a year. There is a pretty custom handed down by tradition of presenting distinguished visitors with a bloom in a tiny silver box.

Nations do not erect cathedrals until they have reached a contemplative mood. America has been too busy developing natural resources to stop to think. So we have no Sir Christopher Wren—no St. Paul's Cathedral. But with the completion of the new structure in its ideal location in Washington a new inspiration will be given to the whole nation. What Rheims Cathedral has meant to France, and it has been called the soul of France, what Westminster Abbey has meant to England, the Washington Cathedral will come to mean to America.

It will be a fitting climax to a century and a half of religious development in the capital city.

When J. M. Barrie Spoke to the "Red Gowns"

Concluded from page 2

tolling their fallen hero son. Proud of it as they were, they preferred to its laudatory terms their own memories of the real boy whose very peccadillos were matter for loving recollection. With what a roll of delighted cheering did we greet Barrie's suggestion that the part of the old lady in that play might be taken by a distinguished alumna of the university then present; and we loved him for the grace and very sweetness of his introduction of her—"The loveliest of all young actresses, the dearest of all old ones; it seems only yesterday that all the men of imagination proposed to their beloved in some such frenzied words as these, 'As I can't get Miss Terry, may I have you?'"

And hard upon our cheering, swinging us round abruptly once again to a confronting of duty, came the great Call to the Youth of All the World. That was eighteen months ago. Has Youth in all lands, or in any land, pertinently questioned the acts of those who would clutter its path with the ashes of ancient enmities?

What of the League of Youth? That the message which fell upon the stirred hearts of those who heard it delivered has been fruitless, is unthinkable. Listen to it, as we heard it then:

> *"How to make a practical advance? The League of Nations is a very fine thing, but it cannot save you, because it will be run by us, your betters. Beware your betters bringing presents! What is wanted is something run by yourselves. You have more in common with the youth of other lands than Youth and Age can ever have with each other. The hostile countries sent out many a son very like ours, from the same sort of homes, the same sort of universities, who had as little to do as our youth had with the origin of the great adventure. Can we doubt that many of these on both sides who have gone over and were once opponents are now friends? You ought to have a League of Youth of All Countries as your beginning, ready to say to all governments, 'We will fight each other, only when we are sure of the necessity.' Are you equal to your job, you young men? If not, I call upon the red-gowned women to lead the way. I sound to myself as if I were advocating a rebellion, though I am really asking for a larger friendship."*

The speaker stepped to the front of the platform, edging clear of the reading paraphernalia as though he could not bear that anything should bar him in any way from his hearers. The deliverer of the Call to Youth makes little use of gesture. Gesture he has used, indeed—with what an inimitable touch did we envisage McConnachie declare himself superior to "linage" considerations in the days of his freelance journalism! Intimate appeal, searching sincerity, charge the clear voice as this new and greater Barrie—Barrie the man, the lover of the Youth of All the World, striving to help it—urges Youth to take its due share in all that concerns it. Sometimes it is in the fun-flash that lights the speaker's eyes that we are notified of McConnachie's immediate proximity; occasionally, too, the flap of that one wing may be faintly heard from behind a cloud seemingly somber. It is McConnachie's function, throughout, to fan into grateful coolness the places which the speaker in his burning enthusiasm has seared in passing; and ever he is instant to the task.

The dull note of personal pain is heard as he takes from the almost-unnoticed papers in his hand a few "little filmy sheets"—the letter retrieved from that far-off tent in the wastes of ice, written by Captain Scott to Barrie, his friend, in farewell.

I would that you could hear the thunderous "NO!" with which we greet his announcement that this, his first public appearance, will be his last. And there are tears in the eyes of many wearers of the red gown as he continues— "I never would or could have made it except to a gathering of Scottish students. If I have concealed my emotions in addressing you, it is only the thrawn national way that deceives everybody except Scotsmen. I have not been as dull as I could have wished to be; but looking at your glowing faces, cheerfulness and hope would keep breaking through. Despite the imperfections of your betters, we leave you a great inheritance, for which others will one day call you to account."

See him now, his great task ended. The students in their hundreds are up on the seats, standing; the platform party, upstanding, too, is joining in the mighty roll of cheering that seems never-ending. They have as one risen in that glow of cheerfulness and hope, and their acknowledgment of the call to high courage and great duty rises echoing to heaven. And Barrie, the gentle, fleeting smile of McConnachie flitting over his face, has stepped back to his place. He surveys the scene, and his eyes are warm. The pallor of the fine face has increased, there is weariness in the resting figure; he looks tired, but . . . . so *glad!*

We poured from the Lord Rector's presence in our cheering hundreds; but the "thochtless de'ils" against whose emergence the wary grocer was wont to put up his shutters and lock away his wheelbarrows had had something to think over, that day. To what purpose they have been thinking since then may become more evident as they take their places in the affairs of the time. Doubtless they will remember, as I do, that while the subject of that great address was "Courage," its mightiest appeal lay in that Call to the Youth of All Countries to assert its right to shake itself free of "old, unhappy . . . . things" perpetuated in the selfishness and jealousies of "their betters," who wrap the young bodies in the sweetest of wrappings yet allow the young minds to suffer the taint of diseased rags of earlier, evil times.

Have British Failed the Jews in Palestine? And If Arabs Are Killed Off, What Then?

Zangwill's Criticism and Plea That "United States Opinion" Help Zionists to Their National Home

By a British Journalist

THE Jews are dissatisfied with the British administration of Palestine. The land which, under the British mandate, was to become the national home of the Jews, is apparently not taking on with satisfactory rapidity the complexion which zealous Zionists desire; and, if the published reports be accurate, Israel Zangwill has been putting before the American Jewish Congress some points on the whole matter, from which we gather that in the opinion of the Zionists someone has failed in Palestine. They appear to be quite decided as to who has failed. We learn that the British have not been interpreting their mandate as the Zionists would like; that, rather than making of Palestine a home for the Jews, the British are developing the country for the Arabs; and we are informed that the mandate specifically laid upon Britain the duty of developing Palestine as the Jewish national home, or quitting. Zionist opinion is stated to be that it is useless to attempt to make a fixed home for the Jewish nation "before the guaranties of that fixed home have been absolutely secured."

Zangwill's Cheerless View

MR. ZANGWILL, if reports have done him justice, seems to have been not too cheerful as to prospects in Palestine, when he arrived from England, and his assertion that "the Jews must forego their political hopes regarding Palestine rather than throw a match into such a powder factory as the world has now become" must, if made in that form, have come with a shock to the American Jewish Congress. The Congress is said to have disavowed that view by solemn resolution. Later we have Mr. Zangwill reported as attacking Britain's administration in Palestine, describing Sir Herbert Samuel, a Jew appointed by the British as head of affairs there, as too weak to carry out the mandate, and as maintaining that

> A resolution by the American Jewish Congress, insisting that the British mandate over Palestine be carried out, would do more toward making the Jewish national home a fact than any other possible step, "for the reason that England respects United States opinion. I am willing," Mr. Zangwill is reported to have added, "to meet a committee and draw up the resolution I suggest, in order to impress the British Government."

Are we here presented with a view of that well-known Zionist, arriving from Europe burdened with full knowledge of the gloomy facts, responsibilities and difficulties of the Palestine situation, telling his people "that they must forego their political hopes regarding Palestine rather than throw a match into such a powder factory as the world has become," and then this same Mr. Zangwill, his assertion emphatically disavowed by enthusiastic Zionists on this side, responding to his environment, urging action, and offering to show how action may best be taken, by the use of "United States opinion"? What, then, of the match in the powder factory?

Have British Failed the Jews in Palestine?

PUBLIC opinion in America has been kept fairly well informed of the progress of events in Palestine since the Great War, and Americans generally will be interested in an attempt to discover just wherein someone has failed in Palestine, and to what end the use of "United States opinion, which England respects," is to be directed. The interpretation given by the British to their mandate, most unsatisfactory as that interpretation appears to be to the Jews, is revealed in the lines upon which the administration of the country has developed. From the outset, there was general recognition in America that the British job in Palestine bristled with difficulties. It was not an unoccupied land that the mandatories took over. There had not been a clean sweep of the territory from end to end, to make of the country a place to be approved of the Zionist. It was a territory with a history brimful of eruptive matter; from the land the administration of the Turk had been swept, but a very large settled population, against whom there was no war, remained. The British apparently did not find in their mandate any authority to crush out that population, which contained important Moslem elements, to a large extent composed of Arab friends of the Allies. The Arabs who had assisted the Allies constituted in themselves a further difficulty. They very naturally desired to see some results from their part in the fighting. Accordingly, while respecting the rights of the non-Jewish people to whom Palestine was home, and holding in check his victorious Arab friends, the Britisher had to set about the fulfillment of the aim of making Palestine a national home for the Jews. How was it to be done? Whatever they read into or between the lines of the mandate, the Zionists have not yet set forth in satisfactory detail just what they expected the British to do. Were the British to impose by force upon the peaceful and unoffending people of Palestine the domination of Jews on the spot or to be imported? To make way for Jews expected from outside, were the important non-Jewish elements in Palestine's people to be forcibly uprooted from their place, deported, or otherwise disposed of? These questions are outlined by way of bringing again to American minds the salient features of the situation faced by the mandatories. There were other questions which caused the Britisher "furiously to think" before he had been long at the job. What was the Palestine which the Jews could claim as their national home? Was it the Canaan of the days of the Patriarchs, or as divided among the tribes? Would they at a pinch take in the dominions of David and Solomon, or stick to the kingdoms of Judah and Israel, or ask for the Palestine that was under Rome in the days of The Nazarene Who was slain, or be content with the Palestine which could be said to be under full governmental control of the Turk in 1914? It did not help the mandatory power in its difficulties that ever at its elbow stood its victorious friend, the Arab; and, behind the Arab, the whole Moslem world, on tiptoe.

How British Have Worked

THE course followed by the British in these circumstances is easily discernible in the lines which administration has taken, and the chief features of the policy, thus shown, may be enumerated very briefly: (1) Development of the country for the benefit of all the people in it or who may come to it—development in which full cognizance is taken of the fact that although the property has come under a new landlord, the tenants have not thereby been deprived of any of their rights; (2) Equality of treatment, civil and ecclesiastical, to all sections; (3) An open door to the Jews, every encouragement to them to come to the land of their fathers, protection for them against all enemies, a friendly support to them as a people who by their national vitality, their traditions, their enthusiasm in the founding of a national home, their racial persistence, and the powerful backing behind the movement they represent, must assuredly in due time become dominant in the land.

In giving to their mandate such an interpretation, the British have not satisfied the Jews. Wherein have they failed. What are the "guaranties of that fixed home" which, in the view of Zionists, must be "absolutely secured"? In short—What do the Jews want? To what intent are complaints that the British administration is "weak"? What is the full purpose of the charges that the Arabs are getting the benefit of the costly developments which the British are carrying out, rather than the Jews? The policy of development benefits the land as a whole, and if among others the Arabs in the country, who were there under the Turk, and remained there under the British, are receiving benefit rather than the Jews who won't come into it, whose is the failure? There has been grievous failure if the British were expected to drive out or kill off the inhabitants of Palestine to make room for the Jews. If it is weakness to decline to place a native people under the dominion of another people to be imported—if they will come—then the British have been weak. If the carrying out of their mandate involved the British in driving out by bullet and bayonet all non-Jewish people in Palestine, in setting up frontiers of a Jewish shrineland and holding these by force against all comers, then the British have failed to carry out their mandate.

Zionism on Trial

UNTIL the world knows just what, in the opinion of the Zionists, would be included in a satisfactory (to them) preparation of Palestine for the Jews as a national home, the world may not know just why Zionism, on its trial, has made such a poor showing. With Palestine thrown open to the Jews, have they flooded in? No; they have scarcely trickled. They represent a very grave disappointment, those few thousands of Jews who, under the Zionist impulse, have passed within the portals held open for them by the British. And the disappointment is as deep on the part of the British as in the ranks of the leading Zionists. The Zionist is not likely to admit, even to himself, that Zionism under the test has failed or can fail; consequently, he must explain otherwise the position as it now reveals itself to the world. In point of fact, an examination of the position seems to render pertinent the question—Have the Jews failed the British? Facing the duties of his mandate, a few years ago, the Britisher, recognizing the dangers of the path ahead of him, was frankly delighted that he could bring to the solution of the problem in Palestine such a powerful element as Jewish character plus the Zionist impulse. British faith in the Jew is the keynote of the policy followed in Palestine. There was no doubt whatever in the British mind that if the Zionist movement had the power claimed for it, if the Jews desired ardently in large numbers to return to Palestine and make of it their national home, the serious question of racial supremacy in that land would settle itself peacefully and inevitably within a few years, so powerful was Jewish nationality, so vital the Jew racially. It was all a question of numbers. The British—and the leading Zionists—expected such a rush as would soon place the Jews in Palestine in an indisputable and favored majority. The rush has not come. The British, without comment, are going ahead with their development work. They are astonished; they are disappointed; but it may not be correct to assume that Zionism has failed them altogether . . . . and, in any case, the work is to go on. There have been times of late, when the British would have appreciated greatly, we imagine, the help which a Jewish flood to Palestine would have afforded them. The sword of Islam has been flashing victoriously not far from that Palestine of the Zionist hopes. The Turks have defeated Greece in war and—some would add—the Allies in peace. Mohammedanism has surged with a sense of revival, and that surge has been not unfelt throughout Palestine, which the British are holding open in circumstances of increased difficulty for those thousands of Zionist enthusiasts who are staying away, and shouting from a distance—"Get us in, or get you out!" "We want guaranties of the absolute security of our national home first," the British are also told by the Zionists who find other lands than Palestine pretty comfortable, thank you. It is to be expected, then, that if the shouting continues, the Zionist will be asked to state openly if he really desires the British to smash the Moslem elements right out of Palestine. The American public, in view of the use of "United States opinion, which England respects," in furtherance of the Zionist aims, has an interest in the matter.

The "Powder Factory"

THE whole world knows what will follow any attempt either to crush the Moslems out of Palestine or to place them arbitrarily under any imported minority. It means war. No people knows that better than the responsible Zionists centered in London. *It may have been mere coincidence—the British are old at the game—but it is an interesting fact that Britain was careful to put leading Zionists into positions in which they would feel for themselves the full force of that Mohammedanism* which has become charged of late with the spirit of revival. Lord Reading, a Jew, felt its power as Viceroy of India. Sir Herbert Samuel, a Jew, was sent to take charge in Palestine. He has seen and experienced the conditions there. He knows what cannot be done. It was from a Zionist center enriched by the knowledge and experience of such men as these that there came the Israel Zangwill who said that "the Jews must forego their political hopes regarding Palestine rather than throw a match into such a powder factory as the world has become." Only one policy in Palestine would constitute the throwing of that match: the forcing out or subordination of the Moslems. Did the "Jewish political hopes regarding Palestine" embrace, after all, such a policy? Is that what they mean by "application of the mandate" and the "guaranties" of their national home?

Why Don't They Go to Zion?

THE British trusted to Zionism to "come into its own" if the door were only held open to it. That door is still wide open. Zionism is not crowding the portals. Can it possibly be, then, that there are Zionists who, sensing the failure of Zionism to place the Jews by peaceful means, by virtue of the inherent strength of the Zionist impulse, in the national home, do not scruple to urge a course that would involve war? Whether Zionism has been tested too soon, or too late, is of little moment to the Britisher who "put his money on the Jew," and whose view is simple. He sees no reason whatever for the Jews "foregoing their political hopes regarding Palestine as a national home." The land is open to them. If there is anything in Zionism they will come in sufficient numbers to make it their own in the only way permissible. If there is less in Zionism than he and other people thought, and the Jews won't come to the Palestine which he is developing for them, he can't help that, and all the worse for them, too, as the folks on the spot will become the more firmly rooted as the land is made more desirable. It is "up to" the Jews. To the contention that a resolution by the American Jewish Congress would do more than anything to make the Jewish National Home a fact, the unofficial Britisher will probably reply that there is one resolution which would do "even more than that"—a resolution by 100,000 real Jews, thorough Zionists, from anywhere at all, to pack their kits and come along at once and make Palestine their home. So far, he has not seen, in the Zionist movement, anything at all commensurate with the amount of trouble he has had over it.

International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

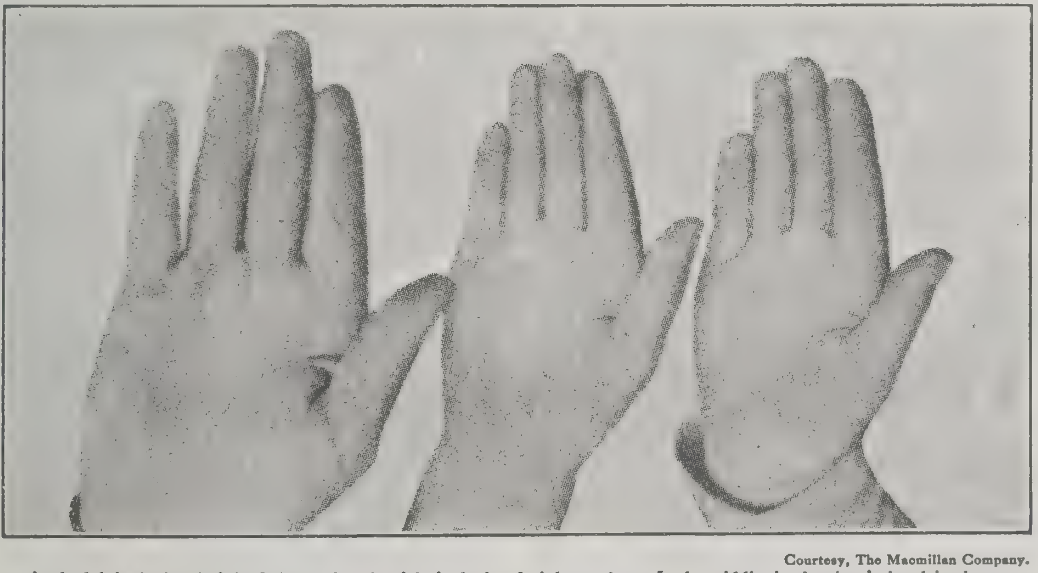
Protoplasm and Heredity

FROM a broad standpoint we may regard the entire universe as being alive. In a sense, the little atom throbs with life. Its constituent electrons whirl around in orbits in much the same manner that the earth and the other planets travel around the sun. The life of material particles, however, is limited to a definite mechanical routine. Changes in one material group occur automatically in response to changes in other groups, but the types of these changes can be predicted definitely if all the involved physical laws are known correctly. There is an ever-present dictum of *"must"* connected with the life of every purely material group. Wherever true life (in the usual sense of the word) is encountered, there we meet with the "unexpected" and for the word *"must"* we are constrained to substitute the word "may" as indicative of the presence of a certain amount of individual freedom.

A very excellent work entitled "Man—The Animal" has recently appeared from the pen of Dr. W. M. Smallwood, Professor of Comparative Anatomy in Syracuse University. We are in part indebted to this work for the facts here presented. Dr. Smallwood, in his discussion of the "biological unit" points out that the number of these units or cells in living organisms has no bearing on "their relative rank in the scale of life." The scientific name for "living substance" is *"protoplasm."* This substance invariably consists of two parts: (1) the *nucleus,* which is a central sac-like body; and (2) a larger surrounding substance which is called the *cytoplasm.* The starfish egg is of this structure, which is kept intact by an inclosing and protecting membrane.

In man we find cells or biological units of different types. Each typical cell is constructed in such a manner that it will best serve a definite purpose. In a bone cell, for example, the walls are comparatively very thick and the amount of the living protoplasmic mass is small. Other typical cells are found in such tissues as the glands, muscles, blood, nerves, and skin. The duty performed by the muscle cell consists in contracting and then expanding to an original normal length. The nerve cell performs the important duties of communication, synchronization, and control. They serve as bridges between various organic structures. The attenuated and very delicate fibers of the nerve cells connect one structure with another in much the same manner as the telephone wires in a city form a means of communication for the residents.

It is often claimed that one of the most important differences between the living and the non-living structure is that the living protoplasmic substance can actively respond to external agencies. Such external agencies are technically called *stimuli.* In our view of the world, non-living matter, however, is also capable of responding to changes in other matter groups. Therefore, the distinction can hardly be said to exist except in the degree of the freedom of the response. An important distinction, however, is that non-living substance can never produce from one of its units another that is its equivalent in all essential respects; whereas, living organic units can reproduce themselves. Other differences between living and non-living substances may readily be discerned when we study the laws which pertain to protoplasm.



Courtesy, The Macmillan Company.
At the left is the hand of the father and at the right is the hand of the mother. In the middle the daughter's hand is shown. The daughter inherited a short little finger from her mother. The comparatively long distance between the base of the thumb and the first finger in the father's hand was also inherited by the daughter.

The ten laws of living protoplasm may be stated as follows:

(1) Life cannot be generated except from living beings.

(2) Living cells of all kinds can be decomposed into chemical elements.

From this fact the materialistic scientist argues that life is nothing more than a special combination of chemical elements. Assuming this as a sound premise he believes that life can be manufactured in the chemical laboratory from the mere chemical elements. The first law of protoplasm flatly contradicts this conclusion. Life has never been produced from mere chemical combinations. What conclusion can safely be drawn from this apparent contradiction? The inevitable and easily found solution is that the *life essence* is liberated whenever the protoplasmic unit is decomposed into its chemical constituents. The real life unit eludes capture at the crucial moment of pure physical disintegration. This inference is borne out by the phenomenon of death in man. This greatest of all paradoxes substantiates immortality as a fact if we hold also, as we must, to the truth of the general law of conservation. If we suppose that the *life essence* is destroyed by the process of chemical disintegration, then we thereby deny the law of conservation which certainly must include that highest manifestation of being which is life. This view is no longer difficult to entertain because matter itself has been reduced to action centers, and the inorganic or so-called non-living world is merely a lowest degree of life functioning within a limited and predicatable field of action.

(3) A fragment of a living organism when removed from that structure may continue to function in its usual manner, but such a portion can never produce a replica of the original organism. A particular life type (man, animal or plant) does not reside in any one portion of the organic structure, but it pervades all its component parts.

(4) The size which a living body may attain is restricted within certain broadly defined upper and lower limits.

(5) The physical life period of an organism is limited and each type has a broadly defined limit.

(6) All living organisms are composed of one or more biological units called cells.

The problems of growth, disease, old age, and heredity are, therefore, problems of the life and functions of the cell units which constitute the living organism.

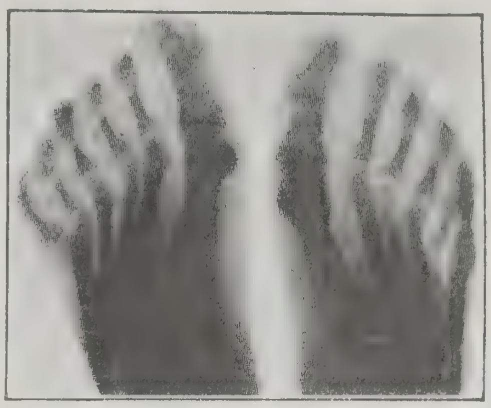
(7) A living organism grows by transforming materials unlike itself into substances which are of the same nature as its own.

(8) Protoplasm is capable of reacting to external stimuli, by appreciating its appropriateness for its own purposes, by transmitting a record of the effect of the stimulus to proper centers, and by transforming the effect of the stimulus into a suitable responsive movement.

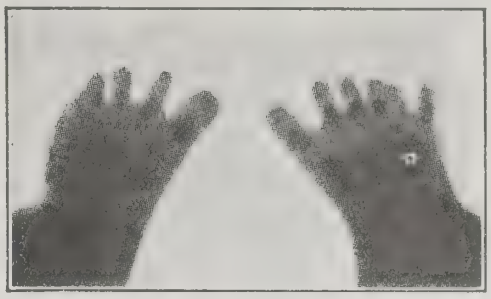
(9) Food is transformed chemically by the living organism into living protoplasm which furnishes energy to the structures as a result and in proportion to other subsequent changes in the protoplasmic substance which are accompanied by the production of waste products which are eliminated as undesirable to the organism.

(10) Dead organisms are disintegrated and converted into chemical substance.

Protoplasmic cells may be broadly divided into (1) *somatic cells* and (2) *germ* or *reproductive* cells. The *somatic cells* are engaged in the business of digestion, respiration, and responding to external stimuli. These cells compose the muscles, nerves and bones of man and animals; and the roots, branches and leaves of plants and trees. These cells are the mechanicians, engineers, and specialists of organized living systems. The *germ cells* are comparatively simple in structure. They do not take part in such routine work as the procuring and transforming of food, production of mechanical movements, and the building of tissues. The *germ cell* is inactive except when growing to replace liberated cells of their own type and during the cyclically recurring periods of reproduction. They are protected and nourished by the *somatic cells* and are safely housed in special organs. *They preserve their individuality and do not unite with other cells, whether of their own type or of the somatic variety.*



Courtesy, The Macmillan Company.
These X-ray photographs were taken by Dr. C. L. Potter, to ascertain if the daughter inherited the extra toes from her mother. Above—Feet of mother. Below—Feet of daughter. In the feet of the mother, the doubling of the toes is not the same on each foot. A comparison of the photographs of the daughter and mother shows that the daughter inherited the extra toe from her mother, but that the doubling in the mother's left is like the daughter's right foot and vice versa.



Courtesy, The Macmillan Company.
In the daughter's left foot, the bones of the fifth and sixth toes are doubled. In the right foot, however, this doubling extends only to the first two joints.

The nucleus of all cells contains a changing structure called the *chromatin* at one stage of its activity and *chromosomes* at another stage. The chromatin granules become altered in their appearance and take definite positions before a cell undergoes the process of division, but they remain the same individuals after the cell has broken down. Just before the process of *mitosis* by which the cells of animals and plants multiply, the chromatin granules, due to their modification, are known technically as *chromosomes.* The frog has fourteen, many snails have thirty-two, and for man the number is forty-eight. The *egg cell* and the *sperm cell* are, respectively, the reproductive cells of the female and the male. Although both types are composed of a nucleus and cytoplasmic substance, nevertheless, it must be admitted that they are not equivalent in many other respects.

Before fertilization takes place, both the egg and the sperm cells eliminate half of their chromosomes. Fertilization consists in the re-mating of the remaining egg and sperm chromosomes into a new single nucleus. Upon these chromosomes, therefore, rests the function of transmitting the parental or hereditary characteristics. The laws of heredity must therefore be sought in the nature of the parental chromosomes. In this fact is found the relation between protoplasm and heredity.

The sex of the offspring depends upon the number of sperm chromosomes transmitted and united with the mating egg chromosomes. A male child results from a union with twenty-three sperm chromosomes, whereas, a female child involves the presence of twenty-four sperm chromosomes. At the present time no definite facts are available by which this number can be predicted or its precise amount may be influenced.

Dr. Smallwood states that, "The fundamental question of human progress is intimately linked with this chance union of sperm and ovum. Even our limited knowledge of their behavior enables us to predict that there will always be a certain uniformity in the results. But within all this uniformity there exists sufficient possibilities for variation and for new combinations to explain the many differences which are common knowledge. This aspect of the law of biogenesis fixes the characteristics of man with steel-like bands from which he never escapes. He may rise above them or sink because of them. They may become his most priceless heritage or his greatest affliction. They cannot be ignored in this age and when understood solve much that is fundamental in his educational problems." Referring to "protoplasm" he states, "It is a part of the past influencing the activities of the present."

It is clear that the problem of heredity is intimately linked with the study of the chromosomes. With true scientific spirit, Dr. Smallwood admits that in considering the "how" of this question, "we pass into the realm of hypothesis."

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Senator Curtis, of Kansas, never takes an elevator if he has time to climb the stairs. He says climbing stairs is the best "reducer" ever tried. During the past summer he lost twenty-five pounds by this practice.

At the time of the recent eclipse of the sun, September 10, along the southern coast of California, there were on the State Highway 140 miles of automobiles, packed closely together. The occupants were journeying from Los Angeles to San Diego and Tia Juana, Mexico, to see the total eclipse. Traffic moved at six miles an hour and 1,000 arrests were made for cutting out of line and endangering others on the Torry Pines Grade, just out of San Diego. Gasoline stations were drained early in the day and fuel was sold for forty cents a gallon instead of fifteen cents.

In France, medical tests are necessary before a driver of a motor car is given a license.

Eskimos in the Canadian Northwest have asked the Anglican Church to send missionaries to offset the demoralizing influence of vicious whites.

The Bureau of Jewish Research reports that the United States now leads the world in Jewish population. New York has more than five times as many Jews as Vienna or Warsaw.

J. T. Krause, of San Jose, California, in 1910, planted two Concord grapevines in his yard. Today they cover an arbor of about 5,000 square feet, besides climbing over a tank house and tank, an elevation of thirty-five feet. The vines are planted thirty feet apart and have produced more than a ton of grapes for the last four years. They measure twenty and twenty-one inches in circumference at the base.

Dr. Charles H. Mayo, of Rochester, Minnesota, says, "It can almost be said with certainty that the average man can live five years longer than he does now. If he would present himself at every birthday for a thorough medical and dental inspection after he reaches the age of forty, he could maintain a state of health that would defy the incursions of disease bacteria. Dilations of the heart, distortion of different organs, cancers, tumors, and so on, can be nipped in the bud. There is too great a tendency to think that people past the age of sixty merely vegetate, waiting for death. Some way will be found to keep them vigorous."

Since the Prohibition law went into effect January 16, 1920, more than 90,000 cases have been terminated, of which there were 72 489 convictions. Fines totaling more than $12,367,660 have been assessed in criminal cases alone. Jail sentences for the past twenty-three months of national prohibition total more than 3,000 years.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

The extra $222,000,000 which the present sugar gouge is costing the American people is a sufficient sum with which to erect nearly 200 one-thousand-ton beet sugar factories with a producing capacity of 2,000,000 tons of sugar a year. Not only would this insure the American people against future sugar gouges, but under normal conditions of six-cent sugar and six-dollar beets the 17,000,000 tons of beets required to make this 2,000,000 tons of sugar would annually turn $102,000 000 into the pockets of American farmers instead of its going to the exploiters who never miss an opportunity of gouging the American people. Down on Wall Street are located the spacious offices of the little clique of sugar refiners which fixes the price that 115 millions of people must pay for a staple food article.

Rudolph Helferding, the new German Finance Minister, is a Jew. Dr. Streeseman, the German Chancellor, is married to a Jewess.

"Every project of reform has to pass through four stages. The first stage is that of 'Pooh, pooh!' The second—when vested interests begin to be attacked—is 'No, no!' The third, as the corporate ideal begins to gleam before the common eye, is, 'Well, well!' And the fourth and final stage is that of 'Yes, yes!'—to which most people add that they thought so all the time."—*Scottish paper.*

Skeletons of human beings buried for a period estimated to be between 7,000 and 10,000 years were recently uncovered at Point Magu, Ventura County, California, by a representative of the Smithsonian Institution of Washington, D. C.

A schooner tied to a dock at South Amboy, New Jersey, recently was being loaded with powder from railroad cars when a fire started on board ship. The flames spread to the powder and caused an explosion. The freight cars on the siding were set on fire and the glare of the flames attracted hundreds of motorists who headed in that direction. A dozen automobiles became jammed into a passageway beneath the railroad tracks. More freight cars of powder exploded, killing three of the trapped motorists and seriously injuring about twenty others. This is a result of the habit of running to fires.

An electric voting machine is used in the state legislature of Iowa. It has proved to be a time-saving device, enabling more legislation to be passed in a given time than formerly under the old system of voting.

A United States Navy airplane pilot, operating a Curtiss navy biplane, in preparation for the airplane races at St. Louis, recently established a new world's speed record of 245 miles an hour. The previous speed record was held by a lieutenant of the United States Marine Corps, with 238 miles an hour.

A Los Angeles judge allowed a husband, who was ill and unable to work, five dollars a week alimony from his wife's salary of a hundred and forty dollars a month, pending permanent disposition of the case.

Bookkeepers in India receive but $20 a month.

"Mike de Pike" Heitler, of Chicago, jaunty, dapper and well-dressed, says: "Sure, I sold a lot of whisky, but who sold it to me, and where are the guys that bought it? The law says they are as guilty as I am. I don't know to this day where the last lot came from, but the Federal Government knows and the owners of that distillery are still out in the free. It's as easy as eating a poached egg to stop it all. If the Federal Government would only put the screws on the places where it leaks out, and then check up on practically ninety per cent of the Federal agents who are getting their palms greased to the extent of millions a year, there would not be anything for the local police to do but pinch stickups and stop speeders. Hadn't I ought to know?"

The Australian tomato weevil is a new undesirable immigrant that has been discovered in the South. Agricultural experts fear it may become of great importance if measures for its suppression are not taken at once.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

CHRONICLER OF THE NEGLECTED TRUTH

Old South Meetinghouse: "Sanctuary of Freedom"

City Clamors Incessantly About It But Within Stillness Is Almost Uncanny

By MAY B. WHITING

THERE is a silence, a sort of awesome hush, about the Old South Meetinghouse. From the department stores on one side and the newspaper offices on the other, the city clamors incessantly about it, but in the shadow of its spire the noises seem less strident and voices take on a softer tone. Within its walls the stillness is almost uncanny, as if a little of the tenseness of its great moments remained vaguely to thrill the visitor. And yet Burke and Chatham, in the English Parliament, described a scene of turmoil by calling it "as hot as the Old South Church in Boston."

The Old South was organized because of a disagreement over the burning question of the hour—who was entitled to the rites of baptism. There was a tendency to a more liberal extension of the privilege, and when Madam Norton, widow of the pastor of First Church, gave her garden to the dissentors, there was keen criticism of her forwardness. But in spite of fears lest its principles "harm the public peace," in 1669 the meetinghouse, "a small building of cedar," was erected.

Chief Justice Samuel Sewall was a prominent member of the congregation. For twenty-four years he was Precentor, "lining off the hymns," and he feelingly describes the trials of his office. "I set York tune," he writes, "and the congregation went out of it and into St. David's in the very second going over." It was here that he stood with bowed head while the minister read his confession of error in the witchcraft delusion. When Andros determined to set up the Anglican form of worship in Boston, he seized the keys of the Old South and there established the new society. Judge Sewall, in his diary, gives a picturesque account of the funeral of Lady Andros, the turmoil in the streets, the torches lighting the murky air of February, the crowd within the church, and the difficulty of keeping them quiet.

In 1729 the cedar meetinghouse was torn down and the present structure erected. A few years later came the first of its great moments of silent waiting, broken with true dramatic climax. D'Anville's fleet was on its way from France to destroy New England. The Old South held a day of fasting and, in the hush that followed the prayer of Dr. Prince, a gust of wind shook the windows and the tower so that it tolled the bell. That very gale was the destruction of the French fleet and New England was safe.

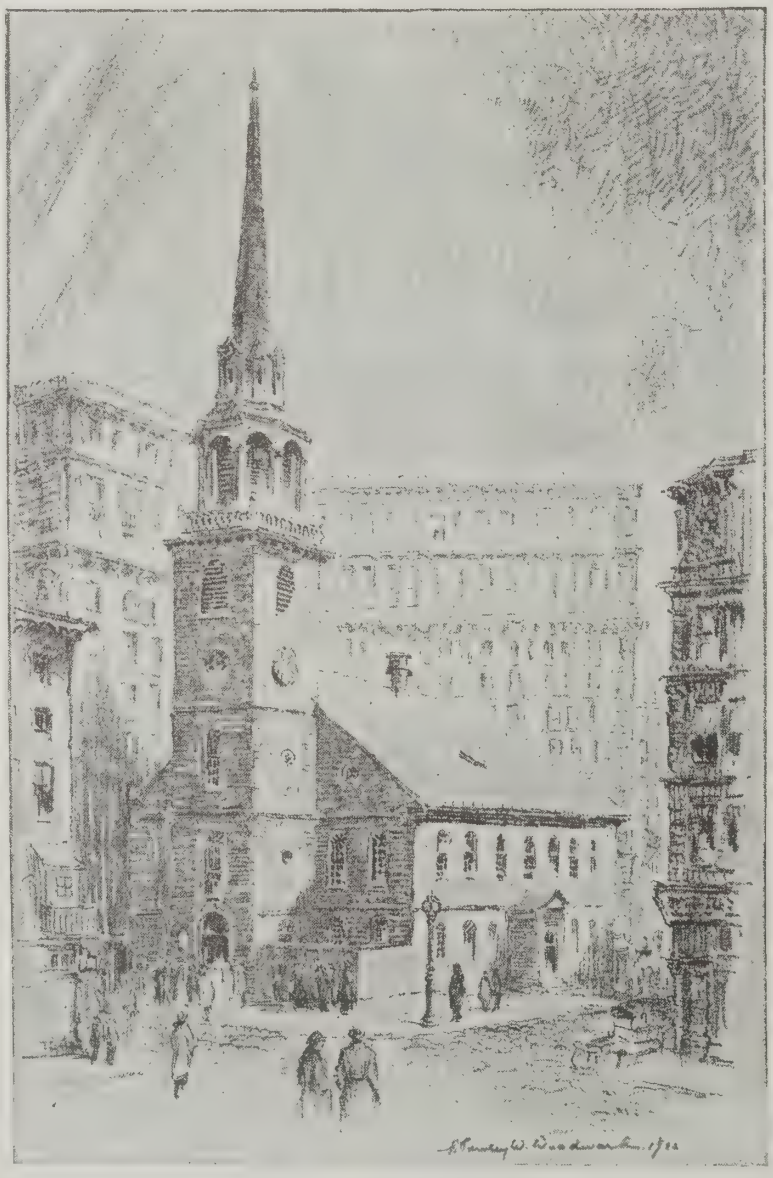
But before long a greater danger threatened, and the Old South became the scene of town meetings so large that Faneuil Hall could not accommodate them. The first recorded one was in 1768 when the battleship *Romney* sailed into Boston Harbor and impressed two men. Governor Bernard did not dare to resist the will of the Old South and induced Captain Corner to make public declaration that he would impress no more men of Massachusetts although he had sworn that he "would make their heart ache" before he left.

Early in March, 1770, occurred the Boston Massacre, the first serious clash between the soldiers and the citizens. The next morning a committee waited on the governor to demand withdrawal of the troops, and in the afternoon the people assembled in the Old South Meetinghouse to learn his answer. The crowd filled the building and Washington street as far back as the Old State House, and they were still pouring in from the neighboring towns. At last there was a murmur, "Make way for the Committee," and Samuel Adams appeared with the message that the governor had refused, although Colonel Dalrymple offered to withdraw one of the regiments to the castle.

In the solemn hush that followed his announcement the moderator put the question: "Is that satisfactory?" and the walls trembled with the "No" that was the answer. Adams was once more dispatched to the Council Chamber of the State House. It was dark when he returned to the assembly still waiting in the church. The governor, overawed by the determined manner of "the great incendiary," had yielded, and Lord North always afterward referred to those troops as "Sam Adams' regiments."

No meeting in the Old South Church was of greater moment than the one on the eve of the Tea Party. For nineteen days the *Dartmouth*, with tea on board, had lain at anchor beside Griffin's wharf. On the twentieth she would be subject to seizure. Couriers had gone through all the neighboring towns to give warning of a call to arms in case there was any attempt to land the tea by force. On the morning of the twentieth a committee accompanied Mr. Rotch, the owner of the vessel, to the collector of customs, to see that he demand a letter of clearance for his ship. Rotch stated that he was compelled to make the request by "a body of men sitting in the Old South Meetinghouse," and the letter was not granted. But Rotch's reluctance did him no good, for he was sent in all haste to the governor, who had withdrawn to Milton and the meeting in the Old South adjourned until three in the afternoon.

By five he had not returned. Candles were lighted and in their flickering light Adams and the younger Quincy by turns addressed the assembly. At length Rotch appeared. The governor had not issued the pass. For a moment there was absolute silence in the church, broken by the solemn words of Adams, "This meeting can do nothing more to save the country." Then a war whoop sounded at the meetinghouse door, echoed by one in the gallery, and those pouring out of the church saw a band in Indian garb making for Griffin's wharf. By dawn the *Dartmouth's* load of tea was strewn on Boston harbor.



The Old South Meetinghouse.

The anniversary of the Boston Massacre was always commemorated in the Old South by a patriotic address. The March following the tea party, when Boston was closed by the Port Bill, the youthful Hancock was the orator. The following year, when friction was even greater, and the British officers declared that it would be worth any man's life to speak of that event in public, Warren offered himself for the post of danger. The church was crowded to overflowing. The pulpit was draped in black, and in it sat Adams, Hancock, and the selectmen. British soldiers in bright uniforms crowded the aisles, and the moderator gave up his seat and requested those in the front pews to vacate theirs. About forty officers came forward and sat in the seats and on the pulpit stairs.

The hour for the oration came and there was no speaker. The audience was becoming uneasy when a window back of the pulpit opened and Warren appeared. Fearing lest his arrival in the crowded church be the signal for a tumult, he had secured a ladder and taken his enemies by surprise. Never was there a more oppressive silence than that in which he made his entrance. As one member of the assembly wrote, "Each man felt the palpitation of his own heart and saw the pale but determined face of his neighbor." Yet Warren gave his oration without serious interruption. At one point an officer sitting below him on the platform held up his hand with several bullets in the open palm. Warren dropped a white handkerchief over them and continued his discourse without pausing.

Only a few months after his memorable oration, Joseph Warren lost his life at Bunker Hill and Boston was in a state of siege. Then the British wreaked their vengeance on the edifice which had so often been the scene of their humiliation. By Burgoyne's command the pews were taken out and either burned or used as troughs to feed hogs, and the parsonage, which had been the original mansion house of Governor Winthrop, was destroyed. About a foot of earth was spread on the floor, a leaping bar was set up, refreshments were served in the gallery, and the Old South became a riding school for the Queen's Light Dragoons to practice their horsemanship. In winter, the fire in the stove was kindled by the pages of Dr. Prince's New England Library, which was kept in the "steeple-room."

Many were the protests against this defiling of the sanctuary. One old lady used to pause daily by its door and call upon the spirit of old Dr. Sewall to arise and avenge his meetinghouse. One night a Scotchman on guard thought that he actually did see the ghost of that departed worthy, and his screams of terror aroused even the sentry at the Province House. He was really ill with fear and nothing would pacify him until, being asked how the spirit was dressed, he replied in long cloak and wig, and he was assured that the Puritanical Sewall had always refused that latter adornment. Some soldier, on the expedition to Lexington, had rifled the clergyman's wardrobe, and played a joke, that came near having a serious ending, on his superstitious comrade.

When the British evacuated Boston in March, 1776, and Washington entered the city, the first place he visited was the Old South Meetinghouse. "Strange," he murmured, as he looked down from the gallery at the willful mutilation of the interior, "that the British who so venerate their own churches should have so desecrated ours."

But in the days of national prosperity a desolation greater than that wrought by alien hands threatened the Old South. In 1876 the owners offered the building for sale as brick and mortar. Indignation flared up, and twenty-five women of Boston banded themselves into a "preservation committee." Possession was purchased for seven days, the old edifice was decked with flags, and once more it echoed to patriotic words, Emerson, Lowell, Holmes and others contributing poems and addresses. The leading spirit in the great enterprise was Mary Hemenway, who herself contributed $100,000 of the necessary funds.

Every year, in the summer or autumn, a course of lectures is given to young people of high school age, and subjects for essay competitions are announced, the winners of which are named at the Washington's birthday meeting. Twice a year a "children's hour" is given for younger pupils. One of the most important branches of the work is the publication of the Old South leaflets, which are reprints of the sources of history. The issues vary in scope from Columbus's letter to Sanchez, to Governor Hutchinson's account of the Boston Tea Party. No other building has been so closely associated with the forming of the nation, and it has richly earned its title, "The Sanctuary of Freedom."

We Visit the Poet Laureate of England

A Night at Chilswell: Poet Plays Solitaire, Smokes His Pipe and Discusses Poetry

By GEORGIA JACKSON SCOTT

Robert Bridges has been asked to fill the chair of Creative Art at the University of Michigan for the year 1923-1924, and expects to sail for America in December.

And country life I praise
And lead, because I find
The philosophic mind
Can take no middle ways;
She will not leave her love
To mix with men, her art
Is all to strive above
The crowd, or stand apart.

IT IS not every day that vagrant Americans may visit the Poet Laureate of England, so we were pleased with our invitation to spend a night at Chilswell, the country home of the Bridges family. It lies on Boars Hill, a few miles out of Oxford. We climbed trustingly upon a bus said to run to Boars Hill, and so it did, to be sure, but we learned when we were well under way that it had the disconcerting habit of turning some two miles from our destination and going off in another direction. So presently we found ourselves stranded at a crossroads with no friend in sight but the little white signpost, and with a heavy suitcase on our hands. The country around was beautiful, as only English country can be beautiful, with its rolling pastures, its hedges and trees in clusters, all miraculously sunny and still. At any other time we should have welcomed the prospect of walking the two miles, but our joy was tempered by the thought of our burden. As desperate situations require desperate courage, we commandeered an automobile that was headed for Oxford, induced the kind young man at the rudder to turn about, take us aboard, and drive us through the tree-fringed roads up the hill to Chilswell. We passed the gate, drove through a bordering grove, and around a corner suddenly came upon an opening. There, beyond a graveled approach, lay a plain-faced stucco house sleeping in its gardens.

Our knocking was answered by a maid, who let us into a wide, long hall, which sounded the keynote of the whole dwelling —light, free spaciousness. She led us to the drawing-room, where Mrs. Bridges came forward to greet us—a smiling gray-haired woman in a dark blue silk dress and a garden hat. She had obviously just come through a French window. She is an active, friendly, gentle-mannered lady, and her greatest charm is a smile of such sunniness that one feels instantly it is an index to a character both beautiful and good. It is supposed to be hard to live with a poet, but no traces justifying the tradition are to be found in this gracious woman. She has a delicate and delightful humor, and a lovely half-diffident air of taking you immediately into her confidence, though, of course, since she is an Englishwoman, you know perfectly well she does nothing of the kind.

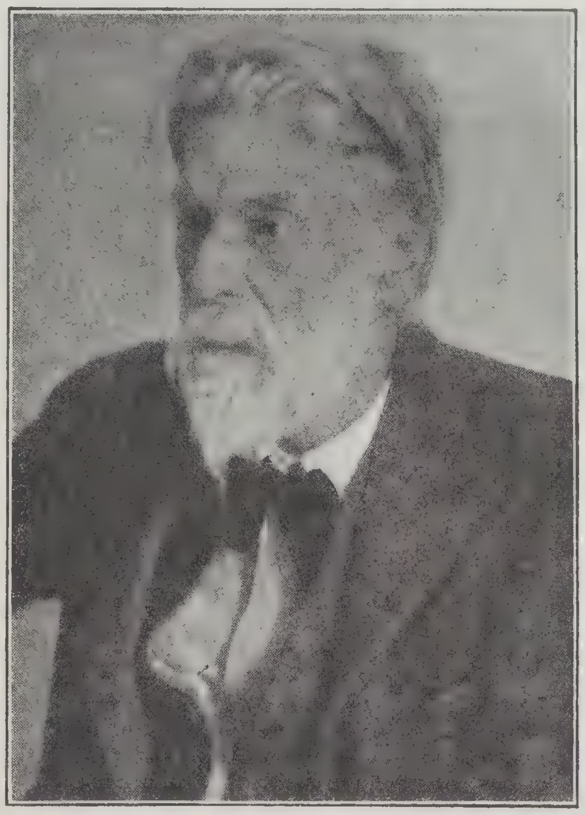
The drawing-room was a comfortable apartment with a log fire burning in the large fireplace, and with cheerful chintz-covered armchairs and sofas. All one side was given over to windows opening on the garden, where one could look across nasturtium beds to a lawn, trees, and, in the long distance, blue hills. On another side there was a French window leading to a veranda.

The table was set for tea, and almost at once the daughter of the house came in. At first I took her for a college girl, but she assured me later, laughingly, that she was past college age. In through the French window appeared the poet himself.

Mr. Bridges is a picturesque figure, wiry, towering, and vigorous, with thick, iron-gray hair and a gray pointed beard. He was dressed in a lounging suit, very careless and comfortable, with a gay tie, gaily tied. His dark eyes are full of fire, and he fixes his interlocutor with the steady gleam of the Ancient Mariner. He greeted us with a fine cordiality, his deep voice booming kindliness. In speech he is abrupt, humorous, despotic. When he is talking of subjects in which he is interested, he is all enthusiasm, speaking rapidly and well, though caught up short now and then with a momentary stutter, which does not in the least detract from the effectiveness of his speech.

Miss Bridges served tea in blue and white cups. It was real English tea; one learns to expect a strong cup, and most persons here take milk and sugar. Cream is seldom seen in London save at the more expensive restaurants, but here we were in the country, and Miss Bridges put whipped cream in our tea, and gave us graham bread sliced very thin and buttered, currant cake, and small cakes.

After tea Dr. Bridges took us out to the garden, and up a walk to a point where could be seen the best view of the surrounding country. Far away, perhaps twenty miles, stretched the Chiltern Hills, on one of which we could faintly see the white cross said to have been cut in the turf to celebrate some Christian victory over the Danes. Down in the valley to the left lay Oxford—



ROBERT BRIDGES

The lovely city, thronging tower and spire,
The mind of the wide landscape, dreaming deep,
Gray-silvery in the vale; a shrine where keep
Memorial hopes their pale celestial fire:
Like man's immortal conscience of desire,
The spirit that watcheth in me ev'n in my sleep.

Far to the right was a group of the red brick houses so often found in English towns, which make such a pleasant picture in their setting of trees and hedges. On closer acquaintance they often prove to be row on row precisely alike, two stories high, and all with their gardens and their little chimney pots. Mr. Bridges pointed out, also to the right, the place where runs

The silver Thames,
Shady with birch and beech and odorous pine;
And brilliant underfoot with thousand gems
Steeply the thickets to his floods decline.
Straight trees in every place
Their thick tops interlace,
And pendant branches trail their foilage fine
Upon his watery face.

We went through the rock garden, a pleasant maze, shoulder high, cut in winding paths with walls built up on either side of gray rocks placed, so Mr. Bridges told us, with his own hands. In the interstices of the rocks and overgrowing the stones themselves were the vines of pinks and phlox, rambler roses, and tiny trees and shrubs. "Children like to play here," commented the poet.

As we approached the house, Mr. Bridges drew out a pipe and excused himself to go in quest of tobacco. We strolled down a walk lined on each side with small cypress trees, which led to the kitchen garden; here were more flowers; snapdragons, lavender, sweet peas, roses, and some whose names I did not know. The walk ended in a curved white seat, set in a screen of clipped yew that circled it on three sides. "That yew," explained Mr. Bridges, who had rejoined us, "I planted only fifteen years ago, and already it looks as if it had grown there for a hundred years." On this side of the house stood a white windmill, idle. "That gives us all our water supply," he said. "It has done its work for today."

Mrs. Bridges came down the path, and she and I left the men, and went for a stroll and a chat along the garden walks. I had noticed some buildings at the far end of the kitchen garden. As we approached them, Mrs. Bridges asked, "Would you like to see the aristocrats?" I looked into one of the pens. There were four half-grown pigs, all black. Why should a poet not have pigs? Poetry must not altogether lose contact with reality, and what fitter symbol is there of the material world than a pig? "Excellent!" I thought to myself, and asked, "Are they named?" "No," she replied, "they have to be killed, you see, so we don't make too much of them. But here," she added with a gay little flourish, "here is Mamma." Mamma, a great black sow, lay stretched at full length, taking her ease. She declined to pay any heed whatever to her admirers.

Presently we all went back to the house and visited the poet's study. It occupies what is practically a house all by itself, connected with the domicile proper by a long corridor all glass on the garden side. It is one great room, full of books and tables and easy chairs, and of course there is a large fireplace. Remote from the daily business of the home, its windows looking out on loveliness, it is a scholar's heaven.

When we returned to the drawing-room, Mrs. Bridges gently sent the poet to his study "to work for an hour before dinner," explaining that he had agreed to do some work that must be finished as soon as possible. "I usually work four hours every morning," the poet told us, "and that is about all I can do in a day, unless I have something urgent in hand."

We were shown to our room. Up the stairs we were led, into another spacious hall, and found our room a large one at the front of the house, each of its windows looking out into the grove. Jock, a little gray Scotch terrier, was patrolling the drive before the house with an important air, occasionally bursting into rapturous barks and running madly about, pretending to himself, no doubt, Mrs. Bridges suggested, that he saw a rabbit.

Dinner was served in a handsome dark dining room. There was white wine, of which we, being thirsty Americans, partook, but I noticed that none of the Bridges family took any. Among the topics that came up at table was American poetry, and while Mr. Bridges disclaimed intimate knowledge of our contemporaries, he seemed to know a great deal about them. He spoke favorably of Robinson, Frost, and Lindsay. Emerson he mentioned with some intensity. He did not like Emerson's poetry. I remember someone said that there were nevertheless some great passages in it. Mr. Bridges being obviously dammed up by that comment, I said, "He certainly did not have a strong poetic sense." "None at all," Mr. Bridges burst out with vehement gratitude. "I think people like his poems because now and then he happens to strike on some idea they admire or some thought they have had—they like to find that thought and they don't stop to ask if the expression of it is really poetry." Such judgments are characteristic of his discourse, but, as one admirer of his put it, "If you don't have convictions when you are seventy-nine, when will you have them?"

After dinner, coffee was served in the drawing-room. The ladies took some sewing, and the talk was varied and general. The room was lighted with oil lamps. Miss Bridges, who is a pleasantly cynical-minded young person with the full family quota of humor, asked many questions about America. None of the family has yet ventured across the Atlantic, but their attitude is of the friendliest, and if they have prejudices of one sort or another, as is the case with most English people, we were not permitted to feel them. If Dr. Bridges accepts the invitation extended to him to spend a year at the University of Michigan, which seems very likely, it is fortunate that Ann Arbor's green quietness will be his abiding place.

The poet got out a table and began to play solitaire as he talked, apparently without any difficulty in attending to both occupations, for he talked about books, writers, poets, language, and words. He is especially interested in movements for keeping the English language uncontaminated, and is an active member in and edits the publications of the Society for Pure English. In fact, his scholarly interests are quite as near his heart as is poetry.

At bedtime, tea and hot milk were brought in, and then we were given a candle to light us up the stairs. Presently a tap at the door announced that a bath was ready. Although the country home uses oil lamps and candles and has no telephone (Mr. Bridges does not like the telephone), it has a well-equipped, modern bathroom.

In the morning about half-past seven, following a tap at the door, a maid came in with a cup of tea for each of us, opened the curtains, brought in the inevitable English can of hot

(Concluded on page 14)

Just a Little Matter of Twenty Billions

That's the Difference Between Extremes of Opinion as to What All the Railroads Are Worth, Which the Government Is Trying to Establish

By ROBERT KENTON

Railroad valuation may be one of the big issues in next year's national campaign. On it depends practically every proposed solution of the railroad problem. For nearly eleven years the government has been trying to fix it. The complications are many and involved. How would you find the value of these immense properties? There are numerous ways by which it might be done, but each of them is disputed by some of the several schools of thought taking part in the discussion. This article tells of them, and of the progress of the work to date, leaving you to decide which school of thought is right.

"YOU can't unscramble eggs," a big financier once declared with reference to disentangling the inner affairs of great railroad or industrial groups.

For a period approaching eleven years, the Federal Government has been trying to prove that the statement is not true insofar as it relates to the railroads. In endeavoring to establish the real value of all the railroads in the United States, Uncle Sam has been wrestling with the biggest job of at least theoretical "unscrambling" ever attempted anywhere.

How is the job coming along? The task is such a complicated one that no one exactly can tell—in fact, it is so terribly mixed up that virtually no one has attempted to tell fully just how it is succeeding, or the contrary. However, it is one of the most important tasks which the government is performing; for this work lies at the very basis of any possible equitable straightening out of the railroad problem.

The job has to do chiefly with values, but the work involves many other things; for example, the elucidation in full detail of the histories and the finances of each and all the railroads in the country. Several railroads are now nearly one hundred years old. Some are owned by corporations that were evolved out of from one to three hundred prior corporations, many of these with their records having long ago passed entirely out of existence. In the building, operation and consolidation of railroad properties a thousand different kinds of promotion and "financing" were employed. Until recent years there was no requirement that a uniform system of account-keeping be used. Many properties have changed hands numerous times. However, out of the musty records of the past the government, through the Interstate Commerce Commission, has dug the most gigantic volume of data that probably was ever collected on any other single subject. The data still are incomplete for all purposes in the minds of those who have gathered them.

For instance, the first purpose aimed at is the establishment of "original cost to date" of the railroads, which, in despite of the fact that the law calls for it, the Interstate Commerce Commission holds to be virtually impossible.

May Take Another Decade

CONGRESS didn't tell the Interstate Commerce Commission to get busy and find what the railroads are worth. Two or three experts probably could determine that in a few months' time. Instead of saying, "Find out what they are worth," Congress directed that different elements or aspects of value be ferreted out and reported on separately. Hence the work has spread through a decade and may go through another before it is finished, even if as carried on, it is ever fully completed.

The commission is expected to report for each railroad property its original cost to date, the cost of its reproduction new; its cost of reproduction new, less depreciation; the original cost and prevailing value of land owned or used and "other values or elements of value, if any," together with general finance and organization histories, and incidental matters that need not be gone into here.

On the job something like 1,200 accountants, engineers and lawyers have been employed by the government, which has spent on the undertaking to date about $25,000,000. The railroads, which are required to render any assistance required of them, have spent upon it nearly $75,000,000.

Yet the real value of no single property has yet been established, and probably won't be established for several years to come. Figures galore have been put forth, but all admittedly are incomplete insofar as the finding of present exact value is concerned. And even after all the figures are set forth, the courts very likely will have to say how they shall be interpreted. Ultimate Supreme Court rulings on the mere meaning of words and phrases may cause final figures to be changed in amounts covering billions of dollars.

To illustrate: What is "original cost to date?" Offhand you would say that it is the amount of money which has been invested in the properties. But suppose much of the money was wasted, or stolen? Should that be accounted as "original cost"? Suppose, too, as actually is the case, that much of it wasn't money at all, but only sheets of paper—stock—that represented no investment except the cost of printing it? Should that rank as cost? Suppose, too, that much that was invested came from the public in the form of earnings, being the capitalization of surplus. Should that be calculated as original cost?

There are varying opinions as to the correct answers.

When and however arrived at should "original cost" measure or be the leading factor in measuring present value? You must not forget that when many dollars were put into "original cost" they were worth much more than dollars are now. Should allowance be made for this? There is quite a difference of opinion here.

If you don't accept "original cost" as the basis of present value, you must then look to the "cost of reproduction." How would you arrive at that? Would you estimate it at what the various things—roadbed, rails, locomotives, cars, land—cost when actually acquired, or would you estimate it at what they would cost if bought now? Here arises, too, the difficult problem of appreciation and depreciation and of "unearned increment."

Railroad land, for example, as a rule, would be of little use for other purposes if abandoned; there are exceptions, as in the case of terminal property. Much land was given to the railroads. How would you value their land now—at what it would cost if newly acquired, at what it actually did cost, at what it would be worth if abandoned for railroad purposes, or at the average value of adjacent land? There are vast differences of opinion here.

And what would you do as to "other values and elements of value"? Goodwill sometimes is a concern's chief asset, a successful going concern is invariably worth more in the market than anyone would pay for its physical property. In the case of the railroads would you allow anything for this, or deduct anything, where, as in some cases it is true, no one would pay more for the property than its worth as scrap?

As to these problems, there are two main schools of thought. One adheres to what is known as the "bone value" theory. It would allow substantially for nothing except the money which was "prudently" invested in railroad property as it exists now. This school would find when the various parts were acquired; then it would allow for them only what a prudent person would have spent on them at the time. The application of this theory would result in all the railroads being valued at probably less than $10,000,000,000.

The other school says that the value should be based substantially on what it would cost to replace the railroads now. This would result in the final total value of all the railroads being fixed at from $30,000,000,000 to $35,000,000,000.

There are several intermediary schools of thought. Among the owners of the railroads, for example, there are many persons who say that physical property has very little to do with it. They would predicate values on earnings, actual or potential. That is to say, if a road which cost $20,000,000 can earn on only $5,000,000 the latter should be fixed as its value. But if a road, wisely constructed and managed, should earn via reasonable rates on twice what it cost to construct it, it would be accordingly so valued.

Halfway Course Steered

THEN there are others who say that the value of the roads should be judged by the market prices of their securities. This for all the railroads is now estimated to be from thirteen to fifteen billions of dollars. This, however, is given very little weight in the fixing of values by the Interstate Commerce Commission, for it is held that the market prices of these securities are governed largely by what the government does with reference to rates and other matters affecting the railroads.

In fact, the commission seems to be pursuing a course midway between all extremes of thought.

It calculates cost of reproduction new, for example, by the reasonable investment theory. It makes an inventory of the physical property. Then an engineer imagines that it doesn't exist. Then he calculates what it would cost, if reasonably good judgment and management are exercised, to bring those parts together newly; and this is found to be the cost of reproduction new.

Actual findings, however, are as of June 30, 1914. Subsequent investments must be added and deductions also made for property that has since been retired. Whether anything will be added to the basic figures on account of the change in prices since June 30, 1914, has not yet been decided.

Land is valued at the average of adjacent lands.

Then a deduction is made for depreciation in roadbed and equipment. The rule of accrued or theoretical depreciation is applied. That is, if a crosstie with a prospective life of ten years is five years old, one-half of its value is deducted on the score of depreciation. The railroads dispute this policy. They claim that if a property is properly kept up it doesn't depreciate but on the contrary appreciates in value. They would allow only for actual depreciation, such as results from neglect or deferred maintenance. Three to five billion dollars are involved in this dispute alone.

After findings are made on separate aspects of value, the commission makes a finding of single-sum value for each property. This is not put forth as the real or present value. It is "for rate-making purposes only." And to date each of these findings is of June 30, 1914, and must be brought up to the present before it can be used.

What does the commission give chief consideration to in making these "final" or single-sum findings of value? Nobody knows. There have been several guesses but none of them holds true in all cases.

Generally, however, they approximate what the commission found to be the cost of reproduction new, less depreciation, with the present value of land added, and about five per cent added to that total, ostensibly for "other values and elements of value." In its orders stating single-sum values the commission declares that everything has been given consideration. But in none of its findings does it state what degree of consideration is given to any one thing. This is called the no-formula, "judgment" process of finding value. It is disputed on all hands outside of the commission. For, it is claimed that the values thus arrived at will be the mere "opinions" of different individuals; that these vary considerably as to different properties and with the changing personnel of the commission. One critic who has given much study to the subject says the values thus stated are "expert guesses—no more, no less." This and other methods used are disputed even by minority members of the commission. The whole matter probably will have to go to the courts before it is settled who is right.

Twenty Billions Involved

HOW the majority findings of the commission work in practice may be shown in two cases that have been reported on "finally" as of June 30, 1914.

One is a successful Western railroad, 988 miles long. Its total capitalization is $81,274,000. Its books indicate an investment of $76,381,598. The commission, however, held that the investment could not have been more than $43,180,160. It disallowed entirely one item of $25,000,000 covering capital stock which the commission held "represents no actual investment in property." The cost of reproduction new was found to be $43,153,118; less depreciation, it was $35,744,594; the present value of lands was found to be $4,156,227.

The commission allowed a single-sum or total value of $45,000,000, or about $45,500 a mile for the property.

The owners claimed that on an earning as well as an investment basis, the property was worth not less than $70,000,000. One commissioner, himself an experienced railroad man, agreed with them.

The other property is in the South. Its capitalization is $59,600,000. The commission found that the original cost to date of road and equipment could not have been more than $27,540,647. It gives the present value of land as $2,613,810. The cost of reproduction new is $26,000,000; less depreciation, it is $21,228 752.

The single-sum value fixed for that road is $23,245,000 or about $37,300 a mile.

The first road as stated is quite successful. The last road is almost a total failure; it probably could be bought tomorrow for considerably less than $10,000,000. Yet when these findings come to be applied rates will be based on more than twice the amount. The commissioner who would have allowed $70,000,000 for the first road would have cut the value of the latter to less than $10,000,000.

About 400 out of a total of around 1,800 properties have been reported on "tentatively." That is to say, the commission puts out a brief finding. Then all persons interested may be heard as to whether changes should be made in the "final" finding. Many hearings have been held but only a few subsequent reports have been made. A hundred or more first reports have become final through default or agreement. Only about one-fourth of the railway mileage has been reported on at all. None of the giant systems has yet been valued.

Those reports that have been made allow values averaging about $40,000 a mile for railroad properties. This, don't forget, is of June 30, 1914, and "for rate-making purposes only." The commission indicates that other values may be fixed for other purposes.

In many cases the value found just about approximates the debts owed by the railroads at the time of the valuation; in some it even is less. However, in some cases the amount is less than both outstanding stocks and bonds. Generally the value found is considerably less than the roads claim as actual investments, though in some cases the two are about the same.

These findings are separate and in great part distinct from the tentative value given all the railroads under the Transportation Act of 1920. The data on which they are based were considered in fixing that value, but the $18,900,000,000 allowed at that time comprehended many other elements of information.

When the commission completes its work under the Valuation Act, the figures thus procured will supplant the tentative ones now used in fixing rates on a "fair earnings" basis, that is, if the laws remain as at present.

But as the work is going on now it will be a very long time before it is finished. The inventories are the only part of the work on which there is agreement.

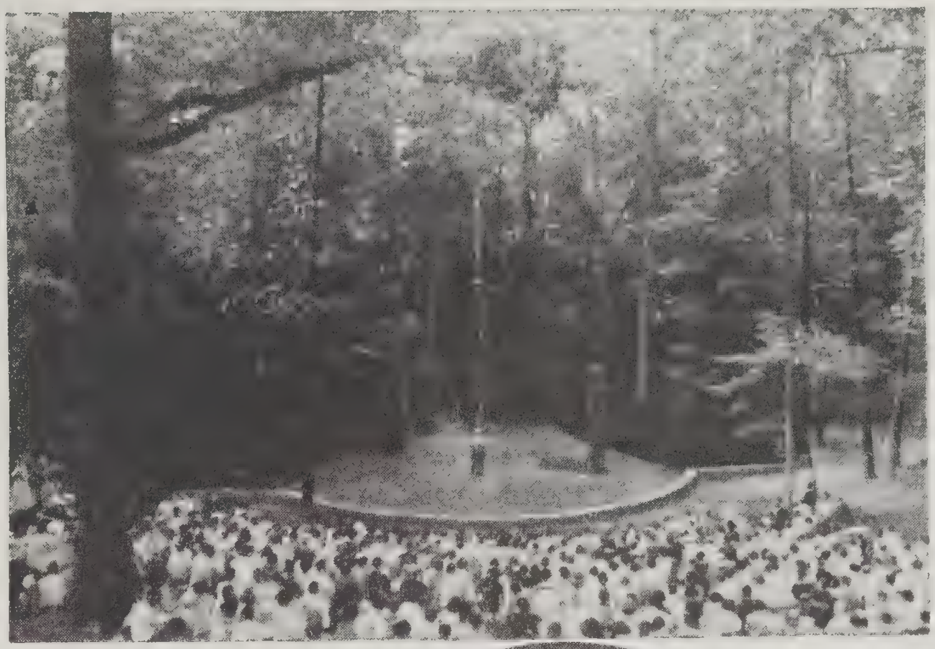
On virtually all else there is dispute, and these disputes involve very intricate questions of law and procedure. Until some specific action is taken on the basis of the values being established—action like the fixing of rates—to leave the doorway open for claims as to confiscation, it may be impossible to get the important questions before the courts.

Involved in these disputes there is around $20,000,000,000—which is about the difference in the values contended for by the extreme schools of thought taking part in the controversy.

PROFESSOR FREDERICK H. KOCH.

American Drama Which Comes From the Heart

The Carolina Playmakers and Their Virile Folk-Plays Point the Way to a People's Theater



A scene from "Much Ado About Nothing" in the Forest Theater, lovely outdoor play-place of the Carolina Playmakers at Chapel Hill, North Carolina.

By J. OLIN HOWE

Right—In this tense scene from "The Miser," a farm tragedy, "Ida Lucas" threatens to kill her father, the stingiest man in Harnett County, unless he gives her money to rescue her brother's family from influenza.

HAIL to Frederick Koch and the Carolina Playmakers! These are the students of English 31, Professor Koch's course in dramatic composition at the University of North Carolina. At Chapel Hill they are leading the way to a real American drama, doing a notable thing of keen interest to the rest of the country. These Playmakers stage the drama that is in the life about them in one-act plays of unusual quality.

And there is drama in the Tar Heel State—rich store of romance, of pathos, of sentiment, of comedy, great wealth of distinctive characters, and a picturesque background of history, legend and tradition. Mountain communities in the fastnesses of the Great Smokies are at one side of her five hundred miles of breadth and at the other, straggling villages scattered among the sand dunes which border the Atlantic.

Less than two per cent of North Carolina's population is foreign-born or of foreign-born parentage. Think of the wonderful material for folk-plays among those whose folk-consciousness goes back practically untouched to the original settlers who came from England.

The lore of those first families has come down by word of mouth through successive generations, and added to it are the folk-tales of a people whose recent past held outlaws of mountain and upland and pirates of the Hatteras shoals. In neighborhoods far off any beaten track manners and customs of bygone centuries survive today unchanged. Word and phrase strange to the newer life of later years are common in their dialect.

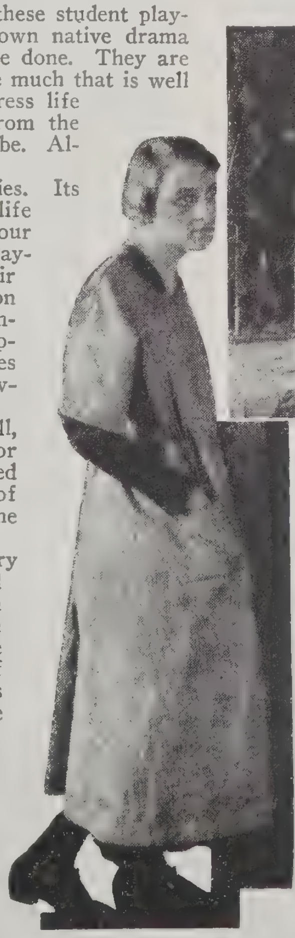
All this is handled splendidly by these student playmakers, who are building up their own native drama and showing the world how it can be done. They are also adding to our dramatic literature much that is well worth while. Their little plays express life close to the soil and are written from the heart, as truly successful plays must be. Always the material is first-hand.

North Carolina has no large cities. Its life is pretty much that small-town life which is the solid foundation of our social structure. The Carolina Playmakers tell intimate stories of their own locality and thus find a common denominator with the rest of humanity. Their plays have universal appeal because they go to basic qualities which characterize human nature everywhere.

These are produced at Chapel Hill, with the Playmakers responsible for every detail. Once they have gained the university's approval, the best of the plays are taken on tour over the home state.

At times they are given in the very locality which furnished story and characters for one or another, when that special acclaim is theirs which comes from understanding and is the finest tribute. Much material of which new plays can be made is brought to their attention in these towns where the Playmakers are looked upon with pride and their coming eagerly awaited. Here and there over the state they even produce some of the plays with local talent and invite Professor Koch to put on the finishing touches and speak to the audience.

The wide range of material in North Carolina's past and present means interesting variety of theme. There are plays of the farm, mostly tragedies, plays of daring outlaws of coast or back lands, mountain plays of moonshiners or some spirited adventurer, plays featuring a stirring bit of colonial or later history, plays founded on strange legend or haunting mystery of other days, plays of that folk-belief in the supernatural still so strong in remote sections of the state, plays of the North Carolina of the present, with its rising tide of industrial life and its social problems—even plays written for the Negro theater.



KATHERINE GALLOWAY BATTS,

One of the most successful of Professor Koch's young actresses, as the wife in "The Lord's Will," the tragedy of a country preacher.

In "Dod Gast Ye Both!" a play of moonshining in the North Carolina mountains, Hubert Heffner, the author, plays "Sink," the bootlegger at the extreme right of this scene.

No playmaker's play is born to the purple or travels a primrose path to the footlights. The student reads his first draft to the class. The spirit of its criticism is kindly but none the less searching. If the budding playwright stands this well and comes back for more, a play may very likely result fit for an author's reading. During each university quarter, six plays are selected for this crucial test in a college auditorium, to which the public is invited.

A faculty play committee, made up with special care to get representative shades of opinion and changed from time to time, chooses the three best suited to production. These the cast committee of this harmonious community of amateur playmakers takes over. Casting is ever a delicate matter. Candidates need but offer themselves for tryout in response to the call. The Carolina Playmakers are a corporation, but not a closed corporation. Sometimes, however, the promise of the tryout is hardly fulfilled and changes in characters may be necessary when plays have been in rehearsal two weeks or more.

There are usually four weeks of daily rehearsals, with Director Koch in general supervision and an assistant in charge of each play. In these busy weeks practically everybody in the community contributes something.

The Playmakers have their own little theater. This building was once the law school of the university and is now reconstructed for their use. Its stage is twenty-two feet across the front and fifteen across the back, twelve feet deep and nine high. Scenery used at Chapel Hill would fit almost anywhere. It is merely painted cloth, but most effective.

On pre-shrunk bleached muslin, covered with glue to give a solid surface, these amateurs paint three canvases for a scene, one for back wall and one for each side, and cut doors and windows where indicated These are affixed to poles, from which they hang when in use and upon which they are readily rolled for transportation. A portable, homemade lighting set devised by the university's engineering department supplies all needed effects.

Frederick H Koch is a leader in the movement for a people's theater in the United States consciously and purposefully. Of these Carolina Playmakers he says: "They are striving to satisfy the desire of the people everywhere for a drama which will be genuinely communal, for a theater democratic, which will adequately interpret their own life, giving to every man a means of expressing himself in creative play. They hope to contribute something of permanent value in the making of a new folk-theater and a new folk-literature."

Koch has been at Chapel Hill since 1918. More than twenty-five original folk-plays and several modern plays have come out of these five years. The Playmakers once each year put on a Shakespearean classic.

This is staged in the beautiful Forest Theater in a fifty-acre tract of native woodland. A hill-slope seats several thousand and a low semicircular rock wall is the proscenium which marks the border between the world of reality and make-believe-land.

"Peggy" was the first of notable farm plays, others of which are "The Miser," a rustic tragedy in which old Wash Lucas, stingiest man in Harnett County, figures; "In Dixon's Kitchen," a country romance complicated with the problem of little brother and still in demand when the Playmakers are on tour.

"Dod Gast Ye Both!" comedy of mountain moonshiners which has had great success, tells in a striking way of young love for a revenue officer and the clash with a stern father's will.

One day Broadway may see these plays. But the encomiums of Broadway would be small addition to the laurels earned by these Carolina folk-plays at home. They are the real thing in American dramatic art—and of that Broadway knows little

Shipping for Good of the Voyage Whether on Land or Sea

That's What E. A. Lemoine, A. B., Has Found in Life After Coming Into Ministry

By the REV. E. A. LEMOINE

FROM sailor to minister; is it an evolution or a retrogression? Perhaps it is neither, when viewed in the light of the contribution that each makes to society. Both are essential; for it would be a strange world without ships and churches. And he who sails in the merchant marine, no less than he who cruises in the Gospel ship, has his moments of exaltation and genuine happiness. Indeed, as I stroll up and down the corridors of my mental life looking for some of the most pleasing scenes in my experience, I see a barefoot boy, clad in shirt and overalls, living upon salt beef and hard-tack twenty-one times a week, now working about the deck, now taking his turn at the helm, and now high in the air wrestling with a sail full of wind.

These were days of hardships, but also of delight, as the gallant ship measured the leagues between the different ports. Did a squall cast its gloomy shadow across our bow, it only added to the charm; it thickened the plot; it accelerated the action. For the harder blew the wind, the faster went the ship, and the louder roared the officers, and, it must be added, the worse the sailors swore.

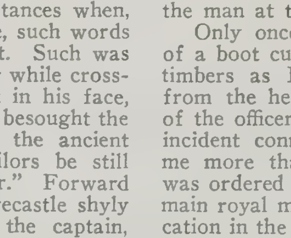
I shall always remember my first trip, while still a boy, on board a square-rigger crossing the Atlantic. We had been but a few nights out from Halifax, Nova Scotia, when a wild northwestern gale overtook us. The officer in charge sent me to call the watch to take in sail. With thoughts apposite to one who thought that his time had come, I ran to the forecastle, slid back the forecastle door and shouted, "Ah, you sleepers, heave out and take in sail!" But what a shock my pious thoughts received when biff, bang, out through the forecastle door they came black and blue, strong and long, not a white one among them, just salt-water oaths on the weather, the ship, the man that sailed her, and the company that owned her.

Now if one cannot get along without using such language, the proper occasion is a time similar to that to which I have referred. For in circumstances when, to the inexperienced, death seems inevitable, such words and acts of levity have a stimulating effect. Such was the experience of a pious but timid minister while crossing the ocean. With the look of the lost in his face, and the tremor of the grave in his voice, he besought the captain for a ray of hope. "Sir," said the ancient mariner, "go for'ard, and see if the sailors be still playing cards. If they be, ther's no danger." Forward the man of God went and down in the forecastle shyly turned his eyes; then hastened back to the captain, wringing his hands for joy, as he exclaimed, "Thank God, they're still playing cards!"

Although he did not know, however, it is quite likely that every time the roll and plunge of the ship disturbed their "jack pot," they used him as a target for their impolite language. For sailors of the bygone days were very superstitious. From their point of view a ship carrying a woman or a minister must be prepared to encounter gales and numerous other disasters. The sailor of today pays no attention to those things. The steamship has, of course, supplanted to a very large extent the old square-rigger, and with its going there has passed, or there is passing, the old tar with his quaint views and practices.

Years ago it was a fascinating work to get a square-rigger under way, for not much, if anything, was done without song, or "chantey," as the sailors call it. The charm of one which has been universally sung while heaving up the anchor goes thus:

"Heave away for Rio, away, Rio;
Sing fare-you-well, my bonnie young girl,
For we're bound for the Rio Grande."



E. A. LEMOINE, A. B.

Given about twenty-five sailors half drunk, or, as the sailors say, "three sheets in the wind," and for downright enjoyment a Manhattan opera company is quite tame in comparison.

It is true that the square-rigger may still be seen, but the condition on board is changed. The brute discipline which prevailed when I was a youngster has collapsed. I still remember a clause in the articles of agreement which the older sailors had to sign. It read: "Shipped for the good of the voyage, master's interest, boat or shore, night or day." And often those deep-sea going ships were in reality what the sailors called them, "Hells afloat."

I was unfortunate enough once to be shipped on one. Her name was *Cora*. She was bound from Cardiff, Wales, to Cape Town, South Africa. There was no limit to the cudgeling with marlin spikes and belaying pins, which the sailors call "marlin spike soup and belaying pin hash." As to the more literal rations, they consisted of salt beef, or, as the sailors say, "salt horse," twenty-one times a week, and hard-tack, alias "Liverpool pantiles," which were hard enough to put a quietus on an ox, and whose insides were the birthplace and cemetery of threescore generations of insects. Fortunately from these there was no danger, for if perchance they safely passed the teeth, a swallow of coffee, or "bootleg," as we called it, overtook them on the way down, and from that there was no possibility of escape.

After about three months we arrived in Cape Town. And most of the sailors deserted, leaving clothes and wages behind rather than face a similar ordeal on the home trip.

This wholesale desertion necessitated our shipping another crew, and a crew it was! deserters from the English army, longshoremen, farmers, and other members of the "landed gentry" whom a venal boardinghouse master had duped and put aboard. It was amusing to us, who were sailors, and had faced the music on the outward trip, to see our surly mate getting after them. Taking off his weather-beaten cap, throwing it on the deck, and dancing a frenzied reel upon it, he would bellow: "Sailors we don't want; soldiers and farmers we have got; thinkers and tailors we've got to get; blanky, blanky, blank, blank!"

But you could hardly blame him. For even if you stationed them on the lookout, you felt that they would do as the green Irishman did who, in mid-ocean, seeing the green and red lights of an approaching vessel, came running aft and shouting out, "Kape her off, Captain! For God's sake, kape her off, there's a drug store right ahead!" As to steering, that was impossible. Many a time I was envious of their ignorance, for few places are more suited to make a man forget his religious training than the helm of a full-rigged ship with a strong wind on the quarter. And when the captain's orders are heaven, hell or the port to which you are bound in so many days, any deviation from the straight course in steering gives him an occasion to vent his wrath on the man at the helm.

Only once on the *Cora* did I feel the pointed toe of a boot cutting me abaft the beam and shivering my timbers as I went lurching over to lee. But apart from the helm I frequently fell under the displeasure of the officers, and received my just "rewards," and an incident connected with one of my punishments hurt me more than the punishment itself. At midnight I was ordered to take a piece of porkskin and grease the main royal mast. While looking for this piece of lubrication in the dark storeroom, I made an unfortunate discovery. Deep into the pickle of one of the barrels I thrust my hand, but when it came out, instead of porkskin, it was holding a huge rat which, presumably, had been salted down with other delicacies for sailors' use. This unfortunate discovery deprived me of my appetite for meat during the rest of the voyage. Regardless of how much the old American sailor relished a good piece of "horse flesh," he drew the line on rats. As to the former, it was often "hallowed" before being eaten by saying the following "grace": "Old horse, old horse, what brought you here? You carted coal for many a year; and when you were good for no other use, they salted you down for sailors' use. The sailors they do you despise; they roll you over and curse your eyes; they turn you over and pick your bones, and throw the rest to Davy Jones."

By this you can see that the old sailor was not altogether void of religious feelings. His code of ethics, however, differed from that of the landsman. The latter says: "Thou shalt not steal." The sailor qualifies that by saying: "Thou shalt not lift the lid of thy shipmate's locker to take his money, but as to his tobacco and whisky, the Ten Commandments are not binding."

But the commandment most sedulously enforced on the *Cora* was the fourth, or rather the nautical commentary on it, which reads: "Six days shalt thou labor and do all that thou art able, but the seventh day thou shalt holy stone the deck and chip the chain cable."

Now holy stones and other holy things are of some value, but when a poor devil is kept on his knees from the tropics of Capricorn to the tropics of Cancer scouring the deck with sand, stone and water, most sailors are ready to consign them all to the place where ships burn up, and sand, stone and water are hard to find. To such a place the *Cora* was frequently consigned, but with her topsails shivering she continued to weather the promontories of the nether world. Finally we neared the coast of America. I can still hear the sailors sing as they spread the canvas to the wind for the last time:

The REV. E. A. LEMOINE.

"A Yankee ship came down the river,
Blow, boys, blow!
A Yankee ship came down the river,
Blow, my bully boys, blow!

Oh, what d'ye think we had for supper?
Blow, boys, blow!
Oh, what d'ye think we had for supper?
Blow, my bully boys, blow!

Oh, cracker hash and donkey's liver,
Blow, boys, blow!
Oh, cracker hash and donkey's liver,
Blow, my bully boys, blow!"

Then began to crystallize those dreams and thoughts of my boyhood days when I was a fisher lad in Newfoundland. A deep religious experience which had come to me a few years before in Miss Child's "Sailors' Welcome Home," in London, England, determined for me the profession that I should follow.

I had decided upon the ministry. At that time I was twenty-three, with no knowledge of books, except the Bible, Pilgrim's Progress, Robinson Crusoe, and The Swiss Family Robinson, and this last I bought for a five-cent plug of chewing tobacco from a boy who had honorably won it in a Sunday school contest. My difficulties were enhanced by the natural diffidence which the sailor who has spent all his life on the ocean feels in other society. In his own environment of the ship and the water front the old sailor knew no fear, but in the better circles of the avenue he was indeed a fish out of water.

But perhaps it is true that "there is a divinity that shapes our ends, rough-hew them how we will." For in the midst of my perplexity, I was directed to a boarding house on Battery street, Boston, which had the profession, atmosphere and reality of Christianity. The husband and wife were members of the Methodist Church, but most of the sailors were connected with the Salvation Army. It was through this boardinghouse master and a young sailor, who was planning a similar career to mine, that I heard of the school at Mount Hermon, founded by the late D. L. Moody. It was there I entered; it was there the change began which ultimately transformed an old tar into a landlubber, and a sailor into a preacher.

Thereafter my career was similar to that of many other youths who were working their way through school. It is true that they, or most of them, had homes; I had none. They were in a native land; I was a foreigner. They knew the ways of the land; I understood only the customs of the sea. They worked on land during vacation; I sailed the high seas, at times having to stay out more than the summer vacation to earn the next year's expense at school. But my long trips had come to an end. The last few years of my nautical life were spent as quartermaster on yachts out of Boston and New York, the first being the *Hildegarde* of Boston, whose picture still hangs in my study, the last being the *Invader* of New York. This occupation gave me considerable time for study. During the night, while at anchor, as opportunity occurred, I would tie a lantern in the rigging, and dig out some Latin or Greek.

But this page of my life was closed in August, 1907, when I left the *Invader*, and returned to Northwestern University, from which I was graduated in 1908. Later came the General Theological Seminary in New York, and my ordination to the priesthood of the Episcopal Church, and the beginning of ministerial work as a missionary in Utah. I am still doing missionary work.

I wear the biretta and surplice in place of the "sou'-wester" and oilskins; and instead of the marlin spike, I use a fountain pen and a typewriter, while I take a far greater interest in catching men than fish.

I think again of the articles of agreement which as a sailor in the merchant marine I signed: "Shipped for the good of the voyage, the master's interest, boat or shore, night or day." I feel that today I have signed such articles with a glad heart in the Gospel Ship. I have shipped for the good of the voyage, the Master's interest, and I expect to stick until I reach port.

Mr. Ford's Page

"WHAT party does he belong to?" "But nobody knows what party he belongs to!" These questions and exclamations have a familiar sound. The very insistence, almost desperation, with which they are uttered, is significant of partisan emergencies which this country has not seen in seventy years. It means that parties are throwing their last challenge to the people, and putting it on the ground of party alone, because there is no other ground just now to occupy.

"What party do you belong to?" Is that the first question? Hardly. The first question is, "What does the party belong to? Tell me what each party belongs to and I will tell you which party I belong to." To *belong to* anything is to be the property of, at the disposal of, a kind of appendage of that thing, whatever it may be.

So, before announcing oneself as the property of, or as being at the disposal of, or as being an appendage of any party, one should ask, Whose property is the party? At whose disposal is the party? Of what is the party an appendage?

> *WHAT party do you belong to? Very well. Now, what does your party belong to? Do you know? If not you should proceed to discover it at once, for if you belong to a party and that party belongs to someone or something else, then you yourself belong to that undisclosed power that stands in the shadow of the party. It behooves a man to find out what he belongs to—to know whether he really belongs only to his party, or to something further back that controls his party. Party control does not only mean those practiced politicians who see to it that their will and not the party's will is done; party control may mean wills still further back. Whose will is the party doing? Whatever your party may be, you know at least that it is not doing your will, nor the will of plain people like yourself.*

The time has long been here for parties to declare themselves, but they have not done so. Party platforms, which are mere catch-alls for votes, are not declarations. Party platforms have become the colored posters set up to lure the crowds, and each party tries to make its poster more alluring than the other. The only platform any party can have today is its past—whose property it has been, at whose disposal it has been, and of what it has served as an appendage in the past.

And not its *remote* past. Every party has a glorious *remote* past. Every party began in high ideals. Every party had as its founders men who had no ambition but to bring some good into the world. Every party, in its early days, "belonged to," was the property of, at the disposal of, and an appendage of a great idea. But today?—why today one party points to Abraham Lincoln and another to Thomas Jefferson, and either of those men, if living today, would belong to neither of those parties.

The danger, then, of politicians inquiring too closely "To what party do you belong?" is that they will be met with the counter-inquiry, "To what does your party belong?"—and no mere platform, and no mere pointing to names, and no mere flaunting of the honest deeds of non-political honest men of the past, will answer that question.

One clue to the ownership of the parties proves fruitless at once. That is the clue of their differences, their dissimilarities. Find wherein they differ, and then trace the differences back, and you may find to what each party "belongs." But the differences have disappeared as far as principles are concerned. Once the parties differed as between federal and state rights. People usually think that refers to slavery, but it doesn't—it refers fundamentally to town rights and school district rights and county rights, as well as state rights. One group wanted to head everything up in Washington, put all the people's life under strict government control. Another group said, no, "the best government is that which governs least." When that principle was alive, you could tell the difference between the two parties.

But what of it now? Why, now you cannot tell them apart for the dust they both make in racing toward federalism at a mad rate. No leader in either party has had courage to call a halt to the race toward centralized, regimented, Prussianized government control which has made Government the costliest business conducted in this country. Both parties act precisely alike in this matter.

There was a time when one could distinguish between the parties by observing who gave them financial support. One party had all the rich men. The other party had all the poor men. One party ate off golden plate and launched its campaigns amid social splendor. The other party gave "dollar banquets." One party prided itself on owning and disposing the business interests of the country. The other party prided itself on representing the rag-tail and bob-tail of humanity.

But which party, would you say, represents the poor people now? Which party is supported by them? There are still some politicians of the lower ranks deceived on this point, but every investigation brings out the monotonous fact that the principal financial interests that live by privilege are contributors to both parties! This is not to say that a party which accepts money from wealthy concerns is necessarily obligated by that, but it distinctly is to say that *financial interests that live by special privilege* usually figure that they own the parties they support, and nowadays they support both! Thus is another difference swept away.

Then there was formerly one line of division which never failed—the Tariff. That is, it never failed for campaign purposes. It was decidedly useful to have most of the people who were against high tariff in one party, for by keeping them out of mischief by helping them to debate the question eternally, it was very easy to keep a high tariff. That's political strategy—get all your enemies into one party, keep them busy talking, then go ahead and do what you please. This is done by contributing to both parties, for it is possible to make defeats just as profitable as victories to the party leaders.

Where is the tariff now? It is here with us as before, but not in politics. Before, if there was to be a tariff, it must be kept in politics; so by consent of both parties it was kept in politics. But now, if there is to be a tariff, it must be kept out of politics; so by consent of both parties it is kept out of politics. In the last Presidential election nobody said "tariff," but we have a high tariff just the same! It may be right or it may be wrong, the point made here is that it is no longer a distinguishing mark between the parties.

It is so with other matters which formerly were political questions but are now relegated to the field of economics. The principal difference is that formerly the people were encouraged to discuss their economic interests by having those interests made an issue in a political campaign; but when those interests were removed from the political fields and set down safely in the inclosure inhabited by professors of economics, the people stopped discussing them. It is rather startling to think that once upon a time, nay twice and thrice upon a time, the people of this country actually devoted whole campaigns to the discussion of sound money and honest banking. But now, these questions are not any longer in politics. Insofar as they threaten to be in politics, both parties are found to be fostering the same special privilege views. So, once again, differences between the parties are hard to find. And once again the intimation comes that if the ownership of the parties is traced, it will be found to reside at the same source.

That is, if you know what "parties" mean nowadays. The term does not indicate the rank and file of the people who vote for this or that "ticket." The Party nowadays is comprised of the men who make that ticket, and the smaller groups of men above them who ordain what both parties' tickets shall be. The people do not select their *candidates,* they only select their *officials* from the candidates which the super-party powers have selected. Interests that support both parties feel that they have the right to win whichever party loses, and whether they have the right or not, they have it arranged that way. So that the real Party is the group of possible officials who act—in both parties—in harmony with the will of the super-party.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Shall We Go Into the League?

THE League of Nations is a great theme, but the character of the support it is receiving tends to belittle it. The League cannot be exalted by denouncing the United States. When an advocate of the League intimates that the people of the United States feel themselves superior to the rest of the world, and then (contradictorily enough) charges them with being so mistrustful of themselves that they are afraid to sit in conference with other nations, he gives proof in the first place that he knows nothing of the things he ought to know about, and thus throws suspicion on his knowledge of the League. Anyone who can so grossly misjudge his own nation is not the best judge of a League of Nations. He is simply allying himself with those other detractors who charge us with being greedy and cruel-minded, heartless materialists who turn a deaf ear to the cry of a distraught world.

It is truly a pity that the League has fallen into such bad propaganda methods as now mark its discussion in this country. "Do you want your children to grow up in an isolated America?" is one of the cries raised. America is not isolated and never can be. There is a sense in which America might be distinctly shelved by going into the League now. Isolation is a word that has no meaning in this matter. Leverage is always exercised from the outside. "Are you a stay-out or a go-in?" asks *Collier's*. The informed American will probably answer, "Both!" We shall stay out until it becomes right that we should go in. That is precisely the history of our attitude toward the war out of which this League idea came—we staid out until it seemed right to go in. Earlier or later would have been a mistake.

Whether the time has come to go in, only the people can say. Their instinct is right in this matter. But they should be permitted the opportunity of speaking their minds regardless of parties or politics. Nobody knows as a result of the last Presidential election, whether the people meant that we should stay out of the League; the election was not decided on that issue. True, the defeated candidate favored our going into the League, but he would have been just as decisively defeated had he favored our staying out. A solemn referendum, as Mr. Wilson said, free from every other issue, is the only way to learn how the people feel about it, and that referendum can come only upon public demand based on the conviction that the time has come to speak out.

Our people are strongly favorable to the principle of orderly justice in international affairs and the establishment of all possible safeguards to international peace, but in the meantime they are exercising their sovereign privilege of thinking it over. When the United States goes in, it will *go* in, it will not have been *dragged in* by its politicians nor sucked in by the pressure of international intrigue.

First Attack the Home

YEARS ago there was a great deal of talk about "the home." Few people paid any attention to it. Most of the utterances made concerning the home too much resembled preachments to be effective—that is, things said because they were expected to be said. But today we are all in a better position to understand what was meant—we have seen the nations of well-established homes weather the most terrible cataclysms of history, and the homeless nations fall. Each home is a root of the national tree, and the tree holds by the number and strength of its roots.

Sinister confirmation of these truisms has come in the subversive influences which are at work in the as yet unshaken nations. The first attack is made on the home. All of the destructive social movements are sponsored by the people of nations which had more hovels than homes (because they were hovel-making instead of home-making peoples), and it is significant that in this country the work of destruction is taken up by those who prefer transient habitations to homes. The home, like the church, is under fire because it presents a bulwark against the subversive forces of the world. By cheapening the marriage tie, by undermining parental authority, by inculcating an artificial spirit of worldly wiseness in the young, by all the processes of divorce, entertainment, bad literature and the general trivializing of our common life, the doors have been opened to other and more degenerative influences in the general social life.

It is a matter of common observation over a long period that the social fabric begins to rot with the weakening of the home. The best defense of law and order and progressive justice is the success of those elements which defend and strengthen the home. We could well afford in this country for the next decade to regulate all our industry and politics and finance with one single paramount object in mind. the welfare of the home.

Nothing is more useless than platitudes on this subject. Attend first to the welfare of the home, put a sound economic condition around all its spiritual elements, and upon our economic consideration we shall find the other elements growing to unparalleled strength. As long as the American home stands, this nation never will succumb to the poisonous airs with which satanic forces are now filling the world.

Lloyd George Goes Home

A TRIP to America seems to be part of the political obsequies of European statesmen. Their proper measure is taken only when they stand against the background of America. The advantages of their coming are wholly with us, because it confirms the instinctive judgment of our people that the trouble with Europe is its statesmen.

English papers are agreed that Lloyd George's trip to America was taken as a publicity stunt to raise him again in British esteem. Apparently it was hoped that his blandishments would prove so irresistible that our answering smile would stretch across the sea and make the people of the British Isles ashamed of themselves for turning down such a nice little man. He came, and his blandishments were a little too thick. We received him pleasantly, for he has done nothing to us—we did not entangle ourselves in the crooked Versailles Treaty. But it was impossible to forget his political footwork and his habit of blarney. He is still the same man who promised to hang the kaiser and make Germany pay the last cent; he promised anything at any time, to be agreeable to the prejudices of the moment. He is also the same man who encouraged Greece to go up against Turkey, and abandoned her. He is the man who has reversed himself for political reasons oftener than any politician alive; and retribution has just naturally overtaken him. Fate will not forget her duty under the magic of his smile.

Mr. Lloyd George discovered one thing on his tour, namely, that he is not considered as having been or as being one of the "inside statesmen of Britain," as Gladstone was, and his successors were. He is not of that class which in office or out of office represents the British mind. He was not able to make his way into the real heart of the British Government. He was a useful instrument of that government, but never the will of the government itself. He was a war premier with certain great temperamental gifts, serviceable in a certain period. That will account somewhat for the character of the attention given to him here. The only remark which attracted anything like a national hearing was his approval of the Hughes plan, which to say the least was not original, and which certainly is contradictory to the policy on which Lloyd George won the last election before his defeat. Public interest in anything else he had to say dwindled steadily to the day of his departure.

It is a strange fact that the visitors who have stood best the ordeal of America are the great soldier chieftains. The reason is not far to seek; the soldiers did their work, and when their work was done they stopped. Statesmen, whose work is done, still have the weakness of harboring a hankering after office.

The Editor's Plight

EDITORS of church papers which tell the truth about economic matters have a hard time of it. Rev. Dr. Edgar L. Killam became editor of *The Baptist,* and immediately put that paper on the journalistic map. He carried a column of familiar chat with his readers, in which he gave the Christian reaction to our present system of false economics. There is no heterodoxy more hateful in a minister than economic heterodoxy.

Many outside the clientele of *The Baptist* will learn with regret that the personality which Dr. Killam has injected into the publication is hereafter to be submerged, if not suppressed. No one can say what insidious influence has been at work, but it seems certain that the "relief" offered to Dr. Killam was not asked for—by him. It would be regrettable if church officials are following the course of letting men down easy with false excuses.

Dr. Killam, whose column was called "Killam's Kollum," writes in his last issue as follows:

"We are not yet quite sure as to the fate of this Kollum. From things gathered at a recent conference it would seem that its life is near its close. If it crumbles to dust it will not be due to any malice on the part of the committee or the new editor, but solely to relieve the present editor of the physical, intellectual and spiritual strain of writing this page! Incidentally, it may also relieve the strain upon the sensibilities of some of the readers."

Dr. Killam opened his reference to the change under a sub-heading, "The Editor's Life Saved Again," thus:

"How? Read the announcement of the committee on *The Baptist* in this issue. We are human enough to like to hear nice things said about us, but we have sense enough to distinguish between *a reason* and *an occasion.*"

But he seems to put his finger directly on the spot, in this language:

"The readers will not miss the Kollum as much as the editor will. He will feel a strange sense of loss. Here has been THE ONE PLACE where he has felt perfectly *free to tell the truth.*

Perhaps, in such instances, may be found an answer to the question why young men no longer enter the ministry. Either the present economic system is Christian or it is unchristian. But for a minister to say it is unchristian is to court displeasure and dismissal by those who profit by the system.

Why Not Control Here, Too?

THE proposal is now openly made that the government destroy independent banking by forcing all banks into the Federal Reserve System and assuming control as a government function.

Secretary of the Treasury Mellon has voiced it in an address advocating a law to this effect. Two officers of the National Credit Men's Association have testified that it is necessary for business that only banks under government control should be allowed to function and that Congress should drive every bank in the country into the Federal Reserve System or out of business. The government control feature is generally conceded. But what about government control of the Federal Reserve System? Federal Reserve Banks are only nominally under government control. They are private institutions. In all matters of business, their relations with the public and with other banks, they are free to act as they wish except as the Federal Reserve Board holds power to punish any Federal Reserve Bank which may consider its duty to the public paramount.

Why does not some courageous and enterprising statesman come out for government control of the Federal Reserve System?

"Wet Agents" Won't—That's All

THE point of the prohibition emergency is here: the law is being "enforced" by men who don't believe in enforcing it. In other words, the majority of the "dry agents" are "wet men." This condition obtains in every state. All the scandals grow out of it. Sometimes the "dry agents" have been used as a special police to protect the bootlegging traffic of one big owner of liquor against the encroachment of smaller bootleggers. Sometimes honest dry agents have stumbled on to the tricks and evasions and violations of the big owner, and have been transferred or discharged for their pains. If the public mind were not already saturated with tales of malfeasance in office high and low, such a flood of information on the above points could be poured out as would shake even the government at Washington.

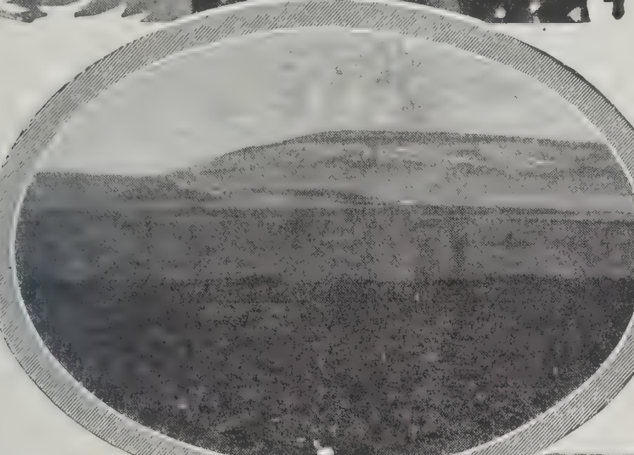
The situation is not complicated at all. Dry men will enforce the dry laws, and wet men will not. The tip is free to Secretary Mellon and to all the Governors. With regard to Cabinet responsibility in this matter, the tip is free to President Coolidge also.

What Does Future Hold for Palestine?

Water Power of the Jordan May Open Up Industrial Possibilities for Holy Land

By the REV. C. W. M. CASKILL

Above—A view on the Sea of Galilee.



Oval—The plain of Jezreel is only partly cultivated.

At right—The one-time rich Jericho plain, now a barren waste.

WHEN the Israelitish spies returned from spying out the land of Canaan they brought back a "goodly report." They said it was rich, a land flowing with milk and honey, and as evidence they brought with them some huge bunches of grapes, so large that two men were required to carry one of the clusters. Were they to go into Palestine today they would bring back quite a different report.

Two things impressed us as we went through this interesting country. The first was the desolation everywhere. Palestine is a land of hills, and these hills today are almost completely denuded of vegetation. There are no forests. There are very few fruit trees or vineyards except in the valleys. Even olive trees are rare on these hills. No fields of grain, no gardens, and on many hardly grass enough for sheep or goats to graze. They appear like rounded knolls of rocks and stones, and almost desert-like as to productivity. Even the plains are only partially cultivated. We saw many, many acres out on the plains of Esdraelon and Jezreel and Geneseret that looked as though they had not been cultivated for ages. The rich Jordan valley below Jericho looked like a desert, covered over with scrub bushes somewhat resembling our sagebrush. In places it is possible to look in every direction for miles and not see a house or a shack of any kind, unless it be here and there a Bedouin tent. The native villages are made of crude mud shacks with no modern conveniences. Thousands of the people never sit down to a table to eat, and their only stove for baking is a mud oven where the bread is placed and covered over with hot ashes, then a smouldering fire is made from dung, or else a small mud concern large enough to hold a kettle. Their only bed is the floor on which they place their blankets. Throughout the country districts and in the smaller villages we did not see a single schoolhouse anywhere. There were no factories even in the large cities, with the possible exception of a few small ones, if they could be called factories, in Jerusalem, Jaffa and Haifa. Aside from the few main roads that have largely been built since the English occupation, there are no roads in Palestine. There are just bypaths over which donkeys and camels can pick their way but over which not even a two-wheeled cart could possibly pass. They are narrow and rocky, and no effort has been made to improve their condition. A native woman said of one almost impassably rocky road that probably not a single stone had been removed from it within two thousand years, and possibly not since the days of David, and this notwithstanding the fact that this road has been in constant use all that time. The desolation and neglect everywhere were almost oppressive at times.

On the other hand, we were still more deeply impressed with the seeming possibilities and opportunities that loomed about us on every side. I was brought up on a farm so the first thing that struck me was the farming and gardening possibilities of this country. No richer or more productive land can be found on the face of the earth than that in Palestine. The great plain of Esdraelon, and the plain of Jezreel, the valleys and plains about the Sea of Galilee, the plain of Seleh, the rich Jordan valley, Philistia, and Sharon and Ephraim, and the grazing country of Gilead are rich to a proverb. With plenty of water and with modern methods of farming, these plains can be made as productive as any part of the Nile Valley. And in this climate what cannot be raised? Almost anything in the way of fruits and vegetables and grains that can be raised in any land can be raised here. In the lower Jordan valley and on the southern plains tropical fruits and plants grow luxuriously; on the higher hills and table-lands, the products of the more northern countries.

True, most of Palestine is comprised of hills, and these are now denuded and desert-like. But that does not mean that they are incapable of rich productivity. The rocks that cover them are, or may become, the source of their fertility. Constantly decomposing, they are forming soil, and the very elements needed for rich productivity are in this rock soil. Let these hills be terraced, as most of them once were, and the desert aspect will disappear and the hills will once again be covered with rich olive orchards, with date palms and pomegranates, with figs and oranges, and with the most productive vineyards. Vegetation will invite more moisture, and more moisture will increase vegetation.

Much of this land that is now barren or only partially productive on account of insufficient moisture is capable of irrigation. The Jordan River, if properly dammed, would furnish water for much of it. Dams could be constructed without exorbitant cost in many of the higher valleys. During the rainy season there is an abundance, in fact at times an excessive rainfall, five or six inches within twenty-four hours. The pools would be filled during this season, and properly piped would furnish water for irrigating thousands upon thousands of acres during the dry months of the summer. A visit to the Etam and Artas valleys below the Pools of Solomon would convince anyone of what might be accomplished along this line. The Jews in their various colonies are demonstrating the rich farming possibilities of this land. Within a few years they have literally transformed desert or almost desert tracts into veritable Gardens of Eden. One of the finest agricultural demonstration farms in the world is not far from Jaffa, and we were told that almost every plant and tree and vegetable grown anywhere had been grown on this farm. They are making a special study of the soil in reference to different crops for different sections of Palestine, and no doubt will soon be able to make suggestions that will wonderfully help to transform the agricultural life of this whole country.

Just what mineral possibilities there are in Palestine is as yet unknown. The Standard Oil Company, before the war, obtained oil concessions from the Turkish Government for the district south of the Dead Sea, and has since then obtained a like permit for the whole of Southern Palestine. Many oil experts have expressed the opinion that oil will be found in this region, and the fact that the Standard Oil Company has obtained this permit, has spent large sums and is continuing to spend money on its experiments, is pretty good reason to believe that oil exists here. I was told by a leading business man of Jerusalem that recently a noted mineralogist had discovered that the rocks on some of the hills contain a large per cent of iron, sufficiently large to make them of unquestionable mining value. Silicate of the very best quality for building material is here in great abundance. In our trip around the Dead Sea we visited Salt Mountain and went into the salt cave. This is in reality as well as in name a mountain of salt, being almost pure crystal salt. Breaking off the outer crust of some of the huge blocks that had fallen from the mountain side we found them to be of as pure and clear crystal salt as one could find anywhere. What this mountain would be worth commercially is beyond one's imagination. Farther up the shore we saw great mounds of what seemed to be almost pure potash. Along the sandy bank we found pieces of asphalt or bitumen, and we were told by Dr. Albright, head of the American School of Archeology, that the whole southern end of the Dead Sea is probably underlaid with bitumen. Years ago, after an earthquake or a severe storm, great quantities of this would break loose and come to the surface. It was gathered by natives and sold at large profit. This is undoubtedly what the Old Testament speaks of as the "slime pits" or "tar pits" that were in the neighborhood of Sodom, some four thousand years ago. What commercial treasures may be hidden here we can now only imagine. Some day a live, progressive man will know and may become rich for his knowledge.

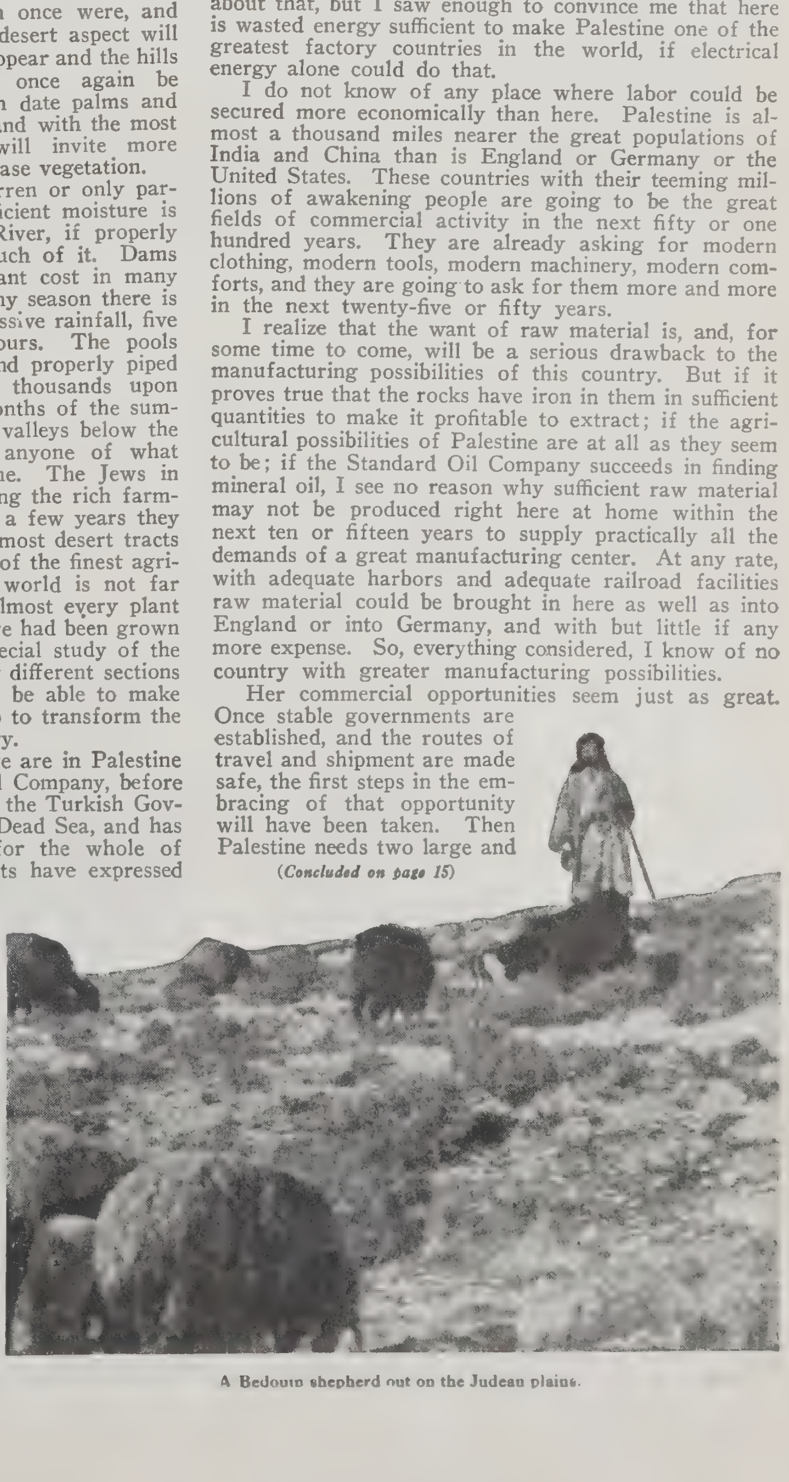
As I said before, there are practically no factories in Palestine. Yet why should there not be? True, she has no coal and no mineral and but little raw material, things absolutely necessary for the development of a manufacturing community. But she has the Jordan River. Its headwaters are approximately one thousand seven hundred feet above Lake Huleh, which is about sea level. The Sea of Galilee is six hundred eighty-two feet below Huleh, and the lower Jordan and the Dead Sea one thousand three hundred feet below the Sea of Galilee. No other river in the world, capable of being harnessed and used, has such a volume of water with such an unusual fall. Some one has said that here is waterfall enough to furnish electric energy sufficient to run all the machinery of the world. I do not know about that, but I saw enough to convince me that here is wasted energy sufficient to make Palestine one of the greatest factory countries in the world, if electrical energy alone could do that.

I do not know of any place where labor could be secured more economically than here. Palestine is almost a thousand miles nearer the great populations of India and China than is England or Germany or the United States. These countries with their teeming millions of awakening people are going to be the great fields of commercial activity in the next fifty or one hundred years. They are already asking for modern clothing, modern tools, modern machinery, modern comforts, and they are going to ask for them more and more in the next twenty-five or fifty years.

I realize that the want of raw material is, and, for some time to come, will be a serious drawback to the manufacturing possibilities of this country. But if it proves true that the rocks have iron in them in sufficient quantities to make it profitable to extract; if the agricultural possibilities of Palestine are at all as they seem to be; if the Standard Oil Company succeeds in finding mineral oil, I see no reason why sufficient raw material may not be produced right here at home within the next ten or fifteen years to supply practically all the demands of a great manufacturing center. At any rate, with adequate harbors and adequate railroad facilities raw material could be brought in here as well as into England or into Germany, and with but little if any more expense. So, everything considered, I know of no country with greater manufacturing possibilities.

Her commercial opportunities seem just as great. Once stable governments are established, and the routes of travel and shipment are made safe, the first steps in the embracing of that opportunity will have been taken. Then Palestine needs two large and

(*Concluded on page 15*)



A Bedouin shepherd out on the Judean plains.

Commercializing the Gangsters of the Ghetto

Certain Type of Business Men Hire Gunmen for Trade Killings

By CHARLES ALBERT COLLMAN

SINCE the early eighties, New York's East Side has been noted as the breeding place and habitat of gangsters. But for a generation, these consisted merely of groups of young roughs who created sporadic disorders in their fights with the police. It was not until the beginning of the great influx of immigrants from Russia and Poland, that there came into being the organized Jewish gangs, whose growth and spread has developed a new era in crime in the metropolis.

The gang wars raging at present in New York, punctuated by bold assassinations of heads of rival "strong arm" groups, in front of courthouses and in the business districts of Broadway, have brought to recognition the fact that these organized bands of criminals are supported and employed by business men and Bolshevik labor unions, in their periodical battles for supremacy.

The gradual monopolies obtained by a certain element in New York are by no means due to superior business ability, but are the result of a deliberate system of terrorization. The criminal annals of the city prove this to be true in the poultry, laundry and clothing industries, and to a great extent in the fur and silk business.

Groups of Jewish "bad men" have flourished on the East Side for a generation, the more notorious being the "Kid Twist," the "Monk" Eastman and the "Big Jack" Selig gangs. Kid Twist was a killer, and he and his men were used as intimidators by low-type politicians until the day when Twist was shot to death in front of a Coney Island dance hall. Monk Eastman once ruled over the river section of the lower East Side, until he was driven westward to the Bowery and Chinatown, where his gang for a period numbered 1,000 members. He served several prison sentences for crimes of a cowardly nature and was shot dead one night in 1920, while plying the bootlegging trade. Big Jack Selig, leader of a band of Yiddish pickpockets, was a sinister figure on the lower East Side during 1915-1916. In wars with the Jack Sirocco gang, which operated farther north, three gambling houses were bombed and Chinatown was shot up more effectively than in any battle of the Tongs.

First Hired by Gamblers

AT FIRST these gunmen were hired by gamblers, this practice culminating in a sensational murder, when a pack of cocaine-crazed Yiddish youths, in the pay of a rival coterie of gamesters, rode up to the theatrical district in a motor car one night, and shot down the gambler, Rosenthal.

But the value of gunmen was soon realized and adopted as a commercial asset by business men. In the dressed poultry trade, in which the race had gained a monopoly, competition brought as a climax the Barnet Baff murder, in which Baff's trade rivals, who had accused him of underselling them by filling the crops of his fowl with gravel, hired gangsters to assassinate him as the poultry dealer came out of his market place. Next, when the race had obtained control of the laundry business in New York, competitive groups began to engage gangsters to set fire to one another's laundries. Several of these criminals were arrested some months ago, charged with having set fires to wet wash laundries in more than twenty tenement houses. Then clothing contractors, in the periodical strikes of their Bolshevist workmen, employed "strong arm" men to cow their employes, and their example was immediately followed by the red organizations, with the inevitable consequence of criminal assaults in countless numbers during the semi-annual clothing strikes that visit New York.

Today, according to the District Attorney's Office, the hiring of gunmen has become a habitual practice among a certain type of men in business. District Attorney Banton only recently announced that the circumstances attending the slaying of a notorious East Side gang leader had caused him to begin an investigation of the conduct of union officials and employers in connection with strikes. It was his intention, he said, to enlist the police in a real drive against all gunmen "who think that they can get away with shooting up New York streets."

"Gunmen," said Mr. Banton, "have got to get out of New York, and to force them to do it, we will have a special part of the Court of General Sessions set aside to try nothing but 'crimes of violence' for the next month. We will give the gunmen, holdup men and other rough gentry the same kind of treatment accorded them last year when they tried to take the bit in their teeth.

"Another thing that I would like to do would be to get the employers of these gunmen—the fellows who hire the gun-toters to 'do up' their adversaries. Such thugs are for hire. I want to connect up the men who engage gangsters, and I shall prosecute them and put them behind prison bars. It is a common practice, it seems, when trouble breaks out between employers and unions, for somebody on one side or the other to employ gunmen."

Mr. Banton's statement was occasioned by the murderous developments resulting from a long-standing feud between two Jewish groups, the "Kid Dropper" and the "Little Augie" gangs. These organizations, according to the police, were headed by two tried criminals, Nathan Kaplan, alias "Kid Dropper" and Jacob Orgen, alias "Little Augie." The feud, which was marked by heavy casualties in a struggle for the supremacy of the East Side underworld, had its economic as well as its belligerent aspect, since the tribute obtained from employers and "outlaw" unions, to whom the gangs furnished "strong arm" men in labor disputes, and the toll exacted from small merchants on whom the gangsters preyed, amounted to an appreciable sum annually.

Nathan Kaplan, whose finish will be detailed subsequently, was held to have been responsible for at least fifteen killings on Manhattan Island. For nearly fifteen years he blackmailed East Side merchants who themselves were engaged in illegal pursuits. He obtained the sobriquet of "Kid Dropper" when, as a young messenger in Wall Street, he knocked out those who went counter to his wishes. He first broke into print as a gangster in 1909, when he began to rob and terrorize small business men.

Kaplan's criminal pedigree is typical of the records of the numerous Yiddish criminals who infest New York City. It also illustrates the leniency which judges of their own race display toward such birds of prey. Arrested in 1908 as a general thief, Kaplan was discharged. Charged in 1909 with carrying concealed weapons, he received a suspended sentence. He was discharged also in 1911, when arrested for assault and robbery. Later in the same year, when convicted of robbery, he was sentenced to serve ten years in Sing Sing. In 1919, he was once more discharged after having been arrested for felonious assault. Arrested later that year, charged with homicide, no disposition was made in his case. In 1920, he was sent to Blackwell's Island for carrying a revolver. A few months later, he was once more sent to the island for robbery. Arrested in 1922, on a Federal charge of conspiracy, no disposition was made of his case. Several months afterward, apprehended for felonious assault, he was again discharged. Early in 1923, he was arrested for burglary, and released on bail. Later he was discharged once more after having been arrested for felonious assault.

In a personal quarrel between the two gang leaders, Kaplan had slashed "Little Augie" across the face, branding his antagonist with a deep scar. Afterward, Orgen, or Augie, fired four shots at Kaplan, two of them hitting the latter's legs. Then the bitter enmity between the two groups was suddenly intensified by the activity of Kaplan in cutting in on the revenues of the "Little Augie" fraternity. The "Dropper" had previously limited his strong-arm services to contractors who wanted to "quiet" striking employes. "Little Augie" had built up an extensive clientele of a similar character among the Bolshevik unions. Kaplan made a bid for the latter's trade, and succeeded in winning away some of "Little Augie's" patrons. Now ensued a series of savage encounters between the gangs, who were emboldened by a growing confidence in the mysterious protection which they had always enjoyed.

On August 1, a revolver fight occurred between the "Little Augie" and the "Kid Dropper" factions. Jacob Shapiro and another man were shot, and this result spurred on the leaders of the "Little Augie" group to order the assassination of the "Dropper." The details of their plot were afterward brought to light through underworld accounts, supplemented by testimony developed by the District Attorney and the police.

At a conference of members of the "Little Augie" band, it was decided to "get" Kaplan. All were eager to get him out of the way, but none volunteered to do the killing, for it was known that the "Dropper" never traveled without his personal guard of sharpshooters. *Courage is not a normal quality of the East Side gunman, who merely nerves himself up to the commission of a homicidal crime by the liberal use of narcotics.*

At this juncture, a gangster suggested the use of one Louis Cohen. Cohen, an emaciated youth, who is a wet wash laundry worker, had aspired to be a gangster, but the members of the "Little Augie" gang, to whom he attached himself, looked upon him with more or less contempt, and utilized him as a "water boy"—one who does errands for the gunmen.

Promised Gang Protection

ACCORDING to the police, Cohen was thereupon brought into the scheme, his weak imagination excited by a glowing picture of the important position he would assume in gangdom if he succeeded in removing the "king." He was promised the protection of the gang if he succeeded in killing the "Dropper" and that even if he were "sent up the river," influences would be used to obtain his release from prison. Cohen, who had often complained that he had been hounded by the "Dropper," agreed to become the executioner of the gang leader.

While the plan of assassination was being arranged, the "Little Augie" faction gained an opportunity to strike an underhand blow at their rivals. Fourteen members of the "Kid Dropper" gang assembled one morning in a Broadway office building on a secret mission. The "Little Augies," knowing of this appointment, tipped off the police that the "Dropper's" gang had assembled to receive instructions for some strong-arm work. The police raided the office and arrested the men, among whom were Hyman Kaplan, a brother of the "Dropper," "Dave" Rothman and other partisans. They were held on the charge of violating the Sullivan law.

On the morning of August 28, a crowd of more than 2,000 persons had gathered in the streets surrounding the Essex Market Court House in the lower East Side of New York City. Persons unfamiliar with the life of the Great Ghetto, can scarcely realize the swarming of the semi-criminal hordes there to the scene of any excitement that appeals to their emotions. It will be remembered that on August 1, during a revolver battle between the rival factions, one Jacob Shapiro had been shot. Shapiro had identified "Kid Dropper" as one of three men who had fired at him at that time from an automobile. Nathan Kaplan, and fifteen of his confederates, had been taken to the Essex Market Court House on this morning. Kaplan, alias the "Kid," to answer to a charge of felonious assault, the others being charged with knowledge of the same crime.

Police Captain Willemse, having been forewarned that the opposing gunmen would be on hand, "ready for trouble," when the "Dropper" was taken to court, had thrown a cordon of fifteen detectives and ten uniformed patrolmen around the neighborhood of the court at Second avenue and Second street.

The "Kid" was arraigned before the magistrate, and Shapiro, his accuser, was brought forward to confront him. Previously, to the police, Shapiro had been positive that Kaplan was the man who shot him. Now, under the eyes of the gang leader, in a courtroom packed with the latter's sympathizers, the accuser's courage oozed away, and uncertainly, with shifting gaze, he professed that he had been mistaken in identifying Kaplan.

The magistrate immediately released "Kid Dropper," who was, however, taken in custody again by the police, to face another charge in the West Side Court. With a detective sergeant at his side, and Captain Willemse behind him, the leader of gunmen emerged from the courthouse. Parked at the Second street curb was a taxicab with its engine running, prepared to take the prisoner uptown. A group of detectives who had been on emergency duty in the court room, now filed out into the street. The police closely watched the crowd, which had been driven away from the vicinity of the taxicab.

The "Dropper," smiling with assurance, walked leisurely to the cab, the door of which was being held open to receive him. The gangster's wife rushed up and flung her arms about his neck. "Jack," she cried, "you've beaten the case, and you'll beat the one uptown."

Cohen Bravado Soon Fades

WHILE the police motioned the woman aside, Kaplan entered the vehicle, followed by one of the detectives. A stunted, emaciated man, who had worked his way unobserved through the police lines, approached the cab on a run. It was Louis Cohen, the "water boy" of the "Little Augies," under the stimulus of cocaine, making good his agreement to the gang.

Unable to see Kaplan, but standing on tiptoe, Cohen snatched a revolver from his pocket and fired three shots downward as best he could, through the rear window of the cab. The first shot hit the "Kid" in the back of the head, the second struck the chauffeur, and the third passed through the straw hat of the police captain.

The gangster's wife, yelling, grappled with Cohen, and clawed his face. The youth threw her to one side, and knocking away an obstructing piece of glass in the shattered cab window opening, he sent another bullet through the "Dropper's" head.

Kaplan, mortally wounded, collapsed on the seat, while the police, surrounding Cohen, hustled him back into the court room to shield him from the wildly surging crowd.

Just before this shooting occurred, the police had received word that seven armed men were congregating at the Bowery and Fourth street. Learning from a "lookout" that their presence had been detected, the gangsters scattered, but detectives captured three men near the courthouse, all with revolvers in their pockets. They were Jacob Orgen, alias "Little Augie," and two of his followers, named Weiss and Gepson.

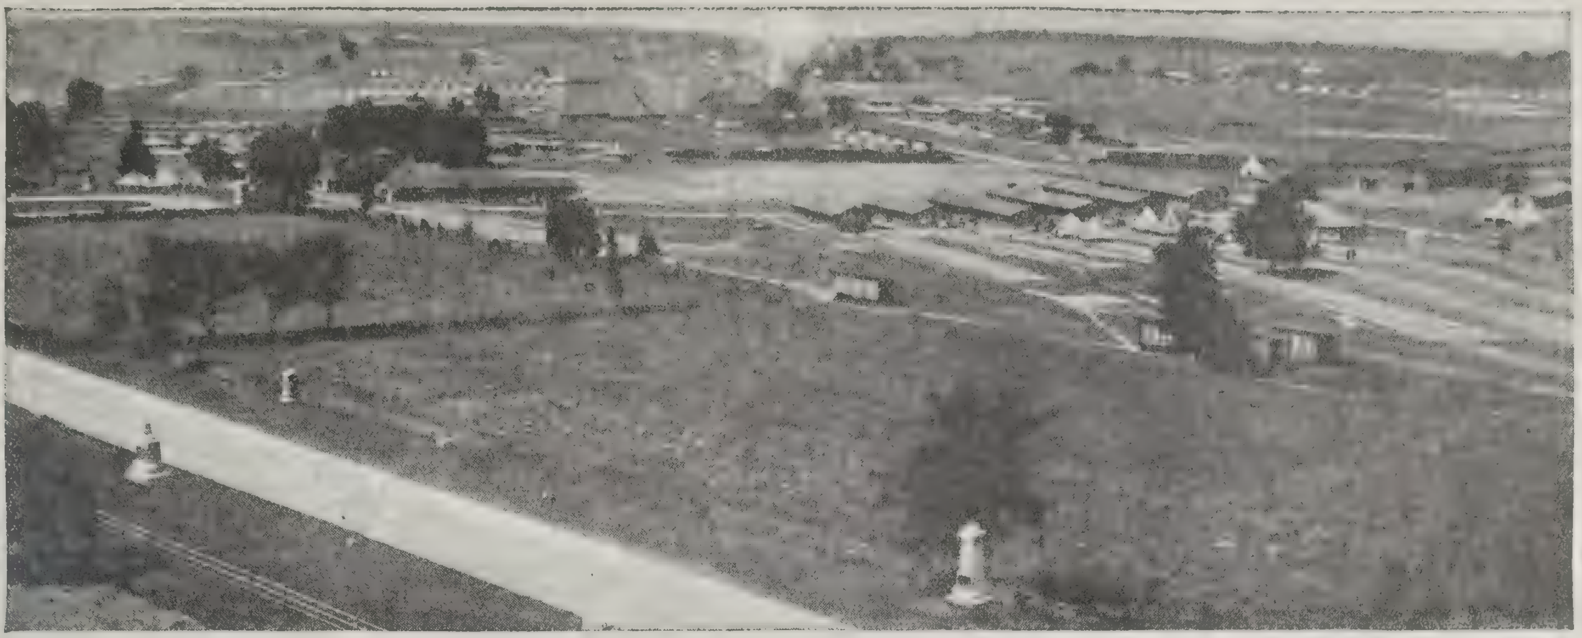
Two days later, a morbid, emotional Yiddish throng of some 3,000 persons, surrounded an East Side undertaking establishment, in which the Rev. G. Grossman, an unattached rabbi, was reading the burial service over the body of the murdered gunman. The mob had congregated in the neighborhood for several hours, drawn by a rumor that members of the "Little Augie" band, who had plotted the slaying, had arranged to have a jazz band on the fire escape of a neighboring tenement, to send the "Dropper" to his grave to the strains of derisive melody.

Gangsters were alighting from taxicabs and private motor cars in the immediate vicinity, with the evident purpose of disrupting the funeral party if not to engage in another pistol battle with their antagonists. With this end in view, the "Little Augies" sent in a false fire alarm from the corner, but when the fire apparatus came thundering through the street, emergency police and detectives came to the aid of a uniformed squad in keeping the police line about the hearse intact. Amid the loud lamentations of the gangster's widow and other members of his family, including his seven brothers, the body of the "Dropper" was carried to the hearse. An escort of detectives followed it in an automobile, and when the funeral party reached Queensborough Bridge, a detachment of motorcycle policemen fell in on both sides of the hearse, which carried the gunman's body to the cemetery without further interruption.

Cohen, the assassin, his bravado swiftly vanished, was indicted for first-degree murder. "Little Augie" was sent back to the penitentiary to serve out twenty-three months of an unexpired term, for having broken his parole. Others of the gangsters were similarly returned to prison, "Dave" Rothman to serve eight years in Sing Sing on an unexpired holdup sentence, and "Dave" Fertel to Elmira Reformatory, from which he had violated a recent parole.

Only a few months before this, Benjamin Levinsky, a Yiddish youth who had spent a considerable part of the last twenty years in reformatories and penitentiaries, was similarly shot and killed on Broadway. Such are the crimes and scenes which make up a great part of the ordinary life of the ghettos of New York.

Fresh thousands of immigrants from the troubled centers of Eastern Europe arrive monthly to add to the populous overflow and increase the dangerous and turbulent elements that are insidiously penetrating American life.



A general view of the Gettysburg battlefield.

When Lincoln Spoke at Dedication of Gettysburg

Address Really an Answer to Invitation of the Patriot David Wills

By JOHN D. ANDERSON

THE mightiest conflict ever waged in the western world took place on July first, second, third and fourth, 1863. It is known in history and to all civilized mankind as the Battle of Gettysburg.

With the failure of General Robert E. Lee to accomplish his objectives—to capture Harrisburg and Baltimore—he became anxious to reach the south side of the Potomac River. In this course, as he then believed, lay his only road to safety. With the victorious General George G. Meade and his whole army in pursuit, the burial of the several thousand dead left on the battlefield at Gettysburg and the care of the wounded became a matter of patriotic and humane duty.

Just before the battle, Governor Andrew G. Curtin had called for a volunteer home-guard army of sixty thousand, and this call had met with a prompt response. To this civilian force and to the local authorities was assigned this laborious task.

The supervision of the whole undertaking was intrusted to David Wills, a young attorney of Gettysburg and then but thirty-two years of age. Once the most urgent things had been done it was in his mind that the final resting place of these soldier-dead should be made a permanent cemetery—a mausoleum to which their remains should be brought together and properly buried.

Soldiers from eighteen states had fallen here. This gave to the battle ground a national character. It was therefore apparent that whatever form the ceremonies took to mark the occasion of this dedication they should assume a nation-wide interest, be nation-wide in character and likewise nation-wide in their solemnity.

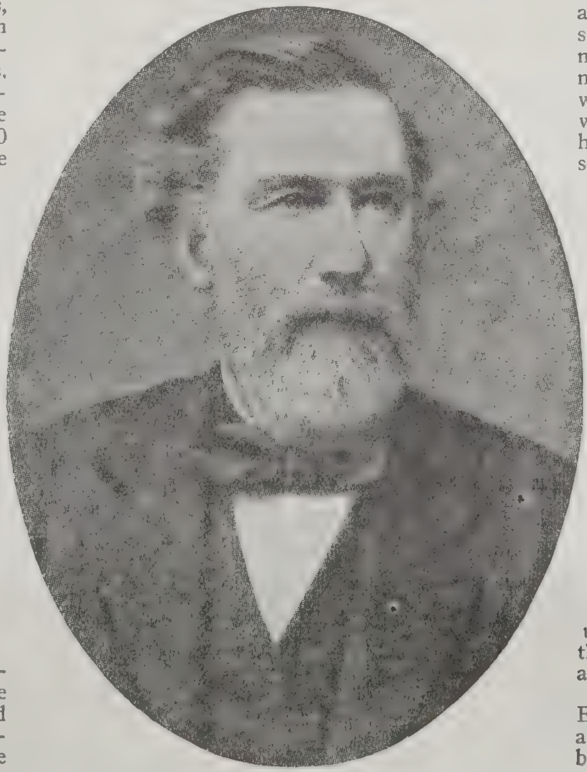
Let us ask: Who was this man, David Wills, into whose hands Governor Curtin had given such a large undertaking? What had he done to inspire such confidence? His ancestor, David Wills, who could trace his ancestry back to Carrickfergus, Ireland, and to the year 1578, was the first to emigrate to America. He arrived in 1730 and settled on a farm in Chester County in the colony of Pennsylvania. He reared three sons. David Wills, Jr., was the eldest. This David Wills in 1750 left Chester County, pushed westward and settled on a farm in Cumberland County. He in turn raised three sons. James was the eldest, and his son James Jack was the father of the David Wills we find at Gettysburg. James Jack was born in Cumberland County in 1802. His wife, Ruth Wilson, was a native of Adams County, in which Gettysburg is situated. Her father, George Wilson, was a farmer and merchant of Menallen Township, whose ancestors had come from County Tyrone, Ireland, about the time that the Wills ancestor had found his way to America. David Wills was born in 1831. His mother died four years later. His father had so prospered as a farmer that when David was thirteen years old the father had retired from the farm, that his children might obtain a better education. The family made its home in Gettysburg.

In due course, David Wills was sent to Pennsylvania College and was graduated in 1851. He had shown an especial aptitude for teaching and some talent for public speaking. Upon his graduation he went to Cahaba, Alabama, and became principal of the academy there. At the end of the first year, he returned to Pennsylvania and entered the office of "Thad" Stevens, at Lancaster, as a law student. Wills was admitted to practice in 1854 and opened an office in Gettysburg. He served several terms as burgess of that borough and as president of the town council, and councilman and attorney. The same year that he was admitted to practice law he was elected county superintendent of schools of Adams County. For many years he was president of the old Baltimore and Cumberland Valley Railroad and attorney for the Gettysburg, Hanover and Baltimore Railroad systems.

In 1874 he was elevated to the position of presiding judge of the Forty-Second Judicial District of Pennsylvania, which position he filled with dignity. He organized and carried to completion the Gettysburg National Cemetery from which grew the plans for the battlefield cemeteries of the entire country.

Judge Wills was of a deeply religious nature and was connected with the Presbyterian Church and its Sunday school as superintendent. He was frequently a delegate to the Presbytery of Carlisle and also as a commissioner to the General Assembly of the Presbyterian Church of the United States.

As early as July 24, 1863—only nineteen days after Lee's retreat—David Wills wrote to Governor Curtin and submitted his general outline plan for the cemetery. This met with executive approval and Wills at once entered into correspondence with the governors of the states whose soldiers had engaged in battle there.



DAVID WILLS

A little less than a month later Governor Curtin received another letter in which Wills stated: "I have invited the co-operation of the several states having soldier-dead on the battlefield around this place, in the noble project of removing their remains from their present exposed and imperfectly buried condition on the fields for miles around, to a cemetery."

Fifteen of the governors had, up to that time, responded and pledged co-operation. He had purchased for $2,475.87 and taken title in the name of Pennsylvania to a tract of about seventeen acres. This was on Cemetery Hill, fronting on the Baltimore turnpike and extending to the Taneytown road. It will be remembered that this land had formed the apex of the triangular line of battle and the very key to the Union line of defenses. Wills declared: "It embraces the highest point on Cemetery Hill and overlooks the whole battlefield. It is the spot which should be specially consecrated to this sacred purpose. It was here that such immense quantities of our artillery were massed, and during Thursday and Friday of the battle from this most important point on the field, dealt out death and destruction to the rebel army in every direction of their advance."

Governor Curtin quickly replied. He expressed his satisfaction with the details of Wills' plans, and requested that every consideration be given to any plans the other states might suggest. "Pennsylvania will be highly honored," he wrote, "by the possession within her limits of this Soldier's mausoleum, and so much distinguished among other states by their contribution in aid of so glorious a monument to patriotism and humanity, that it becomes her duty, as it is her melancholy pleasure, to yield in every reasonable way to the wishes and suggestions of the states which join with her in dedicating a portion of her territory to the solemn uses of a national sepulcher."

Many schemes for the burials were suggested. Wills strongly urged that the interments should not be by states, but promiscuously. The joint special committee of the city of Boston, which had from the time the plan was suggested given its most cordial support, persistently and strenuously advocated the plan of separate state lots. Wills conceded and the Boston committee's plan was followed.

William Saunders was the gardener selected to plot and lay out the grounds. He made a semicircular arrangement of the lots. The states represented were New York, Pennsylvania, Illinois, Virginia, Delaware, Rhode Island, New Hampshire, Vermont, New Jersey, Wisconsin, Connecticut, Minnesota, Maryland, Maine, Michigan, Massachusetts, Ohio and Indiana. Space was provided for United States regulars as well as for unknown dead. The general plan followed was the laying off in sections with a space four feet as a walk between each section.

On September 24 Wills addressed a letter to Edward Everett, asking him to make the principal address. Mr. Everett accepted but said it would be out of his power to make the preparation by

Fleischhackers Take an Interest in Shipping

Lasker Works to Give Western Bankers Control of Pacific Boats

By a Washingtonian

This is the third of several articles having to do with conditions in the United States Shipping Board. Another will appear in an early issue.

THE shadow of the House of Fleischhacker still falls athwart the future of the American Merchant Marine.

With headquarters in San Francisco, the House of Fleischhacker reaches into London, into Paris, into New York. The Fleischhackers are international bankers.

The power of the House of Fleischhacker is felt in politics, shipping, the lumber and paper pulp industries of the great Northwest, the water-power combine of the Pacific Slope.

Two companies form the pillars of the great international banking structure. One, the Anglo and London-Paris National Bank, has Herbert Fleischhacker as its president and his brother, Mortimer Fleischhacker, as its vice-president. The other, the Anglo-California Trust Company, has Mortimer Fleischhacker as its president and Herbert as its vice-president.

Associated with one or the other of these companies is an imposing array of good old names such as Friedlander, Iuer, Klinker, Baer, Moss, Anderton, Vollmey, Blumenthal, Schulte, Kanter, Coe, Lilienthal.

"There are very few people on the Pacific Coast that don't in some way owe the banks money or deposit with them," said Al Lasker, former chairman of the Shipping Board and Chicago "ad" agent.

Works to Aid Bankers

IT WAS the House of Fleischhacker which Lasker chose to head the huge corporation that was to control the American Merchant Marine on the Pacific Coast and sweep all competition aside.

It was Herbert Fleischhacker whom Lasker brought on for conferences with President Harding relative to the Lasker scheme to turn over to the Fleischhackers the ships, the supplies and the opportunities of this government in the Pacific trade. But, among others, the Portland, Oregon, Chamber of Commerce gave scant encouragement to the scheme and much publicity caused it to be temporarily abandoned.

It was the House of Fleischhacker which Lasker put forward as the great motivating power he had chosen to propel the Merchant Marine on the Pacific Coast if the subsidy bill went through Congress. This was the group which was to reap most of the benefits under the proposed subsidy so far as the Pacific was concerned.

"Of course, unless we want to go on the basis of Soviet Russia, it is impossible to have shipping without bankers and international bankers," Lasker openly declared before the joint Senate-House committee during the subsidy hearings, in defending his choice of the Fleischhackers to control the Pacific shipping.

Now let us hark back to the days of 1917.

The war was on. We needed ships. Anybody could get a contract with the Shipping Board to build boats.

Out in San Francisco a group of men, including Herbert Fleischhacker, got together in a private venture and financed the building of the good ship *Faith*.

The *Faith* was a 5,000-ton reinforced concrete ship. And she was an experiment.

At Redwood City, California, with nothing much except a concrete mixer and some lumber for molds, this company built and launched the *Faith*.

When they did so there was launched upon this country a dream of concrete vessels—which proved an expensive nightmare.

After launching the *Faith*, these San Francisco gentlemen got together and launched something else. It was the San Francisco Shipbuilding Company.

W. Leslie Comyn was president. John Lawson was vice-president, U. G. Hind, treasurer, E. W. Sass, secretary. Among the stockholders were the Atkins-Kroll Company, Herbert Fleischhacker, M. M. Cohn, I. Zellerbach, J. C. Zellerbach, Sidney L. Schwartz, Henry Kirchmann, Louis H. Schwabacher, Albert W. Pfeiffer, Louis A. Sinz, M. F. Lowenstein, Irving S. Rosenblatt, M. M. Baruch, J. Y. Baruch and S. W. Straus. The predominance of Hebrew names may be a coincidence.

This company secured a contract for eight 7,500-ton concrete tank and cargo ships. It persuaded the Shipping Board to spend nearly a million dollars for a shipyard. As the work progressed, the contract was cut to three vessels, for even the densest officials soon saw that the concrete ship dream was due to be shattered as completely as the ships themselves were when they grounded.

The Shipping Board paid all the officers and all the men, met every expense, and assumed all responsibility, while the company which held the contract acted as superintendent.

When the contract was cut to three ships, according to the testimony of A. J. Frey and other Shipping Board officials before the Congressional Select Committee on Shipping Board operations, these San Francisco gentlemen lost interest. They were, apparently, not so much interested in the war as they were in the money to be made out of concrete shipbuilding, if Mr. Frey, later a $25,000 a year aide to Al Lasker, is to be believed.

The next appearance of the Fleischhacker influence was in what was known as the "Bardee contract."

"Jack" Bardee, Portland, Oregon, suddenly appeared in Washington and began to bid on ship steel left over from the construction program. He outbid the other Jewish junk dealers and secured the contract. For some of the steel he was to pay $45 a ton, for some $35. For fabricated steel he was to pay $25 a ton, and so on. The steel market was high then.

Everybody thought Bardee was "stuck."

Resigns—Reappointed

THE next development was when H. H. Weaver, steel expert on the Shipping Board Claims Commission, resigned and became an official of the Bardee Steel Products corporation.

Then Mr. Weaver was reappointed—at a dollar-a-year to the Claims Commission of the Shipping Board as steel expert—and thus retained both positions.

Following that, Bardee secured an "interpretation and amplification" of his contract which resulted in certain changes. Among these was one that a clause specifying that all steel "less than 15 feet in length shall be considered fabricated steel" should be interpreted to mean "15 feet or less." In other words, under the contract, a sheet of steel 14 feet, 11 3/4 inches in length would come within the $25 a ton class, but another quarter of an inch—or exactly 15 feet—put it in the higher-priced class. Under the change, the steel had to be a quarter of an inch more than 15 feet long or it fell in the lower-priced class. Owing to the standard lengths of ship steel as cut, that quarter of an inch meant many hundreds of thousands of dollars loss to the Shipping Board.

Another change was as to steel pieces bolted or riveted together. Unless these were taken into the deal as fabricated steel, the government would be left with scrap, practically worthless on the market except as junk metal, while the contractor would get the cream of the material. Bardee secured the changes—and former Shipping Board officials wince when they say how much the government lost by this deal.

Bardee then came forward with another proposition in which he was backed by the Fleischhackers to take over all the surplus supplies—many millions of dollars' worth, on the Pacific Coast. Probing by the Walsh committee and over-much publicity, however, caused this deal to be abandoned.

Great Corporation Planned

THE next appearance of the House of Fleischhacker was when Al Lasker brought Herbert Fleischhacker on to have a talk with the President relative to the formation by Fleischhacker of a gigantic corporation on the Pacific Coast to take over the government ships.

Then, after this scheme was well under way, Lasker proposed his subsidy plan under which the Fleischhackers were to play a tremendous and dominating part in the merchant marine plans.

Following this came the singular deal for the sale of the wooden ship fleet, which has already been narrated in THE DEARBORN INDEPENDENT columns.

Now we come to another queer turn of events.

During the shipbuilding days the Emergency Fleet Corporation bought 160 acres of land adjoining the Bethlehem Shipbuilding Company's plant at Alameda, California. The Shipping Board paid $1,035 000 for this land, and, according to exhaustive testimony given by Shipping Board officials, and as shown by many appraisals of this land by San Francisco real estate experts, all of which were submitted before the Walsh committee, the land was well worth the money. Then the Emergency Fleet Corporation spent some $5 000,000 dredging, filling, setting fine foundations and making this Liberty plant, so-called, a fine manufacturing site.

It is an ideal plant in which to convert ships, the fine, super-costly "535" passenger-cargo boats built by the government, for instance, into Diesel motor ships—especially if the Bethlehem's new Diesel motor were used.

And, 'tis said, the Fleischhackers have an eye on those "535's."

In a deal during Lasker's chairmanship of the board, the sale of the Liberty plant which cost the government more than $6,000,000, the unimproved land being worth more than a million alone, was arranged. The Fleischhacker interests through their agents acquired this plant, it is said, for the sum of $350,000, with a down payment of $50,000.

As to how many other plans the Fleischhackers figure in would be interesting to know.

What a Woman's Eyes See in Germany

By LEONORA RAINES

"MY GOD! So many men, and where do they come from?" This remark from the artist, Augustus John, might apply to Germany just now, no matter in what town you happen to be, or where your eyes wander. The men are not gathered together to view baseball returns or to await news of a horserace or to read votes of an election. They're out of work, and you'd know that the moment your eyes looked at them, for there is a psychology that is unmistakable in the mien and atmosphere of a man whose salary has been cut off and whose days hang heavy.

The hordes of idlers are not only along the Ruhr. They're in every part of the country, though the greatest mass of refugees have flocked to Hannover and Berlin. There was already an army of unemployed there, and the refugees added another quota to the number. In Cologne misfortune is less apparent, for the British soldier is well paid and his money flows freely along his allotment of the Rhine. But no matter where you go, depression is heavy in the air.

At Hannover, the people seem suffering from cold. The September day is fairly cool, but men and women, their faces thin and drawn, their lips blue, move along, muffled to the nose in wraps. Reaching Berlin, where the thermometer runs near forty degrees Fahrenheit, the populace to all appearance is indifferent to chill and the wane of summer. Pedestrians along Friederickstrasse, Wilhelmstrasse, Unter den Linden—indeed in all parts of the city—are plain barefoot. Men and boys wear no shirts. Their breasts and necks are exposed. The bare feet do not all belong to beggars, for it is said the beggars do not represent the class that is worst off.

Germany used to be full of military and "whale fronts." Hunger has whacked off the latter, and the only military uniforms I see are worn by the French. Avenue cafés and sidewalk beer gardens are still doing business, but pedestrians don't look in the direction of refreshment shops. Walking along, the air gets in the lungs, muscles stretch and contract, and the exercise does not cost money!

Faces I meet are almost void of expression. Privation, suffering, misery, no hope in the future, seem to have numbed feeling, and features are dead to sensibility. Beggars used to be unknown quantities in this land of industry and sobriety. Now beggars are so numerous that they are commonplace. Except in the occupied areas, most of the stores remain open, but save for the grocer and table supplier, no place does business. Employes are there waiting for customers who never appear. Should a customer happen in, there is little to tempt, none of the dry goods shops having renewed supplies since early spring.

I myself went to shop in Berlin, but found no choice in wares. No silk stockings, no crystal beads, no feminine knicknacks. War and defeat destroy feminine conceit, and that is proved from the fact that I notice no women eyeing windows displaying clothes and headdress. German women have come down to material necessities, and they have deserted vanity accessories for accessories of the inner man. I have seen both women and children, grouped silently in front of a baker's window, gazing with soulful eyes at loaves of bread and sweibach.

In Düsseldorf, in Essen, in Weisbaden, beauty parlors exist in name only. Windows are complete and alluring enough, but enter, and you'll find the rooms deserted. No one there but the proprietor, and he tells you that nothing is for sale, that what you see represents his entire supply, and that the shop is there to let passers-by know that he has not quit the business, but hopes to serve the public when the district is free.

Streets present a novel sight. The middle of the road is practically destitute of vehicles, and people appropriate it. Cabs are few and remain mostly at stations. They are old and full of scars, and to judge from his irritation and fretfulness, the cabby's disposition is full of scars also. The horse is nothing but a bag of bones.

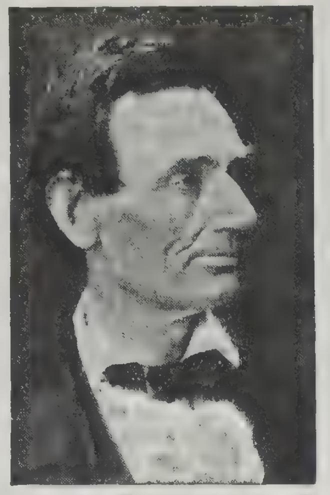
I saw thousands of what they call "colored" soldiers at Aix la Chapelle with Belgian troops—Turcos, Arabs, Moroccans and so forth. At Weisbaden, the real African Negro is in command—(high officers being French)—the big, black, strapping Senegalian, whose ebony skin and red lips are in marked contrast to the electric-blue uniform.

The army of occupation is given full sidewalk by Germans. I believe this is a result of a suggestion by the Reich government, that altercation may be avoided. There is no sign of greeting, for the good reason that the passers-by don't appear to see each other. Germans resent the presence of the French just as much today as they did in January last when the enemy soldiers marched in, 100,000 strong, with tanks, bayonets, guns—as they said, to protect their engineers and to collect a debt.

Were there not so much misery and starvation about, carrying money and making purchases that convince one one is a multi-millionaire would have a humorous side. For instance, 500,000 marks for a glass of beer, four million marks for a dinner, twenty million to have a dress made, forty million for a coat—it all sounds very grand, and it all takes up a big place in pocket and wallet. A handful of bills may amount to but a few cents, and a deskful may represent but a few dollars.

I attended a service at the aristocratic Marien-Kirche last Sunday at Düsseldorf. Many of the parishioners have fled, but some stayed on rather than ask permission of the invading army to allow them to travel.

After making announcements of the week, the young priest, awkwardly approaching his subject, fidgeted a moment with his book, then plunged boldly as he said: "Before leaving the altar I will make an announcement, the like of which I think has never been made by a priest from any altar. I wish to say that for a long time we priests have had one hot meal a week, composed of meat and a vegetable. The rest of the time we live on dry bread. I would be silent, but for the fact that our rations, short as they are, are dwindling."



Abraham Lincoln, a photograph taken by Alexander Hesler at Springfield, Illinois, a few days after the Chicago convention which nominated Lincoln.

Lincoln's Gettysburg Address, Delivered November 19, 1863

FOURSCORE and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field, as a final resting-place of those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this.

But, in a larger sense, we cannot dedicate—we cannot consecrate—we cannot hallow—this ground. The brave men, living and dead, who struggled here have consecrated it, far above our poor power to add or detract. The world will little note, nor long remember, what we say here, but it can never forget what they did here. It is for us the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.

When Lincoln Spoke at Dedication of Gettysburg

Concluded from page 11

the date named and ended by saying: "I cannot safely name an earlier time than the nineteenth of November." Mr. Everett's selection of the date fixed the time for the ceremonies. Others were invited, including General Meade, who had commanded at the battle, but he replied: "This army has duties to perform which will not admit of its being represented on the occasion."

The governors and Mr. Wills had the thought also in mind that the national government should be represented, and accordingly he invited President Lincoln. With the official invitation went a note to the President in which Mr. Wills urged his presence; invited Mr. Lincoln to stop at his home because the hotels would be crowded and in confusion, and called the President's attention to the fact that both Mr. Everett and Governor Curtin would also be guests at his residence.

The invitation read:

"The several states having soldiers in the Army of the Potomac, who were killed at the Battle of Gettysburg, or have since died at the various hospitals which were established in the vicinity, have procured grounds on a prominent part of the battlefield for a cemetery, and are having the dead removed to them and properly buried. These grounds will be consecrated and set apart to this sacred purpose, by appropriate ceremonies, on Thursday, the 19th instant. Hon. Edward Everett will deliver the oration. I am authorized by the governors of the different states to invite you to be present and participate in these ceremonies, which will doubtless be very imposing and solemnly impressive. It is the desire that after the oration, you, as Chief Executive of the nation, formally set apart these grounds to their sacred use by a few appropriate remarks. It will be a source of great gratification to the many widows and orphans that have been made almost friendless by the great battle here, to have you here personally; and it will kindle anew in the breasts of the comrades of these brave dead, who are now in the tented field or nobly meeting the foe in the front, a confidence that they who sleep in death on the battlefield are not forgotten by those highest in authority; and they will feel that, should their fate be the same, their remains will not be uncared for. We hope you will be able to be present to perform this last solemn act to the soldier dead on this battlefield."

The call to Gettysburg was one not to be put aside and the President agreed to attend.

Mr. Wills has indicated that "a few appropriate remarks" would be all that would be required of the President.

There is no certain record of when Mr. Lincoln began to write the address. It was not until the seventeenth, the day before leaving for Gettysburg, his secretary, John G. Nicolay, says.

There are many stories told as to the place, the manner and the time when the address was written. There has never been the slightest intimation, however, that any person other than Abraham Lincoln prepared any part of it.

The sending by Mr. Wills of his fervent letter has an added interest beyond the fact that it was addressed to Lincoln. It is more than possible that some of the sentiments expressed in it suggested to the President's mind the line of thought which he followed in his great address. A careful reading of the invitation and of the address—a comparison of the two documents with the common occasion of their inspiration kept finally in mind—will bring to most of us this sure conclusion: *Mr. Lincoln's address formed the public answer to Mr. Wills' invitation!*

It is believed the first person to be informed that Mr. Lincoln's mind was working upon the address was Noah Brooks, a newspaper correspondent and later an editor. He spoke to the President and was told of the receipt of an advance copy of Mr. Everett's address; Brooks was assured that there was no danger of the two addresses covering the same ground.

"My speech is all blocked out. It is very short," and he further assured Brooks that it was "not exactly written. It is not finished, anyway."

Several authors, who have written about Lincoln and of this period, have claimed that it was written on the train on the way to Gettysburg and not prepared in Washington at all. A son-in-law of Mr. Wills, William P. Quimby, stated that it was completed on the night of the eighteenth of November at the Wills home, taken to Secretary Seward that same night, was approved by him and, of course, delivered the next day. Isaac N. Arnold, in his widely read life of Abraham Lincoln, declared that it was written while en route to Gettysburg. Ben Perley Poore also stated that the words "were written in the car on the way from Washington to the battlefield upon a piece of pasteboard held on his knee." Professor John T. Morse asserted that in the original first draft Lincoln had used a quotation from Daniel Webster in his reply to Hayne: "When my eyes turn to behold for the last time the sun in heaven." James Speed, friend of Lincoln, in an interview in 1879, said that "the day before he left Washington he found time to write about half of his speech."

Spangler's Spring, Gettysburg. This is one of the famous spots of the battlefield.

But for Lincoln's ever faithful, ever reliable secretary, Nicolay, we would never know the whole story of the address. Fortunately for the world he has told us what he knew and all that he knew of it.

Nicolay says that the original draft of the address was made partly at the White House—the first nineteen lines, and that the last nine and a half lines were written at the Wills home on the morning of the nineteenth of November. His account is to the effect that the speech was in Lincoln's pocket when he left Washington for Gettysburg; that it was not written on the train nor was it completed on the evening of the eighteenth, so that it could not have been submitted to Seward as recounted by Mr. Quimby.

The first part of the original draft—the Washington-prepared part—was in ink in Lincoln's writing and ended with the words, "to stand here." This made the nineteen lines complete. When Lincoln wrote the rest of it he struck out these three last words with pencil and wrote above them, "We to be here dedica-" making the first page complete. What follows is in pencil and written on the second page, different paper being used. The words are "ted to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they here gave the last full measure of devotion—that we here highly resolve these dead shall not have died in vain; that the nation shall have a new birth of freedom, and that the government of the people, by the people, for the poeple, shall not perish from the earth."

Within a few days after the delivery of the address Mr. Lincoln was requested to supply copies of the address. The copy which Lincoln held in his hand but did not use in delivering the address contained words somewhat different from his spoken sentences; it now reposes in the Library of Congress. He made a copy as he recalled the words, slightly different from the first version. This likewise is in the Congressional Library.

Still later the President made at least four *revised* versions, all different; one for Mr. Wills, which was lost; one for Bancroft, the historian, to be sold at a Soldier's fair but kept by Bancroft with Lincoln's permission as he had written on both sides of the paper; and another for Bancroft to replace this draft; and still another for Edward Everett.

Of the two copies furnished to Bancroft, one is now owned by Professor William Bliss, of Baltimore, while another is in possession of the Public Library in New York. The version written in 1864 is the recognized standard version. All copies vary slightly. The chief changes were "those who died here" for "those who here gave up their lives"; and "This we may in all propriety do" to "It is altogether fitting and proper that we should do this."

Judge Wills is buried in the Evergreen Cemetery, at Gettysburg.

Gettysburg, originally but seventeen acres and purchased at trifling cost, has since that time had hundreds of thousands of dollars spent upon it. And the man who first inspired the nation to do all this was David Wills, who likewise inspired Lincoln by his invitation.

The Politician Who Tried to Use the Red Cross

Even When He Was Peremptorily Fired He Capitalized His Experiences

This is the second and concluding article on the activities and operations of the Red Cross written by a person who has been with the organization for several years. There is nothing but facts, dispassionately stated, here introduced. The first article had to do with the war work up to 1917.

IN 1917 someone said that Red Cross was like a toy balloon that turned into a Zeppelin overnight. When one considers the conditions that confronted the New York men who came to Washington in May of 1917, the millions that poured into the treasury of the organization the following summer, the necessity of getting together a force of men and women to outline policies, to do the bookkeeping, to buy supplies and to arrange for shipment of material and personnel overseas, all at a time when our government was feverishly engaged in a very similar job, the wonder is that the Red Cross job was done at all, much less done well.

This article is written from the headquarters point of view because more effort was concentrated at that point than elsewhere and the factors were more easily seen. The spirit of the headquarters force was high, the intentions excellent, the mistakes many (and mistakes cost money), and after the force of fifteen hundred had been got together, much weeding out had to be done. There were a few who were insincere, close to fakirs, in fact, but there were no thieves or grafters.

There was one curious aspect in Washington—the alignment between volunteers and paid individuals. In a very short time a line of separation was easily seen. A certain distinction accrued to the volunteer and, per contra, the hired folks came to feel that they were servants, of the upper class, to be sure, like valets, but still they had a place below the salt always, and as the days went on this line of demarcation became clearer.

There was one man who volunteered in a certain department because he had an excellent salary from the Food Administration and the latter apparently had little work for him to do.

Bragging Costs His Job

ON ONE occasion he taunted a humble hired worker in the vineyard with a speech which went about like this: "You are a fool, Ed Why do you work on a salary? Why not volunteer as I did and work for nothing? But watch your Uncle Tom. By and by I will get on the pay roll and when I get there I will land something worth having." Within two months Tom's name was certified to the pay roll, with elaborate O. K's by unpaid volunteers in the main building. He achieved a salary of a thousand dollars a month and had it dated backward to the time when he had first "volunteered." He had landed right on top with the highest salary then paid by the organization.

Unfortunately for Tom, however, his braggadocio act had been performed in the presence of a hired man who had certain ideas of propriety and the latter peached on him where it would do most damage to Tom and most good to Red Cross and Tom never drew the salary set, and was soon out of the organization altogether.

There were two classes of volunteers, those who had private means which permitted their serving without pay and also to pay all traveling expenses and the like, and those whose peace-time employers kept them on their pay rolls but allowed them to serve Red Cross in Washington or elsewhere. And there was a corporation which sent their employes but rendered a bill to Red Cross for salary and Washington living expenses which was paid in lump sum by Red Cross. Again some one's idea of propriety was offended and these men (who had inadvisedly called attention to themselves by publishing the alleged fact that they belonged among the patriotic, aristocratic class of "volunteers") were returned to their corporations. It is only fair to state, however, that the employing corporation had sent their men in response to a request from the management of Red Cross and that the same corporation had other men at work in Washington for whose services they did not render a bill.

In all discussions of the waste or improvidence of expenditures by either the government or Red Cross in Washington (and there was little to choose between the two as to merits, or demerits) the state of mind of America in 1918 must be considered.

The basis of calculation as to purchases, kind, quantity, and amount was along these lines: 2,000 000 men are overseas, 2,000,000 more are in camps (the second draft) and will be sent as soon as possible; the Allied casualty list is running about 50,000 a day; means must be provided to care for 50,000 sick or wounded men every twenty-four hours; the campaign will go well through the winter of 1918-19.

Figure out the quantities required for twenty days, say, and you have an answer of a million men to be nursed and otherwise cared for. Such a fever of buying, shipping, planning as existed in Washington from March, 1918, to the July battles around Chateau Thierry and beyond to the date of the Armistice was never seen on the globe. The Red Cross force at headquarters worked long hours, and knew no holidays or Sundays. The disbursements for October, 1918, the peak of the whole war enterprise, amounted to more than forty million dollars.

The purchasing force at headquarters was guided by a man of large experience from Chicago, formerly the purchasing agent of a large packing concern. He was assisted by the best talent in his line. All were full volunteers. There were countless problems, not only as to prices but, what was then of vastly more importance, as to the certainty of delivery of goods. The government was taking many commodities in large quantities. Red Cross had to take what they could get. These conditions must be called to mind in any comment on the results.

The tremendous volume of activity stopped suddenly and the story of what was unnecessarily purchased, what was left over, what was done with it, is known to few.

People are always more interesting than things. The men at headquarters and in the field constitute a more interesting study than the articles purchased. The massing of these people and their co-workers was only seen on the occasion of the big parades.

A pessimist husband and an optimist wife were watching an unending line of blue-veiled nurses in a street parade in Washington. Notables marched in front, near-notables marched at the head of sections, almost-notables marched at the head of sub-sections. Bands played, flags were saluted, cameras clicked, the marching men and women looked proud, many looked conscious. There were so many marching the wonder is that there were any to play the rôle of spectators.

Said the pessimist husband: "If some avenging deity were to throw a bomb in that parade guaranteed to kill those who are there from motives of vanity only, how much of a parade do you suppose there would be left?" Said the optimist wife: "There would be a great many left but there would be no one you or I ever heard of."

The departure of the Morgan partner from his desk at Broad and Wall streets was loudly acclaimed and it was a most dramatic and impressive happening, but many others left their counting rooms whose names have never been mentioned in public print except casually, men who did not march in processions—they just worked. They were big men at home, they disappeared in the crowd in Washington. A man of many millions made in the textile trade in New York City and a Wall Street lawyer with an enormous practice bore the brunt of the planning during the war.

A high official of the biggest public utility corporation in America organized the accounting department, but when the government took over his company on July 1, 1918, he had to go back to New York and leave his big war scheme to be carried out by subordinates and it was the latter who evolved the absurd cost-accounting mentioned in an earlier paragraph.

The Story of the Circus Tents

RED CROSS was very, very human. It was a tremendous organization hastily thrown together to accomplish things in which hurry and speed were the chief characteristics. It was not perfect. It was very far from being perfect. Gross figures of accomplishment can be given, detailed accounts of costs according to conventional business standards never. It might have been done better. It might have been done worse. The story of it all would comprise many chapters and there would be an abundance of both tragedy and comedy in it.

There is a story of six huge circus tents bought for temporary hospitaling, not used; sent to England to furnish shelter for convalescents, not used, but stored; sent to Vladivostock to shelter Czech-Slovak refugees, not so used because the Bolshevik chased everyone away; sent to Constantinople for some purpose incident to the attendance upon General Wrangel's unhappy and short-lived adventure in the Crimea; sold to the French Government for more than cost to shelter Russian refugees who had followed Wrangel out of the Crimea, not so used for some reason yet to be found out.

It was not intended that anyone would get any personal glory or advertisement from the work of Red Cross. Prominent men advertised the organization by their connection with it. Some few tried to capitalize their charity work in after-war politics. One man succeeded in getting away with this during the war itself. His accomplishment was a notable exception to the rule and it deserves to be told before this account is brought to a close.

A certain quasi-patriotic politician went overseas to work in connection with the Paris office. He so busied himself and his subordinates with accounts sent home of his unselfish work at the front that he was peremptorily fired by the chief Red Cross executive in Europe. But he was an agile gentleman and landed forthwith in the bosom of another American charity working in France and continued sending home accounts of his valor. He actually succeeded in being elected, while he remained in France, governor of his state and in persuading himself that he was eligible, as a dark horse, for the nomination for President of the United States at the hands of one of the two major political parties. By a humorous coincidence another former Red Cross man who had operated overseas more to his own satisfaction than to that of his organization thought he was a candidate (dark horse, too) for Vice-President on the same ticket. Unhappily for these two distinguished gentlemen nobody seemed to know they were even candidates besides a chosen few.

Had this precious pair landed together on that ticket, much that is written in these articles and a very great deal that has not been told would have come to light and maybe some one would have actually found out how much of Red Cross money was actually spent for real relief and how much was spent otherwise.

Hoover Can Do Much

SINCE these articles were written the Japanese earthquake has startled the world. The American Red Cross responded to the call for help by an appeal to America for five million dollars. The response by the American people has been well in excess of eight million dollars and the campaign has been declared ended.

John Barton Payne, the present executive of Red Cross, has announced that "no administrative cost will be charged against the fund collected for Japan." If Judge Payne's idea of an "administrative cost" is that of the man on the street, well and good. Splendid, in fact. If the brain-spraining definition of "administration" and "relief," by virtue of which the larger portion of even the fuel-cost incurred at Washington and division headquarters from 1917 to 1921 was set down by Red Cross accountants as spent for "relief," is still in vogue, public confidence in the organization will be shaken and a most useful instrumentality for good harmed.

The accounting force at Washington headquarters, reduced in numbers, is practically the same that it was during 1917-21. Judge Payne did not take office until October, 1921, and it is entirely possible that he does not know of the disingenuous accounting prior to his service.

The executive committee, whose attention was called, most forcibly, to the weird accounting in 1920 and 1921 is the same now, almost, as it was during the war. However, there has been a notable addition to this governing committee during the present year in the person of Herbert Hoover. Perhaps he does not know the past history of the accounting department of Red Cross. Mr. Hoover's confreres on the committee listened to no protests as to accounting but he had much experience in relief work in Europe and knows the difference between flattering "ratios" and truth.

A large section of the public feels the need of reassurances from John Barton Payne and Herbert Hoover.

We Visit the Poet Laureate of England

Concluded from page 3

water, gathered up our shoes (which we never can remember to set outside the door in proper style), and departed. We drank our tea indolently, though it did seem rather a strong morning greeting to our stomachs, and then rose. The fresh green trees were to be seen outside every window.

We were all dressed, and it was time for breakfast, but our shoes had not reappeared. One does not like to present one's self at breakfast in one's stocking-feet. I remembered seeing a place below in the hall where stood a stately array of shoes, and slipping down, sure enough, I found ours sitting shyly by. I do not know even now whether the maid forgot them, or whether one is supposed to gather them in for one's self. At any rate, I seized ours and returned triumphant to our bedroom.

After breakfast appeared the automobile which was to take us back to Oxford. Mr. Bridges rode in to town with us. He likes to walk to Oxford, but Mrs. Bridges confidentially told us that the walk there and back is really too much for him, and she discourages him whenever she can. He was clad in a fine-checked suit of black, red, and white, with a broadbrimmed light gray felt hat that added to his natural picturesqueness. It was with much regret that we left the pleasant home and its friendly inmates.

Perhaps a word should be said about Mr. Bridges' poetry, not too well known to Americans. It is of the older school, naturally, classical and finished to a degree quite the antithesis of the present free verse. In fact, he has written many poems on classical themes, has experimented with classical meters in English, and even in his poetry he is first the scholar. His more personal poems have something of the aloofness of the earlier poets, before the race began commonly to tear every vestige of drapery from their emotions. I was talking with an English man of letters who knows and admires Mr. Bridges. "I think," he said, "that Mr. Bridges is a great poet—in a small way. That is, though his scope is limited, or seems so to our generation, what he does is perfect." Here is a sonnet that sets forth the poet's creed:

For beauty being the best of all we know
Sums up the unsearchable and secret aims
Of Nature, and on joys whose earthly names
Were never told can form and sense bestow;
And man hath sped his instinct to outgo
The step of science; and against her shames
Imagination stakes out heavenly claims,
Building a tower above the head of woe.

Nor is there fairer work for beauty found
Than that she win in nature her release
From all the woes that in the world abound:
Nay with his sorrow may his love increase,
If from man's greater need beauty redound,
And claim his tears for homage of his peace.

Beauty Lavished on Vermont's Open Spaces

And Fat Trout Fill the Streams of Home State of President Coolidge

By ANNE MILLER DOWNES

These photographs furnish an idea of the beauty of Vermont.

WILLIAM H. LORD once said, "We have always thought the Almighty intended when he formed the hills of Vermont and shook out the green drapery of the forests over their sloping shoulders, and made them fall in folds like the robe of a king along their sides, to give us a dim picture of the new creation and the celestial realm."

We thought of this and also of Henry Ward Beecher's, "A place in the midst of greater variety of scenic beauty than any other I remember in America," when we packed our camping outfit and started for Mount Mansfield.

Fortunately, some early settler kept the two French words Verd and Mont and used them in the name of the state. The name brings before the city-dweller's mind the endless soft, refreshing green; even the tops of the mountains are completely covered with fir balsam.

Many articles interpreting President Coolidge are appearing in the various periodicals of the country; most of them stressing the rugged nature of the land, the difficulties of farming in New England; difficulties great enough to discourage anything but strong men with set jaws. All this has gone into his making but also—and I am not sure that we haven't here the bigger thing—he has the inheritance of one of the most romantic spots in America. The Vermonter has the hankering of the Alpine for his native mountains. Volumes are written about the beauty of the state, its three hundred and more lakes and ponds, Lake Champlain, 118 miles long, the Green Mountain trail, extending now for 300 miles along the ridges; where one can tramp with knapsack and strong boots, getting unsurpassed views, comfortable camping shelters, and finding each section of the trail cared for by the various townships through which it passes. Is there another such trail in the country?

If you want romance you have it in the tales of the Green Mountain Boys, tales of Ethan Allen, Seth Warner, Remember Baker, the old Catamount Tavern where the plans for the capture of Fort Ticonderoga were laid, Bennington, the Hazen Military Road, 2,000 feet above sea level. There is the largest marble industry in the world centering in Rutland.

We started from Pittsford in the early morning, going through Brandon, skirting beautiful Lake Dunmore, leaving the state roads but always bearing north. We were anxious to pass through the Mad River Valley near Warren.

It is all its name suggests and we stopped and ate our lunch by the great falls.

Reaching Waterbury in the afternoon, we laid in supplies of fresh meat and fruit, went due north to Stow, a village of rare charm, leaving there by four o'clock by way of the direct Mount Mansfield road.

By five we had chosen our camping place, a sheltered field near a stream. We stretched a canvas over the tops of the motor cars, making a room where we made up our five army cots, being careful to put as much under us as over us, built our fire, cooked a hearty supper and, snug in our sweaters and woolen socks, were soon fast asleep.

We were up with the birds at four, starting our fire, cooking bacon, eggs and coffee, packing our bedding and on our way up the Mansfield road by eight o'clock.

We were told that $80,000 had been spent on these roads and could well believe it. No state road could equal them for smoothness, but this had been true of all the mountain roads in the state.

What a ride! Miles through the forest, up and down, like a scenic railway. And the rivers! Robert Louis Stevenson says, "There is no music like a little river's." Vermont is full of little rivers, surprising falls and clear brooks full of trout. We were aiming to reach the Smuggler's Notch. No signs are needed to inform the traveler he is there. It is a sharp mountain pass cut between the chin of Mansfield and Sterling Mountain, the result of some violent disturbance of the earth's crust. The cliffs rise 1,000 feet or more almost perpendicular on either side of the narrow, twisting path.

We felt ourselves as insignificant as ants as we looked up at the rugged tops lost in swift-moving, angry gray clouds. Two eagles circled about one of the highest cliffs, moaning piteously. After watching them for some time, we concluded that a snake must have found their nest.

There are great boulders along the road side, probably loosened by frost. There is a beautiful crystal spring, pouring out of the base of a cliff 1,000 feet high at the rate of 1,000 gallons a minute.

We went on through the pass to Mount Mansfield, the great stone giant, lying, through the centuries, with his face turned to the sky. He is five miles long; there is the Forehead, the Nose, the Lips, the Chin, the Adam's Apple. How serenely and patiently he lies while the tiny human flock swarms about on his breast.

We wanted to investigate every point of beauty—the Lake of the Clouds north of the Chin—the Cave of the Winds on the east side—the Rock of Terror projecting over a great precipice—the Moss Glen Falls.

The view of Lake Champlain is very beautiful with the Adirondacks in the distance; one can see both Marcy and Whiteface. Across the valley there is a panorama of villages, fields, roads and forests and always the New England church spire rising through the trees.

On a clear day, one can see Owl's Head and Jay's Peak on the Canadian border and even Mount Royal towering over Montreal. To the east lies the Connecticut valley, across which one sees the Presidential Range in New Hampshire, while to the south lies a wilderness of mountains.

We usually camped for the night where late afternoon overtook us. This happened to be Peacham our second night.

We were cordially welcomed at a well-built, slant-roofed farmhouse by a "regular" Vermonter who gave us permission to fish in a near-by trout stream. Later, with his lantern and a collie dog, he visited us.

We found we were but a stone's throw from the early home of Ambassador George Harvey. We inquired of our host if he knew George. "Oh, yess," he replied, "I knew George well enough."

"Well, what kind of a chap was he?"

"W-ell—George was just about the most ar-gumentative young chap in the whole town of Peacham. All right, George was—but—talk—well, I guess he's made his living out of talking; yes—I guess—he's still talking."

What Does Future Hold for Palestine?

Concluded from page 9

safe harbors, one at Jaffa and one at Haifa. By building a breakwater some four or five miles out into the sea, half on the Haifa side of Acre Bay and half on the Acre side, a thing easily possible and without an enormous expense, and Haifa and Acre would have one of the finest harbors anywhere. It would be a little more difficult and somewhat more expensive to construct a safe harbor for Jaffa and Tel-Aviv, but it could be done and would be a tremendously paying investment. With the completion of the two parallel lines of railroad running north and south, one on either side of the Jordan, and then cross connecting lines every fifteen or twenty miles, Palestine would have one of the best railroad systems of any country. The opening of good auto and wagon roads throughout Palestine connecting all parts of the country with the various railroad stations would be feeders to these railroad lines, and would greatly facilitate commerce with the outside world. Palestine has always been at the center of the great commercial highways of the Orient. The lines from Egypt to Babylon, from Egypt to Asia Minor and Constantinople, from Constantinople to Babylon, to India and to Egypt have all passed through this little country. With the completion of the great Bagdad railroad connecting Europe with Asia and passing through Northern Palestine, and with the railroad already completed through Palestine to Egypt and the Suez Canal, Palestine more than ever will have the opportunity of becoming a great commercial center. Germany realized this and was laying her plans, through alliance with the Turkish Government, to get control of this rich possession.

Notwithstanding the awful harbor situation at the present time when ships are compelled to anchor from half a mile to a mile and a half from the shore and lighters have to be used for loading and unloading all goods and cargoes, and when the loading or the unloading of a ton costs from seventy to eighty piasters, that is, from three and a half to four dollars a ton, sometimes the loading or unloading costing more than the shipping all the way from or to a European port, notwithstanding all this, forty-one steamers anchored at Jaffa during the month of January, and probably many more during February. Now one of the most productive orange districts in the world is that which centers about Ramleh. Here are grown the sweetest and most luscious oranges I have ever tasted. They are being sent to every leading port in Europe. This part of Palestine is capable of producing a thousand boxes of these oranges where it now produces one. Give Palestine two large, safe ocean harbors, let her agricultural possibilities be fully developed, let her become the manufacturing center that she is capable of becoming, and then add to this her position at the center of the great oriental trade routes and nothing could prevent her becoming one of the great commercial nations of the world.

With increased productivity and with her manufacturing possibilities developed, Palestine's population would multiply manyfold. The time was when Palestine possessed and supported a population many times what she has now. Her population today is less than a million all told. With her farming possibilities developed she could support by farming alone ten times the population she now has. With the building of great factories and the development of commerce there will necessarily grow up great cities. So that within the next fifty years she might easily have from ten to twenty-five million people.

If these possibilities become realities the present population must prepare itself for making them become such. There should be a public school system inaugurated throughout the whole of Palestine and compulsory attendance of all children should be insisted upon. High schools and manual training schools, agricultural schools, schools of technology, schools of mechanical and electrical engineering should be established for the training of the young men and women to become leaders in all these various lines of development. The Arabian young men and women are bright and keen. They are industrious and economical. With the training I see no reason why they may not make their country prosperous and influential.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

The American film, "The Birth of a Nation," has been suppressed by the Paris police.

Alaska, with an area one-third greater than the Atlantic states, has no more white residents than there are office workers in any one of several skyscraper buildings of New York City.

The men working the "Spanish prisoners" confidence game have been run down and arrested by the police of Barcelona, Spain. The police found carefully kept files of names and addresses of persons from whom money might be obtained. Employes of the Barcelona telegraph office were apprehended among others.

Leodegardus Barthelme, of Winneshiek County, Iowa, has won the highest prize awarded for the Ton Litter Futurity Contest. Barthelme's litter of pigs weighed 3,199 pounds in 180 days and scores him ahead of any litter that has been raised up to this time in the United States.

Former President Harding's make-up rule has been presented to C. F. Hard, manager of the Front Porch Campaign. The little steel rule was in Warren Harding's pocket when he was nominated in Chicago, and it was with him when he died at San Francisco.

A military map and plan, used by the British at the battle of Bunker Hill, has been sold at auction in London for $950. The map, eight inches square, bears the signature of Major-General Sir Henry Clinton.

Another attempt will be made to scale Mt. Everest, the world's highest mountain, in 1924. Brigadier-General Honorable C. Bruce has been chosen to lead the fresh attack.

After chopping with axes for more than two hours, workmen succeeded in rescuing a man from a block of asphalt where he had been imbedded all night, at Canton, Ohio. He had fallen over a small embankment into a pool of warm asphalt while walking near an asphalt plant the night before his discovery. In the meantime the asphalt hardened. He apparently suffered no serious effects.

The forging of Uruguayan naturalization certificates, to enable Europeans to enter the United States as Uruguayans, has been disclosed. The Uruguayan law requires a residence of five years before citizenship papers are granted an immigrant. Certificates were obtained in great numbers by false declarations of witnesses who apparently were members of a strong organization which has ramifications in Argentina and Brazil.

A nine-room house, estimated to weigh seventy-five tons, was recently towed four city blocks in Los Angeles by a five-ton truck carrying eight tons of pig-iron ballast to give traction.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

BINDERS

Readers who desire to save their copies of The Dearborn Independent can now obtain a specially constructed cloth covered post binder. This binder is very practical, holds 52 issues and permits immediate reference to or removal of any copy without disturbing any other issues. Price $2 each delivered. Remittance must accompany orders.

A French yachtsman, in an engineless thirty-five-foot sloop and unaided by a crew, sailed from Gibraltar to New York City 100 days from the date he set sail.

A cross said to be the highest in the world is that on the spire of the new Chicago Temple. Towering 560 feet above the ground, the cross, twelve feet high and six feet wide, appears but a few inches in dimensions. Great flood lights will illuminate it by night while the reflection of the sun upon the gold-leaf-covered arms will make it visible for miles in the daytime.

Senator Overman, of North Carolina, is one of the few Senators who occasionally takes a pinch of snuff from the historic snuffboxes in the Senate Chamber, which are kept filled during the sessions of Congress.

The Lakes of Killarney in Ireland are owned by the Earl of Kenmare, who has preserved his heritage from commercial encroachment.

At the Y. M. C. A. National Convention, Mark M. Jones, economist, said that of every dollar given to the institution, sixty cents went for actual "Y" work, twenty-one cents for expenses in collecting the dollar, and eighteen and one-half cents for duplication and overlapping.

The "grape cure" is practised in Switzerland by persons who are troubled with gout or liver diseases. The time they spend among the grapes of Mt. Pelerin, above Vevey, or Bex-les-Bains, seems to benefit and calm patients. The juicy white grape of Switzerland is most beneficial because of its easily digested skin.

Diving on a wet concrete pavement more than 100 wild ducks broke their necks near Champaign, Illinois. The pavement, wet from a drizzling rain and lighted by the moon, looked like a shimmering body of water.

To check the exodus of Mexicans to the United States, President Obregon has offered 250 to 500 acres of land to those who will settle on the land.

A total of 138,352 persons visited Yellowstone National Park during the 1923 season. Of this number 91,224 came by automobile.

Poetry and songs in Esperanto are appearing in polyglot centers of Europe.

Dr. Marion LeRoy Burton, president of the University of Michigan, says: "Citizens who go into public service in America today do so at a tremendous price. They sacrifice large salaries paid in other fields to hold public office at a financial loss. Every corporation in this country knows the greatest extravagance is economy in buying leaders. Yet in this nation the highest honors we can bestow are rated as beneath a man of ability. From my experience I know university presidents are underpaid. Day by day, positions are offered to me paying salaries four or five times what I am receiving now."

Samuel M. Vauclain, president of the Baldwin Locomotive Works, has a contract with a physician to keep him in physically perfect condition for ten years. A flat sum is paid every year. Every two weeks Mr. Vauclain takes a physical examination. If he falls sick, deductions are made from the annual retainer.

Ninety per cent of the silver fox pelts sold now are from ranch-bred animals.

A bamboo organ in the Catholic church of Los Pinas, near Manila, Philippine Islands, was built about 1818 by a Spanish priest, who used more than 900 lengths of bamboo in the construction. Every part is of bamboo and the organ is still used every week by the Belgian priest in charge.

Lord Beaverbrook has bought the *Pall Mall Gazette* which was founded in 1865. It was based on the "Pendennis"—Thackery—idea of a journal "written by a gentleman for gentlemen," and was noted for its high literary quality.

MEETING THE "FACT" SHORTAGE

That is what THE DEARBORN INDEPENDENT is doing. For nearly five years it has been telling the people plain facts about things which they did not know or understand. That's why it is called the "Chronicler of the Neglected Truth."

Today THE DEARBORN INDEPENDENT has over 500,000 subscribers. You can become one by using the blank below. Do it today.

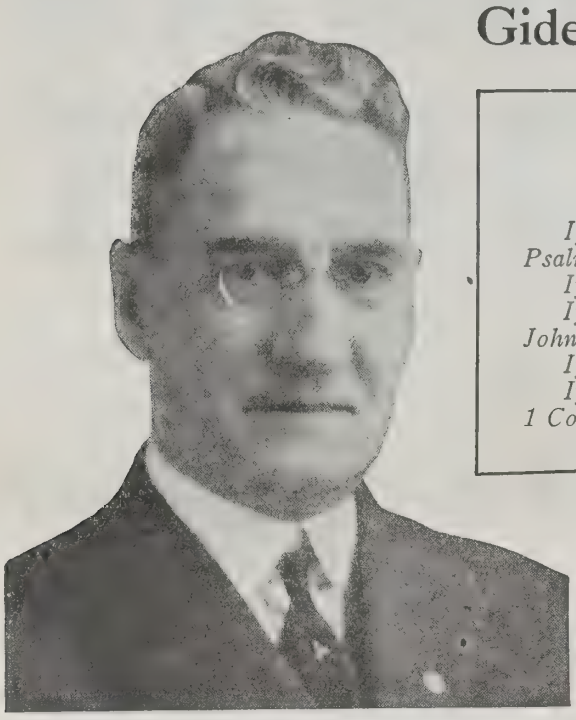
Gideons Have Placed 550,000 Bibles in Hotels of America



A. B. T. MOORE,

National Secretary of the Gideon Order at Chicago.

The Frontispiece to Every Gideon Bible

BLESSED TRUTH—ACCEPT IT. **Luke 19:10; John 3:16.**

If lonesome or blue and friends untrue, read Psalms 23 and 27; Luke 15.

If trade is poor, read Psalm 37; John 15.

If discouraged or in trouble, read Psalm 126; John 14.

If you are all out of sorts, read Hebrews 12.

If you are losing confidence in men, read 1 Cor. 13.

If skeptical, read John 6:40; 7:17; Phil. 2:9-11.

If you can't have your own way, read James 3

If tired of sin, read Luke 18:35; 18:9-14; John 9.

If very prosperous, read 1 Cor. 10:12, 13.

Happy conclusion, Ps. 121; Matt. 6:33; Rom. 12.

By FRED L. HOLMES

IN THE quiet, homelike city of Boscobel, in Western Wisconsin, girthed by a turbulent, murky river, which seems ever to be in a hurry to join the waters of the Mississippi thirty miles below, two commercial traveling men nearly a quarter of a century ago, conceived the idea of a soul-insurance organization which now stands next to the churches in acquainting people with the precepts of the Bible. The conception came as the result of a chance acquaintance. Out of it has grown an international organization of several thousand members which has placed more than 550,000 Bibles in the hotel rooms of America.

Boscobel is a city of 2,000 with clean business streets and trim dooryards to homes, many of which are owned by farmers who have retired. It is an old city, one of the first to be founded on the frontier pioneer road from the lead mine district, and is still reached by an antiquated, covered toll bridge across the river over which the produce for miles around is hauled to market. It is a friendly community, with fine schools, and with most of its business houses on the central street. The most conspicuous building on Main street is the Central Hotel, annually visited by hundreds of traveling men and serious-minded tourists, who want to rest in the hostelry that gave conception to the founding of the Christian Commercial Travelers' Association of America.

One evening in September, 1898, John H. Nicholson, of Janesville, entered the Central Hotel, which was crowded to its limits.

"We are crowded tonight, Nick, and if you will be willing to occupy a double room with two beds, on the second floor, with a fine, clean fellow, you will accommodate me very much," declared the landlord of the hotel.

"Certainly, John, anything to help you out. Put me anywhere," answered Mr. Nicholson.

A few minutes later S. E. Hill, Beloit, was introduced to John H. Nicholson, of Janesville. Mr. Nicholson said he would go to his room and do some work and Mr. Hill was to come up when ready. About an hour later Mr. Hill entered his room, No. 19, to find Mr. Nicholson at work.

When ready to retire, Mr. Nicholson took from the satchel a Bible.

"I make it a habit of reading a passage from the Bible and talk with my Lord before going to bed each night," declared Mr. Nicholson.

"I am a Christian also, let us have our devotions together," interrupted Mr. Hill.

After their prayers the two men lay awake a long time talking with each other over some plan to acquaint people with the Bible.

Another year was to pass before the seed there planted was to be nurtured into germination. The two men did not meet again on their traveling routes through Wisconsin until May 31, 1899. Then again it was by chance.

Above—Gideons and their sons carrying Bibles to the guest rooms of hotels at Denver, Colorado.

Below—A reredos of Bibles built up in the pulpit of the First Presbyterian Church of New Orleans. The books later were carried to city hotels. Former National Secretary, W. E. Henderson, in the foreground.

In this hotel, the Central Hotel of Boscobel, Wisconsin, the Gideon idea was born. Two travelling men, in casual conversation, conceived the idea of the Order.

Typical scene in thriving town of Boscobel, a sight very common to the travelling man of America.

It happened that Mr. Nicholson was on a trip to Northern Wisconsin, when he met Mr. Hill at Beaver Dam.

"Nick, we should get at it and organize at once," declared Mr. Hill. "Let's not talk about it, but get right at it. Start the ball rolling and follow it up."

Right there it was agreed that they would start organizing at once. A date was fixed to hold the first meeting in Janesville, Saturday, July 1, 1899, at 2 p. m. in the Y. M. C. A.

W. J. Knight, of Janesville, also became interested and sent out letters urging attendance at the meeting. It was the following sent to a few traveling men that gave impetus to the first meeting:

"Janesville, Wis., June 12, 1899.

"My dear friend and brother:

"It has been suggested by a few of our Christian traveling men that we might increase our usefulness and also our helpfulness to each other by quietly coming together to plan some simple organization that we might better know each other and possibly widen our influence, and by preconceived plans surround the arch-enemy of our souls, and give him a black eye by the help of Him who is altogether lovely, and the chief among ten thousand.

"Now, brother, if this meets with your approval, can you plan to meet with us in the parlors of the Y. M. C. A. about half past one o'clock July 1, 1899, Janesville, Wisconsin.

"Trusting that you will, I am as ever,

"Your brother,
"W. J. KNIGHT."

When the meeting was called there were three men present—only the three sponsors. Yet they were not discouraged.

The question of a suitable name arose and many suggestions were offered. Mr. Knight suggested the name "Gideons" and in an instant it was adopted as a God-given name. Gideon was a man willing to do exactly what God wanted him to do, irrespective of his own judgment as to plans or results. Mr. Knight opened the Bible and read the seventh chapter of Judges. The name selected was:

THE GIDEONS
The Christian Commercial
Traveling Men's Association.

After hours of planning, the meeting was adjourned to meet again at Waukesha, September 1, 1899. It was at this meeting that the "button" was designed as an emblem by which they might recognize one another. The proposal was made by W. J. Ennis that the emblem should suggest the weapons Gideon's 300 used in their first battle. Mr. Ennis drew a design of a button and mentioned the colors: a white pitcher on a blue background, with a red flame protruding from the opening of the pitcher. Mr. Nicholson shouted: "Glory to God! We have the national colors and the order will become national."

Out of these meetings in Wisconsin nearly a quarter of a century ago has grown the national order of the Gideons. It was decided that the organization would place Bibles in hotel rooms throughout the country.

Soon the interest of the traveling men was attracted

THE ETHICAL SERVICE BUSINESS RENDERS

BY J. H. PUELICHER
President of the American Bankers Association

J. H. Puelicher

I sometimes think we lay too much stress on the technical efficiency of our business instrumentalities and too little on their moral services.

Is it enough to say to our radical opponents of the present capitalistic order that it effectively feeds and clothes and houses and furnishes us with physical comforts and pleasures and therefore it is good? That is not enough. They can rightfully tell us that, even though a system may minister to our physical well-being, if it stunts us morally, if it does not positively make us better ethically, it is an inadequate system.

The general answer to this assertion is obvious. The very fact that our industry, commerce and finance serve us so amply with the materials and means for physical well-being gives us the opportunity to build and support our churches, to foster the arts, to develop our great educational system,—to be kind to one another.

But need we deal in generalities?

FARMER-BANKER CONFERENCES THROUGHOUT NATION DEVELOP WAYS TO AID AGRICULTURE

Collective Marketing, Diversified Farming, Promotion of Agricultural Education and Use of Bank Instead of Mercantile Credits Chief Lines of Suggested Action.

By D. H. OTIS,
Director, Agricultural Commission, American Bankers Association.

D. H. Otis

Four lines of action to improve the business of farming stand out in the discussions that have occurred at a series of farmer-banker conferences now being held throughout the United States. They are collective marketing, diversified farming, the promotion of agricultural education and the use of the more economical bank credit rather than mercantile credit. At many points active steps to foster action along these lines have been taken.

The conferences were initiated by the Agricultural Commission of the American Bankers Association to the end that the condition of the man on the farm be improved. The first conference was held in conjunction with the Wisconsin College of Agriculture at Madison. An important point of contact for the work of the Commission was established at this meeting in the form of co-operation with the agricultural colleges.

In five other states—California, Washington, Oregon, Idaho, and Utah—it was agreed at subsequent conferences that bankers' agricultural committees would meet at the state agricultural colleges and, in co-operation with the college officials, work out a

Many farmers, it was brought out, now depend entirely on the cotton crop, and buy the products named for their own tables.

"Boiler Plate" Aid to Propaganda

Development of an Industry Which Is Little Understood

IN ITS exposure of one of the methods by which special interests reach the people through the country press, THE DEARBORN INDEPENDENT made incidental allusion to a great manufacturing industry which has grown up since the Civil War—the industry of manufacturing ready-printed or ready-to-print material for country newspapers.

The magnitude of this industry may be partially gauged by the fact that without its aid many weekly papers, and a lot of pretentious dailies as well, would find it impossible to continue in anything like the fashion they do. The cost of operation in the publishing business is extremely high, and is curtailed by combining service and expense and spreading the same over a large number of papers. What the Associated Press does by wire, these other organizations do by sending typeset matter or ready-printed pages.

The origin of the industry was insignificant. Demand for news was so increased during the Civil War that, even with the meager facilities of the day, the city dailies were able to compete in the small towns for the patronage of the supporters of the local press, which could not meet the demand for detailed stories or enlarge their sheets to give needed space for more reading matter.

The pioneer of the industry saw in co-operation a remedy. By printing one side of a sheet for a number of non-competing country papers, leaving the other side blank for the publishers' own local news and advertisements, the cost of composition would be divided among as many patrons as could be secured. Each of the papers using the service would be able to double the size of the sheet, while the reading matter would be more than doubled in volume.

These auxiliary sheets were called "patent insides" and "patent outsides," according to which portion of the paper was printed in the auxiliary. By the acceptance of general advertising, it soon became possible to furnish the service at practically the cost of the white paper used.

Among the pioneers of the business, A. N. Kellogg will be best remembered by old newspapermen, for the A. N. Kellogg Newspaper Company was among the first to offer a diversity of service, giving the local editor a selection of feature or political matter. The Kellogg organization was subjected to attack by rivals, some of which remained in the field but a short time, others longer, and one, the Western Newspaper Union, permanently, absorbing the Kellogg company some twenty years ago.

The Mergenthaler typesetting machine widened the scope of the auxiliary sheet business by cheapening the cost of type composition, but a greater field of development started in the perfecting of rapid stereotyping, or the making of "boiler plate."

Progress in the methods of publication of country newspapers had an influence on the matter, too. Merchants were being taught to advertise, necessitating the use of more space than was afforded on the home-printed sides of the newspapers, and while full columns could be given space on the "patent" side, by cutting out column lengths of prepared material, still it was an awkward thing to get along with, and impractical in papers published at a distance, except for standing advertisements—those not subject to change.

Another influence tending to limit the field of the ready-prints or "patent" sheets is the consolidation and consequent reduction in the number of country papers. Up to the latter part of the nineteenth century even the smallest hamlet boasted rival newspapers. County seats and even smaller cities and villages each had organs of rival political parties. But now many communities, which formerly attempted to support several newspapers, find in one publication its representative of the Art Preservative of All Arts. Politics in these is usually eschewed by the publishers on their own account, any party being permitted use of the columns for a consideration, as advertising matter. This increases the demand for plate service, which has become more important than the printing of auxiliary sheets, although that department in the industry is by no means decadent. A single branch office of the principal organization now in the business still supplies say 200 country papers with insides or outsides within the limits of its territory.

The development of the plate business took the makers into specialty fields. City papers had adopted the plan of securing feature matter through syndicates. The plate houses bought copyrighted articles from popular writers, serial and short stories from the authors or publishers of the best sellers, and in every way met the competition of the growing magazine pages of the city press. They did more, for presidential messages and other important documents were secured in time to permit the country press to print them in full as soon as released, so the reader of the country weekly was supplied as soon as was the city man.

In 1876, in the Tilden-Hayes contest, the managers of the Democratic campaign began a regular use of propaganda, sending each paper of the faith a page or more of printed political matter and urging its use. This involved great expense to the publisher. It was largely wasted effort. Other means of reaching the public were the sending out of "supplements," ready-printed for folding in the regular issue. This was nearly as unsatisfactory, but later the use of the free plate matter proved the solution of a centrally controlled literary campaign that was acceptable to most of the partisan press.

That the economy of the plan and the facility with which those willing to use the matter can be reached through the manufacturer should make it a principal means of propaganda is easily understood. At first the manufacturers simply offered such service by authority of "parties interested," but that dubious tender did not free them of suspicion as to responsibility, and the position was soon taken that there should be no hiding of facts.

Every printed proof of a *free plate service,* tendering its use to a country newspaper, distinctly gives the authority for the offer. Of course "free plate service" always means propaganda. Composition, stereotyping, correspondence, transportation, all are paid for by the propagandist at the office which ships the metal, unless the order for the service originates in the main office of the house and is distributed through branches for convenience and economy. The plate makers simply sell a product of their manufacture, made to specifications furnished, with no more responsibility as to its use than a cane-maker would have if his product should be used by a purchaser as a bludgeon.

That the development of the plate business is thus an aid to propaganda, good as well as bad—if the good has back of it the means to send it out, which the bad has always—is but a natural result. It also does for the country press what syndicate service does for the city papers. "Mutt and Jeff," "Bringing Up Father," and other comic strips, in your favorite Sunday paper, are not original with it, but bought as a feature from a syndicate. Just so the cartoon and comic strips in the country paper are purchased from a plate house, or cast from a matrix furnished by it.

The reader is not necessarily cheated in the general use of plates. But he IS deceived when the editor uses propaganda without stating its source. Thus, the economic discussion which is appearing in hundreds of country newspapers was paid for by the American Bankers' Association, and should be so known. That the editor always knows is indicated on the cut given on this page, in which can be seen that the company supplying the material distinctly states what its source is. Also, readers may clearly see for themselves the facsimile and the source of all the monetary discussions they have been reading of late in their local papers.

Bankruptcy Frauds Bring Out Race Angle

In Which Indictment of Bennie, Phil, "Moe" and Joe Is Given as Example

By CHARLES ALBERT COLLMAN

THE mercantile community of New York City has been upset by an avalanche of fraudulent bankruptcies, exposures of which have disclosed an actual undermining of the time-honored business morality of the metropolis. The existence is shown of numerous "bankruptcy rings," which encourage the prevalence of false swearing, and the acts of crooked debtors in making fraudulent transfers of their property, secret preferences in failures, concealments of assets, untrue financial statements and collusive conspiracies in settlements, while the assets of bankrupt concerns are completely devoured by the fat fees of members of the rings. Investigations made by committees of the Merchants' Association, the New York County Lawyers' Association and credit organizations, have tried to throw the blame for the situation variously on the bankruptcy laws, the attitude of creditors, or the debtors and their lawyers—in fact, on a variety of causes. But, as usual, the chief reason, which is so patent that it is known to everybody, is mentioned only in subdued whispers, accompanied by dubious shoulder shrugs.

"In one expensive receivership," says Assistant District Attorney James J. Wilson, who has charge of the prosecution of frauds, "there was left for distribution to the creditors exactly six mills on the dollar. The creditors were called together and the situation announced, whereupon one indignant man exclaimed: 'Forget it; I'll take a cigar.'

"Recently a fee of $25,000 went to a lawyer-receiver, who appointed another lawyer to act as his counsel, who also got $25,000, and the public accountant, who really did practically all the work, got a similar amount. If the court had appointed an accountant as receiver, he could have done the work equally as well on his own responsibility."

Mr. Wilson added that the Southern District of New York had a little group of certain attorneys known as the "Bankruptcy Ring," and another small group, he said, had a monopoly of receiverships.

Since the present bankruptcy laws came into being, there have been 35,654 bankruptcy cases in the southern district, more than half of which have occurred in the last fifteen years or so. It is estimated that from eighty-five to ninety per cent of these have been more or less fraudulent, varying only in degree. During the year 1922, more bankruptcy petitions were filed in the Federal Court for the southern district than in any previous year, according to the report of a special committee of the New York Credit Men's Association, which urged that the bar associations in the district "purge the bankruptcy law of the abuses to which it is subjected and have an immediate investigation made of the practices of attorneys in bankruptcy cases."

> A table which accompanied the report showed that fifteen attorneys or firms of attorneys filed 710 out of the year's total of 1,844 involuntary petitions in bankruptcy. In 596 instances in these 710 cases, these attorneys were also attorneys for the receiver and appeared for the bankrupt in at least 167 cases during the year. "It is readily seen," the report continued, "that fifteen firms have appeared at least in 877 of 1,844 involuntary bankruptcies filed during 1922, or nearly fifty per cent."

The credit men pointed out that many reputable firms of lawyers either refuse or fail any longer to handle bankruptcy matters other than to collect claims against bankrupt estates, because of the discreditable operations of the bankruptcy rings. They criticized the manner in which attorneys have been brought into bankruptcy cases as attorneys for petitioning creditors, the means taken in procuring signatures of creditors to the petitions, the practice of having the attorney for the petitioning creditors appointed attorney for the receiver and the attitude of some of these attorneys in endeavoring likewise to represent the trustee.

The Attorneys Do Well

AN INSTANCE occurred in New York only a few months ago, illustrating the eagerness with which numerous attorneys pounce upon small proceedings in bankruptcy. In this case the Associated Dress Industries of America strongly opposed the acceptance of a settlement of fifty per cent in cash offered by a retailer who had sustained a total loss by fire. Following the fire, he made an offer of thirty per cent to his creditors, which was rejected. The fifty per cent offer was made subsequently and was endorsed by a creditors' committee and accepted by some of the creditors. The amount involved was so small that the case could not possibly afford an expensive administration. The liabilities were from $8,000 to $14,000, while the assets consisted entirely of the insurance that had been collected after a dispute—just what amount had been collected could not be ascertained.

But, despite the smallness of the case, no fewer than four attorneys were concerned in it—all waiting for a share of a pie which could have been cut either without or with very little legal counsel. The debtor was represented by an attorney, the chairman of the committee was an attorney, the committee also had its counsel, and another attorney was a member of the committee. Of a creditors' committee of five, three were attorneys. It was commented that when professional bankruptcy lawyers "ring-in" four-strong in a case involving $8,000 to $14,000, there could be no doubt that the creditors would not receive as much as they were entitled to.

The Merchants' Association is making known instances showing how great a burden bankruptcy has been to its members, and how little is usually left to creditors after the costs are paid. Some time ago at a creditors' meeting, the committee of prominent merchants who were in charge found that the assets were so substantial that they rejected a settlement offer of forty-five per cent simply because the assets in sight warranted the rejection. But after the matter got into court and into the hands of receivers, the creditors were finally glad to get twenty-five per cent out of the wreck.

A practical example of the methods adopted by "fraudulent bankrupt rings" is shown in the prosecutions instituted by a group of New York dry goods firms against a set of men charged with having victimized wholesale houses of more than $200,000 in the last year. "Bennie" Zeikowitz, former owner of a dry goods store in Brooklyn, who disappeared when a petition in bankruptcy was filed against him, was indicted by a Federal grand jury on a charge of conspiring to conceal the assets of an estate in bankruptcy. With him were indicted on a similar charge his brothers-in-law, Philip and "Moe" Harris, and his father-in-law, Joseph Harris.

The dry goods firms, after having investigated the operations of the above men for four months, charged bluntly that they were the leaders of a bankrupt ring which illegally concealed their assets and took the merchandise supplied by the firms to places in Connecticut and Massachusetts, where they recommenced business. The creditors also assert that Zeikowitz, his relatives, and others, were involved in other recent bankruptcies, of which they named the following:

Rainbow Garment Company, which failed in May, 1922.

Avenue B Fashion Shop, against which bankruptcy proceedings are now pending in the Southern District of New York.

New York Garment Company, which went into bankruptcy in January, 1922.

Merchandise Has High Value

THE value of the merchandise involved in these three cases and the Zeikowitz bankruptcy, now before the courts, is stated to be more than $100,000. The attorney for the committee of creditors, intimating that an organized scheme existed to swindle certain dry goods firms, said:

"Although Zeikowitz had a business in Brooklyn, he disappeared when the petition in bankruptcy was filed against him in June of last year. He has never been produced in examination, nor has he filed any schedules in bankruptcy. In his case and in others it has been impossible to get hold of the principals. When the receiver took possession of his property, he found only $2,000 worth of merchandise and nothing in the bank. After months of inquiry by the creditors' committee and examinations by counsel, assets amounting to thousands of dollars were traced to Bridgeport, Connecticut, where they were found in a store on Main street, known as the Banner Shop.

"It appears that this store was opened by Joseph Harris and was being actively conducted by "Moe" Harris. That was in May, 1923. The Zeikowitz bankruptcy petition was filed in June, a month later. Between those dates, the merchandise had been removed at night by truck from the Brooklyn store and taken to Bridgeport, where it was identified by the creditors. An order was obtained appointing an ancillary receiver in Connecticut, whereupon the receiver seized the merchandise in the Bridgeport store and is now in possession of it. It was discovered that practically no accounts had been kept, and there was only a very incomplete list of creditors. The committee, however, made further investigations, and disclosed that there were 170 creditors, with claims of approximately $20,000. This is about the value of the merchandise seized by the receiver in Bridgeport, as constituting assets of the bankrupt estate, the removal of which is the basis of the indictments which have been obtained."

This is only one instance of hundreds of frauds which are being operated on similar lines. It is an exceptional "bankrupt ring" that is not being engineered by similar "Bennies" and "Moes," aided by their close relatives, and constituting the fraudulent group a "family business." These elusive parasites fade into the unknown, only to reappear at distant localities, bearing assumed names, spreading the extent of such corrupt business practices through the towns and cities of the country on an ever-increasing ratio. Having little to lose, they profit by their operations, and ultimately, having successfully fought off prosecutions with the connivance of their bankruptcy lawyers, they become established as substantial merchants. At the present time in New York City, the owner of a string of the most successful and flourishing cabarets in the Broadway white light district, made his original bankroll by similar operations, in collusion with his brother.

Few individual business firms can afford to pursue, unearth and prosecute such bankrupts. Where a group of firms undertakes to do so as in the instance given, it is merely done for punitive purposes. The merchants can never hope to get back either their original property, or enough even to defray the expenses of their investigations. Meanwhile general credit is impaired, confidence among merchants destroyed and business morality degraded to the vanishing point.

Such operations as described would be less extensive, were it not for the co-operation of the vulture type of bankruptcy lawyer, who is of the same race and kidney as the "Bennies" and "Moes," and is similarly degrading the profession he has adopted. John L. Redmond, of the prosecuting committee of the credit men's association, states: "On a number of occasions we have noticed that well-known bankruptcy experts, to whom crooked debtors fly when in trouble, have made it a practice of occupying the chair at informal meetings of creditors and proceeding to hand-pick the creditors' committee that will investigate the case and speak for the creditors. While such committees are being packed in this manner, the creditors simply sit around without nerve to open their mouths.

"When a bankrupt, after having issued false financial statements, made large payments to relatives on fictitious claims, or concealed a large part of his assets, gets away with a twenty per cent or twenty-five per cent composition, he spreads the news among his acquaintances in the same line of business and recommends to all those who want to get rich quick at the expense of creditors to employ the firm of attorneys that 'put over' his settlement."

This view is endorsed by the Committee on Unlawful Practice of the New York County Lawyers' Association, which in a comment on what it terms "justifiable criticism of abuses in the practice of bankruptcy," says that the foundation and origin of the abuses most complained of is the illicit and unlawful combination of laymen and members of the bar. "One such case which came to our attention, we referred to the Discipline Committee of our association. It was charged that an attorney had been habitually filing petitions in bankruptcy on alleged assigned claims of debtors, the assignees being clerks in his office. In the particular case in question, it was asserted that a bankruptcy petition had been filed against a solvent concern, the claims having been submitted by a layman employed by the attorney."

Harold Remington, a lawyer and author of a work on bankruptcy, in discussing the "wolves of bankruptcy" and the tactics they employ, said recently: "The real bankruptcy rings are not engaged in victimizing bankrupts, but quite to the contrary, they are engaged in aiding bankrupts to victimize creditors; and the exorbitant fees paid to receivers' and trustees' attorneys that are thus criticized, are exorbitant simply because they are paid not for intimidating or robbing bankrupts, but rather for inducing weak lawyers, whom bad bankruptcy schemers have succeeded in getting into important positions of trust and confidence in the estate, to wink at fraud and to be slothful in bringing bankruptcy scamps to justice.

"For example, a great proportion, though not all, of course, of the bankruptcy compositions or settlements in New York and its vicinity are merely collusive conspiracies among bankrupts and their relatives and friends, with the aid of certain lawyers, of whom, as in the membership of all professions, there are some of more or less easy conscience, to cover up fraudulent transfers, secret preferences, concealments of assets, false swearing and false financial statements, and the success of such compositions is bound to sap business morality, encourage dishonesty among merchants and undermine respect for the courts.

"Exorbitant attorneys' fees are not being paid to attorneys who honestly and efficiently prosecute bankruptcy frauds, dig up concealed assets, punish the perpetrators of false oaths and false financial statements, nor to those who are putting through compositions for bankrupts in an honest way. There is not as a rule adequate compensation for the practitioner who would stick to the straight and narrow path in bankruptcy. The only fair fees for attorneys in bankruptcy usually come through working for bankrupts in helping to 'put over' concealments of assets or some of the other fraudulent schemes above mentioned. Failing debtors, whether failing through their own fraud or mismanagement or the fraud or mismanagement of others, almost invariably try to put something aside from the wreck—try, in other words, to hide assets from creditors. To do this, they naturally have to have the aid of lawyers, because they are in court or are going into court.

Pity the Poor Creditors

"IF THESE attorneys for the failing debtor belong to the certain class of bankruptcy lawyer criticized, they will at once get other attorneys to represent some relatives or friends, often with fictitious or trumped-up claims of 'money loaned,' money kept in fictitious bureau drawers and trunks, and to file an apparently hostile 'involuntary' bankruptcy petition, thus in appearance 'forcing' the debtor into the bankruptcy court! In fact, however, in such cases the debtor is not 'forced' at all. He goes there willingly. It is part of the plan in such cases. Such a bankrupt has a proper confidence in the skill of his counsel, and knows that an 'involuntary' bankruptcy petition is not necessarily what its name implies—a hostile proceeding in behalf of indignant creditors—but is the gentle camouflage adopted by his own counsel to get a friendly administration.

"Thereupon the lawyers for these friendly 'hostile petitioning creditors' become attorneys for the receiver, who naturally cannot at the beginning of things distinguish them from genuine petitioning creditors' attorneys; and eventually these same lawyers—if creditors do not bestir themselves—will become attorneys for the trustee. Straightway, like the wolves in sheep's clothing that this class of bankruptcy attorneys are, they will start in to use their positions in subtle ways to frustrate bona fide efforts of outside creditors to investigate and expose the evils which quite commonly are being covered up by these 'involuntary bankruptcies.' Too often the ringsters among the practitioners in bankruptcy (for such class of bankruptcy practitioners constitute the real and only bankruptcy ringsters) seem to find apparent favor or indulgence with some of the referees and courts who evidently do not fully apprehend their real character nor the real harm they are doing to right bankruptcy practice."

Unless representative business has the courage to denounce the real racial significance behind the evil, it will continue to sap American business life.

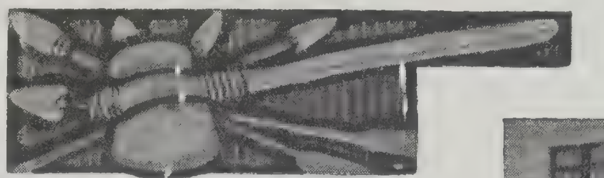
The California Piautes Stand Pat!

Denied Public School Rights, Citizens Work for Fair Play

By SADYE M. HAGEMAN

Waiting at the gate of the public school—where as citizens they had a right to go.

Eunice Hill, seventeen-year-old high school junior, dons overalls and helps her Dad measure hay.



The California Piautes who made their unique walkout from government school—made their unprecedented march to a public school, and were refused admission. As citizens they are standing pat while their case is in court. John Somerville is the man in center wearing a cap.

The citizen of today, three-quarters Indian. Anona Hill was graduated from Riverside Public High School at eighteen.

WONDER and tremors of anticipation thrilled the lone Main Street of Big Pine, a California hamlet, east of the Sierra Nevada Mountains. Early morning found parking space at a premium. Knots of men shook fingers in heated arguments, women's voices peaked to shrill whispers, children looked on in big-eyed mystery.

Ten o'clock—registration hour at the new $100,000 public school building. A company of Piaute Indians is seen marching with a firm tread toward the school-yard gate. Calm, quiet and dignified, the group of more than fifty men, women and children moved silently down the dirt street.

The waiting crowd heaved chests, pressed self-starters and followed. The Indians were making good their word!

Outside the school-yard gate, the women and children of the Indian company halted. The men continued their march to the foot of the school steps where a group of school officials stood armed—with the school law.

John Somerville, leader of the Piautes, for more than twenty years a voting citizen, a heavy taxpayer and a deputy sheriff of the county, stepped forward.

"Gentlemen," he addressed the school board, "we have brought our children to be registered in the public school. The government school does not measure up to the standard of the public school. Our children are making no progress there and we want them to advance the same as other children. We are bringing them to you clean. Each child has a health certificate from our county doctor. Will you receive them?"

"No, we reject them," came the quick response from the chairman of the board.

A moment of breathless suspense held the crowd.

"Upon what grounds do you reject them?" Mr. Somerville asked.

The chairman opened his book of school law and read, "—in school districts of California where the United States Government has established an Indian school, in an area not to exceed three miles from said Indian school, the Indian children of the district or districts eligible for attendance upon said Indian school may not be admitted to the public school."

Leaning his shoulders against the bulwark of the antiquated law, he continued, "You have your own government school within the three-mile limit. Therefore, we reject you from the public school."

"But," argued Mr. Somerville, "as citizens of California, as taxpayers, we are entitled to public school privileges."

"Here's the school law, though," the chairman stubbornly declared.

As the board defiantly faced that group of earnest Indian citizens they forgot something: forgot that when the call to arms came a few years ago, Indians, too, were called to fight for the honor of the flag—for the protection of American RIGHTS and LIBERTY. They answered the call—some ten or fifteen of them from Inyo County—Big Pine's own county—some took the tolls of war—shot and gas: forgot, too, that within the shadow of the school building lived an Indian youth who had been cited for bravery in action by General Pershing.

The townsfolk began to murmur.

"You can't teach Indians anything beyond the fourth or fifth grade."

"Indians are so slow and stubborn."

"Don't want MY children sitting alongside of Indians!"

"Well, we haven't enough teachers for OUR OWN children. How can we add twenty more pupils to the school?"

Thus the moral itch of the Big Pine American conscience was soothed.

Again, Somerville broke into a pleading tone. "We will use our own community hall, if you will furnish us with equipment and make us a public school. We don't want to put our children in the white people's school if they are not wanted there. We have nothing against the government teacher, it is the system we oppose. All we want from you is the chance for our girls and boys to progress like other children. They want to learn, too. Will you help us as much as you can?"

The moment was tense, dramatic, pulsating with pathos. The once proud owners of the great and glorious California, their eyes speaking the yearning language of their hearts for their young; the pitiful remnants of a race which the white man has so wantonly slaughtered by neglect, eviction from lands and disease; begging—not for alms or undue favors—merely asking for a chance to learn; waiting patiently for the cold refusal, the indifference, the race antagonism of their despoilers!

"The government school is good enough," came the final answer. "We reject all the Indian children applying for admission into our school."

Nothing to the school board that the government school represented a system established to meet the needs and capacity of the Indian child when his parents were wards of the government and untrained in self-reliance! Nothing to them that those twenty children of voting and taxpaying citizens, capable of managing their own affairs, were swept back to a school where children of fourteen to eighteen circle around in grades which the public school child reaches by the time he is ten or twelve years of age.

"We accept your rejection," John Somerville responded with even warmth, "but we will establish our rights as citizens if we have to go to the United States Supreme Court to do it. For not only the Indian people of Big Pine are back of my request that the Indian children be admitted into the public school the same as other school children, but every Indian in California stands with me!"

An excited buzz of voices filled the air as the Indian men turned toward the gate where the women and children were waiting—and hoping.

Against the gatepost leaned Eunice Hill, a seventeen-year-old Indian girl, a round-faced, bob-haired, winsome high school girl. When the sweeping rejection became known to her, a rouge of indignation burned across her unpowdered cheeks. With a determined step she walked into the midst of the crowd buzzing about the school steps and demanded, "What right have you to say that my little brother and sister cannot attend the public school?"

The rejoicing and doubting disputers were jerked into an expectant silence. The chairman of the school board again read the passage of school law referring to the government school.

Not enough to satisfy Eunice Hill's sense of justice, she took the volume of school law into her own hands and read, "—that all children between the ages of six and twenty-one, INCLUDING INDIAN CHILDREN, unless otherwise provided for by the Federal Government, may attend the public school."

The young Portia fastened her blazing eyes upon the chairman; "Now," she continued, "my parents live eight miles from the government school instead of within the three-mile limit. My older sisters were refused admittance into Sherman Government School at Riverside both by the Commissioner of Indian Affairs and the local government agent because my father is a taxpaying citizen! How can you keep us out?"

A new tingle of surprise to the inhabitants of Big Pine. "I didn't know that Indians were that smart!" a woman remarked in a half whisper.

With a clear direct gaze fastened upon the woman, the high-spirited Indian lass replied, "Two of my sisters graduated from the Riverside Public High School at eighteen. I graduated from a public school at twelve and will graduate from high school next year, just a few months before I am eighteen. Your white children don't do very much better, do they?"

A smile circled the listeners' faces and the woman addressed offered no answer to the challenge.

The girl turned toward the school board. "You can't keep us out!" she repeated. "If you do, you will force us to break the compulsory education law!"

"Well, we won't have Indians in our school," came back the dogged reply.

And then with the love of her own race, and the rights of her own brother and sister burning deep within her girlish heart, she flung her dare at them, "I have a right to come to your high school and if I come, I dare you to put me out!"

The Indian children have not gone back to the government school. When they turned their backs on the government school system, they meant business. Deep down in those parents' hearts there smoulders the pride of race, a hunger for a fair opportunity for their children, a square deal to their race.

The Indian Board of Co-operation, incorporated under the laws of the state and sponsored by such men as Dr. David Starr Jordan, of Stanford University, is organizing the Indians that they may strive for race betterment—physically, mentally, morally and socially; that they may, whenever necessary, make a united appeal to the United States Government. In three years more than nine thousand of the fifteen thousand or more in the state have welded themselves into a unified people.

Strong, capable Indian leaders have evolved from the organization of their abilities, warm, strong friendships have sprung up between tribes but a short while ago unknown to each other, a binding link of common blood, of common needs, is making the Indian citizenship a power to be recognized and dealt with fairly.

Government employes fearfully admit the power of organization among the California Indians. "It's spoiling our plan of work," they complain. "The Indians won't listen to us any longer. They want to manage their own affairs. Now, they are not satisfied with the government schools—they want the public school."

Well, in the name of fair play, why not? As citizens, recognized by both the United States and the state, why can't the California Indians run their own affairs? Why can't they take their chances to sink or swim as do millions of newly made Americans, to whom the customs of the country are far more strange than to the Indian people?

The Indian pupil who gets the right school start will make all the sacrifices that the white pupil will to advance. Many will pack their suitcases, leave their native haunts, go to the cities and work for their room and board to go to high school, to college or teacher's training college. One fourteen-year-old girl walks fourteen miles a day to public school.

Quietly, the Indian children of Big Pine are playing about their dooryards. Calmly, the Indian men citizens and taxpayers are working with fair-minded men who will help them establish their rights as they are enjoyed by all other citizens.

And while they're standing pat, the eight hundred and more Piautes of Inyo County are back of them, the entire Indian population of California will assist them in their fight for school rights and the Indian population of the United States will glory in their determination to gain the fair play that is due them.

Snowbound in a Southland

A Forest Land on Shores of Lake Arrowhead

Above—"If snowshoes are hard to manage there are skis to try."

Right—Reached by motoring from Los Angeles eighty-one miles.

Winter sports are the delight of Southland dwellers.

Lake Arrowhead—a Switzerland in beauty.

Circle—"Peace is here, the soughing of the pines the only sound to break the silence of the forest."

Right—The village in Lake Arrowhead Woods.

"SNOWBOUND" in its modern interpretation may mean bound for the snow, for it happens that in Southern California snow, because of its novelty, is very often alluring. And those seeking the snow find it in virgin beauty high in the Southern Sierras, in winter, and in a wonderful setting on the shores of Lake Arrowhead.

Lake Arrowhead, formerly known as Little Bear Lake, is a mile high in the San Bernardino Mountains, in a forest land called Arrowhead Woods. This mountain country is reached by motoring from Los Angeles eighty-one miles over such scenic highways as the famous "Rim of the World Drive."

The contrast of winter, in summer surroundings, no doubt adds to the charm of the place for, in verity, it seems that here is a Switzerland with its lake and snowy elevations, a sunny Italy with valleys of orange trees and roses below, to complete the picture.

The lover of the great outdoors finds here at Lake Arrowhead winter in all its loveliness. The forests of cedar, pine and fir stand protectingly about the borders of the lake, yet here and there give vista of snow-stretches unbroken in glimmering whiteness. Nature has made this country inspiring by the vastness of its timbered slopes, by the grandeur of water in lake and forest stream.

And then man has created, not to mar, but to enhance and guard this precious native beauty, an unique settlement of forest homes—cabins and lodges—where those seeking the joys of the snow may have shelter and comfort. A quaint village has been built about the shores of the lake, each structure following faithfully the designs of early Norman architecture.

The picturesqueness of this village high in the mountains is indeed appealing.

Winter sports are the delight of all who come here. Snow carnivals are included in the revels indulged in by the merrymakers at the holiday season. If snowshoes are hard to manage, there are skis to try. And tobogganing and skating are favorite pastimes, though a "summerland" is only a short distance away.

Those who have been outdoors all day, tramping through the forest and across the levels of snow, find the cheery blaze of hearth fires welcome at night. And peace is here, the soughing of the pines the only sound to break the silence of the forest.

Mr. Ford's Page

IF BY "parties" we meant the people who make up the parties it would be a very simple matter for anyone to tell what party he belonged to, or which party he was "for"—he would be for all the parties, since he would be for all the people. But parties no longer mean the people who are enticed to vote this way or that, they mean the skeleton organization, the directing heads, the beneficiaries who will eventually parcel out the offices among themselves and divide what they call the "rewards" among so-called loyal party men.

The party organization, then, which is not the people who vote, but the official group which is contending with another official group for a set of public jobs—it is this party organization that we mean by the "party." So that when the question is asked, "Do you belong to the party?" all thoughtful persons say, "No, we have more respect for ourselves than to belong to those men." One has only to start with the ward boss, go up to the city boss and the state boss, bunch them all together and look them over. When one has done that one says, "What! Belong, be owned by that crowd! No, sir!"

Belonging to a party, in this sense, would not be confessed by anyone. To say that the skeleton group known as the "organization" owns him would be more than any man would care to admit. Because he knows that no one owns him. And the skeleton group knows that it owns no one, too. That is probably the most important political development of the times, that it is now dawning even on the bosses that there is no one left to boss except the underlings who are hopeful of jobs.

Belonging to a party because a party stands for a certain principle or a certain program is quite another matter. Party membership used to mean just that. All of us remember staunch party men who were Believers, and that was what made them party men; they were Believers, not camp-followers or mere victims of rosy political promises; they stood for something.

PARTIES have always begun with Believers in a principle; they have been carried on by builders of that principle into the public life; then, successful, they have been invaded by the self-seekers whose standard of political achievement is office-holding; last of all they become mere controllers of the patent-rights of political machinery, and rent the use of their power to anyone contributing support by votes or money. The people rebuke the parties one after the other, by defeating them, by deftly swinging the "silent vote," by spasmodic efforts at reform. Then arise a multitude of little parties, formed around class and race interests, and these "blocs" dicker with the controllers of political machinery for support. That is the last phase, and anyone may observe it by looking around.

Perhaps the life of parties could be charted somewhat like this: in the beginning are the pioneers of the idea; then there is the period of invincible public strength when the ideal is being realized; then comes the dangerous period when the party, as a successful movement, attracts self-seekers who want to *use* the party rather than support the ideal for which the party stands. Then *office* becomes the standard of success, and to obtain it everything is sacrificed, promises take the place of performance, an inside circle assumes the power, and the very name of "politician" becomes a stench. That is the last stage of parties which have fulfilled their purpose or lost their ideals.

And what of the people during this last stage? The people simply go shopping among the parties, picking now this one, and now that one. The people figure for a time that by "rebuking" a certain party, that is, by defeating it at the polls, they will teach it a lesson. But they soon find that this does no good. Then they adopt the plan of switching parties at every election, so that campaigning becomes not a matter of education but a matter of guessing which way the people are likely to jump. Back and forth swings popular support, year after year, until the idea becomes definitely settled that neither party means well, that both have succumbed to the business of politics which is the business of holding office, and that neither is sworn to the service of the people.

More than that occurs, however. "Party" ceases to mean what it has always meant—one of the great divisions of political opinion. In this sense the very word "party" becomes not only unpopular but suspicious. Yet, the thing itself does not cease; something comes to take its place. Instead of two great parties, we have numbers of little parties, each built around a single purpose. Whereas the former great political parties contained within themselves the various aspirations of the people, now each separate aspiration begins to build its own party. Sometimes they are called "blocs" or "propaganda" or "programs," and they range all the way from organizations of business interests, like farming, to organizations of religious interests, and organizations of racial interests, and organizations of class interests. We don't get away from parties at all, we get into a more complex system of little and conflicting parties. It needs only a casual glance over the nation to see how completely developed this stage has become today.

Now, curiously enough, this does not mean the end of the former political parties. Blocs may multiply without end but the Republican and Democrat parties still stand as the political machines through which the grist must pass before it becomes more than dust in the wind. Ceasing to be the originators or protectors of the people's aspirations, these great parties themselves go shopping among the "blocs" to choose from among them a sort of crazy-quilt program in return for the votes of the various programs thus favored. You will find that going on today. The sharp managers of the great parties, so to speak (we really mean the well-entrenched groups of practical politicians who control the political machinery of the country and who therefore rule it for the time being), go around among the various cries and say, "Will all the believers in your cry vote for us if we broadcast your cry for you?" Thus is government farmed out. Thus are parties armed and equipped today. The parties themselves have nothing to sell but the use of the "organization." They rent that temporarily for a payment which consists of votes. They are mere merchants of the control they have seized from the people; they have, as it were, the patent-rights on the whole machinery by which the will of the people gets itself translated into the action of the Government.

That is the last phase. It is sheer peddling of influence in return for votes, and it is a disgrace and a shame both to them that give and to them that take. Moreover, it marks the end of every system that endorses the practice by indulging in it.

You can trade with the parties today, but you cannot follow them as leaders, as defenders of the common good.

We have lived to see in this country the complete reversal of the functions of government. Nowadays the theory is that the people exist for the sake of the government. At every turn of the legislative wheel the bond is drawn tighter upon the people. More and more are the people's resources sought out that they may be drained into the government. The ruling organization has exalted itself as a hierarchy, a political aristocracy, in whose glories the people ought to be thankful to bask, however high the cost. And the fact is, the Government does little or nothing more than it did for the people previous to the Civil War, and does much of it less efficiently. The reversal is due to one thing—the change of ideas. The country needs to hear from coast to coast the fundamental American principle, *people were not made for government, but government for people.* The power to govern is what the parties strive for, and we sell them that power in exchange for a time-serving approval of certain "bloc" cries during the short period of a campaign.

As it is, the people of the United States have given no party any mandate for years. In the last Presidential election the false prophets read the signs to mean that the people repudiated the League of Nations. The election meant nothing more than unrest, and no one knew this better than the President who has passed behind the veil. It is partly up to the people, first to give a mandate, then in their sovereign might to see that it is obeyed.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Thanksgiving

CALVIN COOLIDGE, heir of the moral spirit which made America, has spoken well in his Thanksgiving Proclamation, and has made it more than the official notification of the people that Thursday, November the twenty-ninth, is Thanksgiving Day.

Given opportunity, he says, to balance the good and the evil which we have experienced, "we have never failed to find reasons for being grateful to God for a generous preponderance of the good. Even in the least propitious times, a broad contemplation of our own position has never failed to disclose overwhelming reasons for thankfulness . . . . We have been a most favored people. We ought to be a most generous people. We have been a most blessed people. We ought to be a most thankful people."

This is true, how true only few of us can realize. If our people knew and realized the vast mental and physical misery of the world, the realization would take all comfort out of their own situation, although it would leave them deeply thankful on behalf of our women and children. Not only reverent and humble gratitude befits us, but also a profound self-searching as to what compensatory service this signal immunity from suffering commits us. It is not for nought that we are free. Our very condition emphasizes a deep responsibility laid upon us as a nation.

The Straws Show
